MEXICAN DOLLARS.—The market is dull but fairly steady around 77½ cents. Some importers are firm at a slight advance.

QUICKSILVER.—Receipts the past week aggregate 160 flasks. The market is reported steady.

SILVER.—The market closed the month of August dull and heavy, entering September with the Government buying at a slight advance. The very low prices ruling in this country, and also in Europe, is an anomaly, and yet we still believe that much higher prices will be seen before the year closes. There are those in this country who think that mining share manipulation has something to do with it, for it has been noticed that when these securities went up silver went down, or else hung heavy, but with shares going down the metal went up. Whether this is a coincidence or not we are not prepared to say, but still the movements of the two have been in opposite directions. Russia is to issue, so says telegraphic advice, 50,000,000 paper rubles against the silver held by the Government. If this proves to be correct, then Russia's holdings are out of the way.

BORAX.—Receipts the past week aggregate 225 cts. The market is said to be steadier. In Eastern Washington a rich deposit has been found, which it is contemplated to work.

LIME.—Receipts the past week aggregate 2658 bbls. The market is firm under a good demand.

TIN.—1075 boxes plate were received the past week by railroad from New York. The market is dull but steady for plate, and easy for pig. English advices report small orders for plate from this side. The stock here and at the East is large, much of which is held for next season.

LEAD.—The market does not exhibit any change worthy of special mention.

COPPER.—Contrary to expectation in many quarters, the market not only did not go below \$12 for Lake, but has made a slight advance. London cables report that "the future of prices appears to depend greatly upon American supplies, which have recently been larger than expected. Any lessening supply from that quarter would probably strengthen the market. Demand from consumers is moderate."

IRON.—The market is in buyers' favor, under fair stocks here and large consignments afloat for this port. The coosumption is large, both here and up North.

COAL.—Imports the past week aggregate 16,587 tons, distributed as follows: From Departure Bay 4,850 tons, Seattle 2,304, New York 272, Liverpool 3,220, Tacoma 2,000, Nanaimo 2,484, Coos Bay 1,175. The market is barely steady for cargoes in all positions. Steady additions are reported to the coal fleet from Australia. The high charters ruling here for wheat are drawing coal vessels to us. Several large consumers are not anticipating their full requirements for they believe that many vessels will come coal laden, whose cargoes will have to come on an open market after arrival. It is only by concessions they are tempted to buy for wants from three to four months ahead.

Mining Share Market.

Mining shares the past week were dull and heavy. Under a prearranged concert of action, the pool through cross orders succeeded in quoting the Gold Hill stocks, together with Potosi and Bullion, at lower prices. This was done so as to uncover several lines of stocks carried on a margin. So far as we can learn, they have not brought these stocks down to as low a point as they contemplated, and therefore outside dealers had better be careful about overbuying. The trouble with the latter is they are too hoggish, and in trying to get too much, they come out in the end with comparatively nothing. The fact must not be lost sight of that the mines are in too good condition to let outsiders have the stock to any great extent, and the old freeze-out and scare-out games are being resorted to; but those who have the courage to hold on and not be frightened, or frozen out, will, it is claimed by well-informed miners, come out considerably ahead. The water in the Gold Hill mines, it is said, could have been, if desired, pumped out long ago; but had this been done, there would be no plausible excuse for levying assessments and also making her raids to frighten holders. In well-informed circles, it is asserted that in Yellow Jacket they uncovered in running west very high-grade ore, and its continuation was found in Crown Point. Of course, the bear movements in the market have been to get stock better concentrated. In Overman, we have not heard of their crushing the ore going from \$50 to about \$100 a ton, which was officially reported last year. If it was taken out and milled there, the returns do not show it. In this mine, as in several others of the Gold Hill mines, very rich ore is known to exist on the lower levels, and as the water in the mines will be out before the close of the year, there does not appear to exist any excuse, unless it be to loot the mines for not showing it up. In the west workings of Confidence, Challenge, Con. Imperial and Alpha, rich ore—gold-bearing—is known to exist. It is said that several of the upper levels have been more or less looted, but the lower levels, it is claimed, have not been.

The officials of these mines may possibly get themselves into as bad a fix, as is said by many persons who ought to know, as are the officials in one or more of the Middle mines. It is a dangerous experiment by mine trustees not to keep well informed on the working of the mines they are elected to look after. Ignorance is no excuse in law.

It is to be regretted that the papers noticing Col. Mackey's movements so as to give color to the movements of the stock market, did not state that it is said when he had a toothache, and not having anything convenient to knock in his paroxysm of pain, knocked the Gold Hill stocks.

A subscriber to the PRESS sends us a communication in which he says: In the interest of that much-abused race, Russian Jews, and to relieve the Czar of further trouble in the matter, I beg leave to suggest through your columns that they be sent to California and placed on the pay-rolls of the Savage and Hale and Norcross mines.

We are informed by good authority that a person with ample means is prepared to enter into an agreement with the Comstock mines to reduce their ores (which includes transportation charges) at \$4 a ton, and return 80 per cent of their assay value, provided the mines will agree to furnish enough ore to keep the mills which he will have, running.

The market opened this (Thursday) morning inactive. After its regular call there was no change to report. Those in position to know say the pool is taking in stock, yet they believe still lower prices will come before any decided up movement sets in.

From the Comstock mines our advices report that nothing much is expected to result from the west drift now being run in Sierra Nevada, but when west work is resumed, on or about the 1400-foot level, high-grade ore will be uncovered. In Union, Mexican and Ophir, rich ore can be shown up at any time, but the pool is killing time so far as work is concerned. The work reported in Cons. Virginia does not indicate that the high-grade ore reported by Patton in the last year of his superintendency is to be shown up. He reported that in the lateral or marginal drift the ore extended from Ophir to Best and Belcher, and that it was from 12 to 18 feet wide. Private but reliable advices are very sanguine about the work in Savage and Hale and Norcross, and that they can, at any time desired, show up very rich ore on several levels. Of course, if the share market was high, we would not believe all that is reported, although coming from undoubted sources, but as prices for many shares are about as low as they usually get, more credence is given them.

In outside mines the work going on is interesting, particularly in the Bodies. It is claimed that after they are assessed, these shares will do much better. It is said that the Iowa mine claim was relocated in May, 1890, under another name, by Mr. Steel of the West Cons. Virginia mine.

IMPROVED KNIGHT WHEEL.—Knight & Co. are out with another improvement upon their excellent water-wheel. They have got a wheel, four feet eight inches in diameter, which will develop 100 horse-power with 2500 cubic feet of water per minute under a head of 27 feet. This is the best result so far achieved by any wheel. The improvement is owing to a circular nozzle which encircles one-half the wheel, and a widening of the buckets. The wheel is to be shipped in a few days to a mine in Yreka, Siskiyou county.—Amador Ledger.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE NAME ON YOUR PAPER.

The report of the discovery of the Lost Ohio mine, on the shore of Klamath lake, Oregon, turns out to be a "fake." That mine has been rediscovered scores of times on the same basis.

MECHANICAL PROGRESS.

American Workingmen.

Sir James Kilson, in a recent communication in the *Contemporary Review*, gives the following opinion of American workingmen and their "hosses" from an English standpoint: "Every one agreed that the American skilled artisan puts forth more physical effort and produces more work in a given time than the English workman, or the workman of any other manufacturing community. This fact struck me and many experienced directors of works most forcibly. Before concluding our tour I had the opportunity of verifying and strengthening this first impression. After watching the American workmen at Pittsburgh and elsewhere, I arrived at the same conclusion as to their efficiency. Their productive power is greater than that of the English workers in the same time, and their working hours are longer and their remuneration greater. I met one of my old workmen at Mr. Carnegie's works in Pittsburgh and he endorsed my opinion, speaking from his own practical experience.

"I am quite a different man here," he said, "from what I was in the old country. I don't know why it is so; whether it is that I live in a stimulating atmosphere or whether it is the example set me; but I know I have got the go in me here. I can do more work; I feel that I have it in me; but I also feel and know that it won't last. I shall be done in ten years."

No, it won't last. The extreme physical effort puts forth results in greater production, but it saps the vital energies and cuts short the career. This continual work at high pressure does not pay in the end. "It won't last," and the remark applies with equal force to the employers as well as to the workers. Competition between manufacturers is keener than in this country. They work their business at high pressure. There is a terrible struggle between them for the possession of the markets. They put forth their utmost energies, and when they succeed their reward is great; but all cannot be the leaders in industry. This fierce competition reacts on the men. We were surprised to find in a democratic country like America, that the workmen had so little power and were to such a large extent the docile instruments of energetic employers. The "hosses" have the faculty of "driving" the men and getting the maximum amount of work out of them, and the men do not seem to have the inclination or power to resist the pressure.

Cast Iron—It is a Child of the Dim Past.

Few quotations occur more frequently than "There is no new thing under the sun." All admit its force with regard to abstract thought and to political organization. We are, however, says a contemporary, disposed to flatter ourselves on our advance in mechanical science. Even here, however, the relentless antiquarian is continually showing us that we build on ancient foundations. Great ideas existed for centuries past, even though it has been reserved for modern times to carry them into effect. That the Hebrews, Greeks and Romans had some idea of the value of iron is universally known. About half a century ago metallurgical students declared that, ancient as metal weapons might be, cast iron was a distinctively modern product. This, as far as Europe is concerned, may be true, cast iron statistics going back no farther than the latter part of the fourteenth century. After prolonged study, the late Dr. Gurlt, of Bonn, concluded that cast iron is a child of the dim past. In China, wrought iron and steel were known 2,000 B. C., and cast iron about 400 B. C. A Chinese author describes the process at length.

In the first century of the Christian era, a Chinese ravine, 1,000 feet deep, was spanned by a compressed bridge with cast iron columns. Cast iron is mentioned by Aristotle and Pliny. The Greeks and Romans do not, however, seem to have used it extensively, judging from the fact that while wrought iron relics are common, cast iron relics are rare. Dr. Gurlt is none the less convinced that investigation will disclose many more such relics. He describes a little statue, representing a priestess of Isis, or the goddess Isis herself, which he supposes to have been made by an Egyptian craftsman or under Greek-Roman influence. Cast iron has also been found in parts of Moravia where the ancient Celts mined, under the direction of their German conquerors. Hitherto the men who have made archaeological researches, have generally been governed by a desire to obtain historical or literary information. The industrial treasures of antiquity are comparatively little known. It is likely that much more will be found.

ROLLING-MILL IMPROVEMENT.—A most notable and valuable improvement has been made in rolling-mills adapted for structural iron or steel, and particularly beams which are I-shaped in cross-section. Such beams are used now by the thousand, being the most serviceable form for general structure. This form of beam is, by ordinary rolling-mills, hard to form perfectly in very large sizes, and its production is attended with great disadvantage. Large beams of this class are therefore built of straight web sheets, with angle iron riveted on to give lateral strength. By the present improvement the beams can be made of any size and in

perfect finish, with great facility and results, both in speed and quality attained, hitherto unthought of. The novel and conspicuous feature of the implement consists in the management of a pair of rolls rotating in a horizontal plane on vertical shafts, these rolls being journaled in such contiguity to the horizontal rolls that their peripheries all turn in to form the transverse outline of an I beam. In this arrangement the horizontally rotating rolls form the top and bottom faces of the I, while the web faces are formed by the horizontal rolls. The housings of the horizontally rotating rolls are arranged for lateral adjustment, being movable along slide-ways and adjusted by screws. The arrangement is most admirably effected without interfering with the bearing of the horizontal rolls, yet securing perfect concurrence of action at a common point of compression, and subjecting the entire surface to a clean, clear action. The mill is a marvel of compactness and power, no improvement seeming possible. Mr. J. Reichmann, of Chicago, Ill., owns the patent.

WHY DOES SOLID IRON FLOAT ON MOLTEN IRON?—This question, which has puzzled a good many observers, was satisfactorily explained by Dr. Anderson, in a recent paper on steel, read before the Iron Institute, London. When a piece of solid iron is thrown into a pot of molten iron or steel, the solid metal at first sinks, which shows that its volume is less than the melted metal; but soon the solid piece becomes heated, which causes it to expand. Its volume is increased, and it rises and floats on the surface of the molten mass. The action is the same both with iron and steel. Mr. Wrightson said: "The experiment was frequently made by throwing a piece of iron into melted steel. They could see it go down, and might think that it was on account of the impetus which the iron had attained in falling that height, but as a matter of fact, if the iron were put upon a fork and lowered, it would go down; but in the course of a few seconds it came up again, and kept on expanding until the piece of iron was a considerable distance above the surface of the metal; then it decreased in volume, and of course became of the same volume as the molten metal which it joined. Any one could see by the distance that the piece of iron went above the surface that it was of considerably less density than the molten metal."

THE LARGEST ARMOR PLATE INgot ever cast in this country was recently turned out at the works of Carnegie & Co. near Pittsburgh. The ingot was 80 inches wide and 23 inches thick, weighing 32,000 pounds. It was cast in a sand mold for a test, and the material proved much superior to that tested in a metal mold. Heretofore there has been a great deal of trouble in casting in metal molds, owing to the many flaws. An ingot cast in the sand mold was found not to contain a single flaw. It is more than likely that hereafter sand molds for turning out armor-plate ingots will be adopted. Sand is universally acknowledged to be the best material for molds in which to cast iron. Iron or other metallic molds chill the iron, and it does not fill well. The great heat at which iron melts burns any other material, or it will stick so as to break the mold. The success of this experiment on so large a scale is considered an important advance in heavy foundry work.

AMERICAN SCREWS IN ENGLAND.—London Iron is authority for saying that the American Screw Co. of Providence, R. I., has made arrangements for the establishment of a large factory at Leeds, England, for turning out the class of screws which has heretofore been manufactured only at their works in Providence. The demand for these screws has become so great in England that the above move has been considered imperative. The machinery for the factory will come from this country, and be adapted to the requirements of English joiners and manufacturers. The finished wire used in the manufacture of the screws will at the start be obtained elsewhere; but the scheme of the company includes the construction of wire mills and annealing furnaces alongside the screw factory.

A BURGLAR'S OUTFIT.—It is said that a thorough outfit for a burglar's kit embraces over 100 tools and processes, the most of which are marvels of ingenuity and scientific knowledge. The police of New York recently captured an outfit which consisted of a little giant knob-breaker, a diamond drill and a high explosive of the nature of dynamite, but put up in the form of a powder. It would open the strongest safe in a half hour, and without noise enough to disturb the people in the next house, while the entire outfit could be carried in the pocket of an ordinary coat.

A NEW USE OF ANTI-FRICTION BALLS.—In a new bicycle tyre the wheels, instead of being fitted with pneumatic or cushion tyres, have the grooves fitted with a complete cycle of balls, which revolve on pivots fixed in the groove of the wheels. These balls bite the ground, and the machine travels up or down hill with wonderful celerity and ease.

PAPIER MACHE oil cans which are now being made are very durable, and impervious to any spirit or oil likely to be used in a machine room.

A NEW RIVET in the form of a tube, to be used both as a rivet and as a drainage way, is the wrinkle to iron shipbuilding.

SCIENTIFIC PROGRESS.

Artificial Rain-Making.

It is reported that the Government experiments now in progress in Texas have been partially successful in the efforts to produce rain artificially. Repeated explosions were made high in the air on Monday August 10th. About ten hours later heavy clouds gathered and rain soon fell over many miles of surface; but the experimenters do not feel perfectly assured that the explosions were direct agents in producing the clouds. They merely claim that they were instrumental in precipitating the moisture from the clouds, and greatly increased the intensity and extent of the storm. The experiments will be continued until satisfactory conclusions can be drawn therefrom. The explosive used was gun powder; but we presume other kinds of explosives will be used as the experiments proceed. The final result is looked for with much interest.

The Possibility of Producing Rain

By concussion, from a cloud already fully saturated with moisture, is thought by nearly all scientists as a reasonable probability; but what is so ardently desired and really sought for by those who are advocating these experiments, is the production of rain from an area of dry atmosphere. This matter is discussed at considerable length in the following communication, which has been received the past week:

EDITORS PRESS:—If the following article in relation to causing a rain storm by the explosion of certain compounds in the atmosphere, is of sufficient interest for a place in your valuable journal, please insert it.

Various writers have recently given an explanation for this phenomenon, by stating that the fall of rain under such circumstances was an effect of concussion, but not one of them has explained why rain should be produced as an effect of such atmospheric concussion, or of the operation of any natural law that could produce it. For such reasons we incline to the opinion, that rain under such circumstances is not the effect of concussion. The fact has been observed that in many instances rain has followed heavy cannonading, and for this reason it has been taken for granted that it was produced by atmospheric concussion, that is that the concussion produced by one explosion of certain compounds, has the effect to cause a condensation of the vapors held in suspension in the atmosphere and of falling in the form of rain, but by what law the condensation of vapor can be produced by concussion, as I before mentioned, has never been explained.

Now what is understood as condensation, is the uniting or bringing together the particles of vapor into such a mass or quantity, that by gravity they are caused to fall in the form of rain. For instance in the steam engine, the water of the boiler by the means of heat is converted into steam or vapor, but in order for such steam to be of practical value, it must again be restored to its original condition or in other words condensed, which is accomplished by being suddenly cooled, the particles of vapor are thereby caused to unite and the steam is thus transformed to its original condition of water. But I do not believe that an instance was ever known of its having been accomplished simply by concussion.

In order however to understand the nature of the forces in operation which may possibly cause the fall of rain by the explosion of certain compounds, it is necessary to understand the nature of air and of water or of the elements of which they are composed. Chemistry teaches us that water is composed of the two gases oxygen and hydrogen chemically united in certain proportions and that under no circumstances can water be produced by a combination of these two gases, excepting when they are chemically united and in the proper proportion. The fact that the atmosphere is a simple mixture, merely of the two gases, oxygen and nitrogen, and not a chemical compound is the reason why the hydrogen gas set free by an explosion is enabled to form a chemical combination with the oxygen of the atmosphere.

Now experiments by chemists have demonstrated the fact that when oxygen and hydrogen are mixed in the proper proportion and exposed to great heat, either by the combustion of certain substances or by the electric spark, these gases, by the operation of a mysterious law, will unite, and water will be produced as the effect of such combination. It is in the operation of this mysterious law that enables us to form some idea of the nature of the phenomenon in question or why rain should be caused to fall by the explosion of certain compounds in the air above.

For instance, if certain substances which contain in their composition a sufficient quantity of hydrogen gas are caused to explode in the air above, this gas is set free, and in consequence of the great heat produced by the explosion, a combination of the oxygen in the atmosphere with the hydrogen thus set free is effected, and in accordance with the natural law governing these two gases, water is pro-

duced, and by gravity falls in the form of rain.

This, however, is not a new discovery, since Priestly long ago made known the important fact that, although water was composed of the two gases oxygen and hydrogen, yet they would only unite under certain conditions, viz., either by combustion or by the electric spark.

The reasons for this are as yet little understood, although it may be due to the fact that, in order to form a compound of two or more elements, or, in other words, a combination of them, it is necessary that the atoms which compose them must bear a certain ratio in their motions, and since it is evident that the atomic motions of oxygen are much greater than those of hydrogen, it therefore becomes necessary, in order to form a combination of them, that the atoms of the latter should receive an accelerated velocity corresponding to the former; hence arises the necessity of an explosion for the purpose.

We are further informed that rain cannot be produced by such explosive compounds in a dry atmosphere; but if the phenomenon of rain is not the effect of concussion, but is due to the combination of the above-mentioned gases only, it is evident that rain can be produced in a dry atmosphere as well as in one saturated with moisture.

Although, as before mentioned, the fact that water could be produced by an explosion was discovered many years ago, yet the process is new in its application, and, under the proper conditions, may no doubt be made very serviceable and of great value to suffering humanity upon portions of the earth's surface where severe and protracted drouths are the rule.—C. W. HASKINS, Oakland, Aug. 15.

The above communication expresses the opinion that mere explosions, designed to produce concussions only, will not cause rain; but that explosives containing mixtures which will liberate large quantities of hydrogen gas will, by a union of the hydrogen thus liberated, with the oxygen of the atmosphere, produce a quantity of moisture which will form a "nucleus" for the concentration of a much larger quantity of moisture which is always present in the atmosphere, even in its driest condition, and thus rain will follow. But when we bear in mind the fact that there is no substance known which can be elevated in any practicable quantity to any considerable height, and exploded so as to produce more than say two cubic feet of water, the "nucleus" cannot be very great or widespread in its influence. Still, as in these wonderful days of scientific progress and investigation it is dangerous to pronounce anything an impossibility, we must regard even this rain-producing theory as a matter that should be thoroughly studied and experimented upon, all unscientific and improbable as it appears to be.

THINKING A HOLE THROUGH A BOARD!—As is remarked by the *Industrial Herald*, "wonders will never cease in this progressive age." New illustrations of this remark are constantly coming to notice in almost every department of research and industry. It is only a few days since the *Electrical Review* of New York made the announcement that "Here, in New York, within a few weeks, we have seen pictures of sounds and have heard the sound of colors!" A new and still more startling announcement has recently been reported and brought to light by the performance of a celebrated electrician, who, having stated that he could "think a hole through an inch board," and was hooted at for so doing, connected a drill so that it could be actuated by the current produced by "the heat of thinking," and actually did what he asserted, so it is said. Later reports state that he was not the first to try the experiment, which was carried out more than 20 years ago by Dr. Lombard of Harvard College. The mental effort involved in the acquirement of important branches of learning is now to be measured by this means. A delicate astatic galvanometer needle is connected with a thermopile, which is placed close to the head, and every change in the temperature of the skull is faithfully recorded by the galvanometer needle, thus enabling the measurement of thought by means of the heat developed within the brain acting upon the thermopile.

A PROUD PROPHET.—A contemporary very truthfully says: No prophet beholding the overthrow of a city, which he had predicted, was prouder than Lieutenant Finley, who foretold almost to a minute the overthrow and annihilation of the late hot wave, which came down like a wolf on the fold from the torrid, treeless region of Southern Oregon. Saturday morning, Aug. 22d, Lieutenant Finley said that the warm wave would continue over Northern California until noon Sunday, when it would be followed by decidedly cooler weather and fog in the evening. He gave as a reason for his forecast the appearance of a cyclonic disturbance, moving eastward from Vancouver island, which would cause a decided fall in the barometer over Washington and Nevada, and it was even so.

THE CAMERA IN SURVEYING.—The Surveyor-General of Canada, Mr. Deville, has adopted a novel method of surveying in the Rocky mountain region of the Dominion. It is to photograph the country by a specially designed camera. He considers the photographs as accurate as a plan laid down by means of a protractor.

GOOD HEALTH.

CRAMPS IN THE LEG.—Many persons of both sexes are greatly troubled with cramps in one or both their legs. It comes on suddenly and is very severe. Most people jump out of bed (it nearly always comes on either just after going to bed or while undressing) and ask some one to rub the leg. I have known it to last for hours, till in despair they would send for the family physician; and even then it would be hours before the spasm would let up. There is nothing easier than to make the spasm let go its hold, and it can be accomplished without sending for a doctor, who may be tired and in need of a good night's rest. When I have a patient who is subject to cramp, I always advise him to provide himself with a good strong cord. A long garter will do if nothing else is handy. When the cramp comes on, take the cord, wind it around the leg over the place that is cramped, and take an end in each hand and give it a sharp pull—one that will hurt a little. Instantly the cramp will let up and the sufferer can go to bed assured it will not come on again that night.—*Dr. St. Clair.*

CRAZED BY MOSQUITO BITES.—Alexander Gordon, a fancy goods dealer at Elizabeth, N. J., became a raving maniac from loss of sleep caused by the tortures he endured from mosquito bites, combined with the intense heat. He ran along Broad street, dressed only in a pair of trousers, and terrified pedestrians by his wild actions, climbed over barbed wire fences on Spring street, and raced through yards yelling like a demon. When finally captured at last by the police, he tore off the only garments he had on, and it was necessary to wrap a rubber blanket around him to get him to the County Jail, where he had to be put in a strait-jacket. It is said his blood has been poisoned by New Jersey's venomous pests.—*N. Y. Commercial.*

A TOOTHPLICK IN THE THROAT.—John J. Ramsey of Newport, Ky., met with a peculiar accident recently. He had just finished eating supper, and had a wooden toothpick in his mouth. He laughed at some remark, and the toothpick, which was short, slipped into his throat. It lodged in his windpipe. All efforts to dislodge it proved unsuccessful. The following night he underwent a surgical operation, and the obstinate bit of wood was removed. Too much care cannot be used when putting foreign substances in the mouth.

WHY ARE FARMERS STIFF JOINTED?—Old farmers grow stiff-jointed and bent, not by hard work so much as by the utter neglect which most of them give to the rules of hygiene. Too little attention is paid to health matters by people in general. By proper study and care, the average of human life might be extended to one-third more than it now is.

DANGER FROM SNEEZING.—The physicians at South Charleston, Ohio, are baffled by the case of a girl who is literally sneezing herself to death. She seems to be the victim of some strange nervous affliction, together with hay fever and with the lingering effects of a severe case of the grip, with which she was afflicted last winter.

DANGER FROM A WASP'S STING.—A Soranton (Pa.) boy is in a critical condition and may die as the result of being stung by a wasp on the hand. His arm up as far as the elbow is swollen to twice its natural size. Should the swelling extend to the body, which is probable, death will ensue.

FOR TENDER FEET. take two quarts of cold water and add one tablespoon of bay rum and two tablespoonfuls of ammonia. The feet should be soaked in this for ten minutes, throwing the water upward to the knees. Rub dry with a crash towel, and the tired feeling will be gone.

DEATH FROM A FLY BITE.—A fly caused the death of a man at Vienna. He was walking when the insect suddenly took a position on his forehead. As soon as it left, a swelling appeared, and the man soon afterward died of blood-poisoning.

ON WHICH SIDE TO SLEEP.—A medical writer says that at least nine men out of every ten sleep on their right side, because by so doing digestion is aided and the action of the heart is left undisturbed.

VEGETABLES FOR STRENGTH.—Most of the operatives at the Rembrandt Iron Works at London who have anything to do with the heaviest work subsist principally on vegetables.

FOR A BOIL.—The skin of a boiled egg is said to be a good remedy for a boil. Carefully peel it, wet and apply to the boil. It draws out the matter and relieves soreness.

CURIOUS CAUSE OF SEASICKNESS.—It is said that old sailors are made searick by the excessive amount of vibration caused by the propellers of some of the high-speed cruisers.

HUMAN LIFE.—A scientist says the average term of human life has increased in the last 50 years from 34 to 42 years.

THE WATCHMAKER.

EVERY DECADE HAS ITS FASHION.—Only 20 years ago it was the ambition of the ordinary mechanic with good wages to own a gold watch. I am not so old but that I can remember that in those days the possession of a gold watch by a wage-earner was a distinction, and the owner was looked upon as a more than prosperous fellow. A decade or so farther back there were few people, not of independent income, who thought it seemly to appear with gold watches. Silver watches in those days were considered quite good enough for all practical purposes, and one didn't see a gold watch on the person of a wage-worker very often. Gradually, however, the gold watch became more frequent, and the silver watch wasn't so satisfactory as it had been. Then in a few years the gold watch grew almost common, until I can remember how a few years ago the silver watch was as uncommon as the gold watch had been ten years previously. Then it became so that if a man had a watch at all it was gold nearly always, and gold grew cheap. In the last few years a change of taste is becoming apparent. The gold watch is giving way, very slowly, to the silver watch, and one sees silver watches very often where they were really uncommon. And in jewelry of whatever kind silver is coming steadily in demand.—*The Jeweler's Review.*

A PROFESSIONAL CLOCK-WINDER.—Did you ever hear of a professional clock-winder? Well there is such a thing, and right in Boston. In the winter time his business is brisk, as at that season of the year almost all his customers keep open house. He remembers among his patrons many of the residents of the Back Bay district, most of them whom keep two or more clocks in their houses. Mr. Clock-winder goes about making his calls each day or week, as the case may require, attending to his subjects in such a way that no one is given false time or suffers on account of forgetting to wind his clock. The clock-winder's method is to examine each clock, wind it, set it, and if it is out of order or needs cleaning sees that it is put to rights. He keeps a record of each clock, when it was set last and the days for winding; in short, his book is a complete history of the good or evil doing of the clocks in his care. One thing he never forgets, and that is to send in his little bill each month. He has a large number of customers: and is adding several each week. The price he exacts is but a trifle. *Boston News.*

WATCH MAKING IN FRANCE.—It appears from a report made by the Besancon Chamber of Commerce on the operations of the French watch industry, that the anticipations formed in 1889, of an improving course of business were fully realized in 1890. Out of 404,436 watches of French manufacture delivered for consumption in 1890—of which about 30 per cent were gold and 70 per cent silver—no fewer than 401,439 were passed by the Besancon Control Office. Foreign watches to the number of 40,911 were passed, of which 8515 were gold and 32,396 silver. A comparison of the French watches with the foreign article shows that Besancon supplied 90.70 per cent of the general consumption in 1890, against 89.51 per cent in 1889, and 85.45 per cent in 1888.—*London Times.*

A RAILROAD ENGINEER'S CLOCK.—A new clock has been invented by a railroad engineer that promises to be a great advantage to locomotive engineers. The dial-plate and figures are large, and so are the hour and minute hands. As a train whirls by a station the hour and minute hands whirl round like a flash to mark the correct time, and a red bull's-eye flashes into the dial. Five minutes later the red light turns green, and in five minutes more the green light disappears. The engineer on the next train following can tell exactly how many minutes ahead is the train that precedes him. The clock is a perfect time-keeper, and when the train passes drops the signal light.

A MAMMOTH CLOCK.—A clock that might be safely stated to be the eighth wonder of the world is to be placed on the tower of a public building now erecting in Philadelphia. The center of the dial, which is 25 feet in diameter, is to be 35 feet above the street. The bell will weigh from 20,000 to 25,000 pounds, and its detonations will be distinguishable throughout the whole city. The minute and hour hands are to be 12 and 9 feet in length, respectively, and the Roman characters on the dial will be two feet eight inches long.

AN AMERICAN WATCHMAKER HAS JUST HIT UPON a contrivance by which, a couple of hours before a clock runs down, the words "Please wind me up" will appear at an opening in the dial.

A WATCH MANUFACTURER, OF LIVERPOOL, has invented a lever watch that only requires winding once every eight days.

TIDE POWER.—The French have planned work at Havre for utilizing the ebb and flow of the tide to work turbine wheels to generate power for the dynamo to supply Paris with light.

ENGINEERING NOTES.

AN IRON RAILWAY BRIDGE FOR PERU.—An immense iron bridge 575 feet long is now being constructed over a chasm 250 feet deep, with but two piers, one 122 feet and the other 142 feet high, resting on the banks of the river chasm 100 feet above the bed of the river. This bridge is to take the place of a structure erected in 1872, having its piers in the center of the chasm, and which was washed away by a "cloudburst" which phenomena are common in that neighborhood. The present bridge is being built by the New Jersey Iron & Steel Co. There is something significant, remarks a contemporary, in the fact that American engineers have, during ten years past, secured a good many contracts for constructing iron bridges abroad. It has been because of skill, as the material in many cases, has been purchased in other countries.

THAT GREAT ENGINEERING WORK, the Corinth Canal, which will sever the Peloponnese from the mainland of Greece, and will permit the largest ships to pass directly from the Gulf of Athens to the Gulf of Corinth, is said to be rapidly approaching completion. The canal will have no locks, but is level from end to end and perfectly straight, the width being 96 feet and the depth 36. At the Corinth end it is crossed by a railroad bridge 164 feet high, under which the tallest ships may pass without lowering their topmasts. It is assumed that about 300 vessels from Trieste and Finme, and about the same number from Italian ports, will pass through the canal annually, while it is calculated that between 700 and 800 Greek ships will use the canal—a total, say, of more than 1200 vessels annually, averaging 1500 tons each.

THE MAIL SUBSIDY.—It is estimated by some of New York's large shipping houses that the new law for subsidizing U. S. mail steamers will result in the early construction of some 30 first-class American ocean steamships. English steamship owners, however, expect to make light of the matter, and think the law will be powerless to interfere much with the present system of carrying American mails in English ships. Time will show which is correct.

THE LONGEST BRIDGE in the world is the Lion bridge in Sangang, in China. It extends 5½ miles over an area of the Yellow Sea and is supported by 300 huge stone arches. The roadway is 70 feet above the water and is enclosed in an iron network. A marble lion 21 feet long rests on the crown of every pillar. The bridge was built at the command of the Emperor Kien Long, who abdicated in 1796 on account of old age.

THE HUDSON RIVER TUNNEL.—The great tunnel under the Hudson river between New York city and Jersey City is rapidly nearing completion. The company has notified the various trunk lines terminating in Jersey City that it will be in a position to furnish transportation through the tunnel shortly. The company declares that it will have the first single track in running order in three months.

A NOVEL CONSTRUCTION.—A "locomotive steamboat" is being built at Kristanstad, Sweden, for the navigation of a chain of small lakes, separated by falls. The boat is to be fitted with wheels fitting a track, and power can be applied to either the propeller or the driving-wheels of the locomotive part of the craft. The track is three feet, six inches gauge, with grades of one in 33, and curves of a radius of 100 metres.

THEN AND NOW.—Many years ago an ocean steamship made only 10 or 12 revolutions of the engine, using only five pounds of steam pressure. With this she averaged about eight knots. High-powered ships of the present day use 36 times this pressure and make seven times the revolutions. Their speed is only 2½ times as great.

THE DEMAND FOR SPEED.—Austin Corbin recently said: "If I could buy steamships that would make a trip to Europe inside of four days, they'd be cheap at \$3,000,000 apiece. I'd order them to-morrow. I could literally charge what I pleased for passage and run full all the time. People will pay well to travel fast."

THE FASTEST STEAM CRAFT probably in the world is the steam launch Norwood of New York, which has made a record of 26.28 statute miles. It may be mentioned, however, that a speed of 27.4 knots has been claimed for a European torpedo boat. Such speed, if made, was probably on a spirit of a few minutes.

A NOVEL DEVICE.—An English inventor has constructed a novel device to do away with the enormous pressure of water against the bows of ocean steamers. It consists of one or more screws on each side of the bow, which throws the water aside and creates a dry well in front of the vessel.

THE LARGEST SHIP CANAL in Europe is the great North Holland Canal, from Amsterdam to Helder, five miles; completed in 1825; 125 feet wide at water surface; 31 feet wide at bottom; depth 20 feet.

USEFUL INFORMATION.

TO MAKE GOOD COFFEE.—"It is quite astonishing that so few persons really know how to make a good cup of coffee," said the master of the house, making a wry face over the thick, muggy fluid which the new cook had served for breakfast. "And it is so simple," he continued, "any one could make it. When I was a bachelor and lived in rooms, I always made my own coffee and I never failed. Here is my formula, if you like to have it for your new cook, who, I must say, needs a hint or two. It is better, of course, to grind your own coffee, as then you are sure of having it good, but I never cared to take the trouble or the time myself. Put the ground coffee in the coffee pot, the quantity being regulated according to the number of persons; a family of six would require about a teaspoonful. Add half a pint of cold water and one raw egg, but do not put in the shells, as many ignorant cooks do, considering that the broken bits have a peculiarly clarifying power. Stir all well together, add one quart boiling water, and let the whole boil for 15 minutes. While still boiling, pour in half a cup of cold water, and put the coffee pot on the side of the stove where it will not boil, and let it stand for several minutes. Coffee made in this manner will be found clear, strong and free from 'gronds.'—*New York Tribune.*

LAUNDRY WORK.—One of the most troublesome things, especially for the woman who hoards, is to find a laundress who will do her work properly. Fine undergarments do not require to be rubbed heavily. They are best rubbed through the hands, rather than on the board. It is exceedingly difficult to get the ordinary laundress to understand how to wash such garments. The unskilled hands may tear holes in the sheer lawn and ruin the garment in the first washing. Above all things the laundress should be cautioned against the use of starch in all garments except in a petticoat. Some laundresses have a fatal fancy for the use of starch in all kinds of underwear. Never allow a laundress to wring garments by hand. The wringer does the work with less wear and tear than any hand-wringing. Where silk underwear is worn, it should be washed quickly and rapidly, with some kind of white soap, in warm water, thoroughly rinsed, wrung as dry as possible, and pressed out before it is thoroughly dry. Flannels should be washed in exactly the same way, except that care should be taken to keep the water at the same temperature as the room.—*Good Housekeeping.*

VALUE IN COAL TAR.—It would appear, says the *London Mining Journal*, that the valuable materials obtained from coal tar are almost inexhaustible, for new discoveries of value for various purposes from the slightly product of distilled coal are being constantly brought to light; but the latest addition to the many products obtained from the tar is an article having all the properties of India rubber. It is stated that, after the tar has been refined by means of sulphuric acid, a German chemist has discovered a method by which the residuum can be worked up by simple manipulation into a black mass bearing in appearance a very close resemblance to ordinary asphalt, but at the same time having all the elastic properties of India rubber. By being submitted to continuous and intense heat, it is stated that the material can be decreased in bulk some 50 or 60 per cent, when it becomes very hard indeed, but at the same time very elastic. In the original or soft state the material is termed "mineral rubber asphalt," but when it is dissolved in naphtha it becomes a fine waterproof varnish, suitable for similar purposes to which ordinary varnish is made to form a durable and reliable waterproof for most textile substances especially.

IN BUYING ROPE AND TWINE, great care has to be taken as to the purity of the material. They mix up, for instance, manilla with a cheaper material called "New Zealand." The same is done in the manufacture of twine, where, instead of the pure hemp and flax, they mix in jute and similar stuffs, and can, of course, give such products cheaper; therefore, be careful what you are getting for your money.

LIBRARIES.—The United States leads the world in the number and extent of its libraries. The public libraries of all Europe put together contain about 21,000,000 volumes; those of this country about 50,000,000.

A NEW MATERIAL FOR BELTS.—A peculiar glossy and semi-transparent cloth is said to be made from the fiber of nettle, which is used, among other things, for machine belting. It is claimed to have double the strength of leather.

NEGRO INVENTORS.—A volume is to be published on the negro inventors of the United States during the past 100 years. It is alleged that our dark brother will show a most favorable record.

BRICKS are enameled by being dipped into a slip composed of finely ground enamel suspended in water. They are then dried and fired a second time.

JAPAN has 2000 newspapers. Not a single journal existed there 25 years ago.

Passing Events.

Neither the Nevada nor the Utah mining excitement at Pine Nut or La Plata seems to be as well sustained as first reports would lead one to believe. Still there has been no time for any development of much extent, and some very good mines may be found and opened.

Some little attention is being turned to the operations of the "rain-makers" just now, and the apparent success of Melbourne leads many to doubt the assertion of scientists that the idea is impracticable. The subject is discussed at length in another column.

The change in management at the Temescal tin mines is somewhat of a surprise to the public, but as the new manager is an expert tin miner from Cornwall, and is turning his attention exclusively to the mine itself, the actual value of the mining property will soon be proven.

The Allison Ranch mine at Grass Valley does not seem to have been hoaxed after all, but it is likely that the negotiations pending will result in the mine being again worked in the near future.

Temescal Tin Mines.

The affairs of the San Jacinto Estate (Limited) do not appear to be running harmoniously for some reason. The Temescal tin mines are being worked after a fashion, but the fashion does not seem to suit the English owners of the property, for Manager Robinson has been deposed, or has suddenly resigned, and a Cornish tin miner named J. Harris is in charge.

Col. Robinson was called to London to report, and the day after his arrival, Mr. Harris, who was at the mines, was notified that Col. Robinson was no longer connected with the company's affairs. Mr. Harris stopped all work in connection with the dam and proposed water supply, the farming operations, and everything else except the mine itself. In the *New Era*, there recently appeared an article, presumably by J. H. Crossman, in which he described the various improvements inaugurated by Col. Robinson. Among these was a dam to restrain the waters of the Temescal river, to be used for reclamation and irrigation purposes.

A considerable area of agricultural land was cleared and cultivated, fruit trees and shrubbery planted, the estate surveyed and platted, and a plan formulated for "farm letting" of small holdings on the estate. Col. Robinson also leased the Gavilan series of gold mines on a royalty of 20 per cent of gross proceeds. Meantime he also worked the tin mines, opening them systematically and producing some tin—not by any means as much as is generally supposed, but enough to make a showing of metal, and enough to place a small quantity on the market, one shipment being sent East.

The Colonel was then ordered to England, and Messrs. H. Stephens, purser, and J. Harris, superintendent, were sent out as temporary managers during his absence. The *Era* correspondent says these gentlemen "have made radical changes in the management of the estate during their short stay, and are pursuing a narrow gauge policy that cannot but be detrimental to the true interests of the company. They have entirely ignored the Colonel's (the former manager) plans for the development of this vast property. They are building a large mill at the mine without any possibility of getting water to run it, stopped work on the dam and lower mill, and as far as possible moved or sold the machinery—in fact, suspended all work that is not directly connected with the Cajaleco tin mine, while there are 28 others that are believed to be equally as good."

It seems the London directors were dissatisfied with the conduct of affairs, and sent their own man out to take charge. When this has been done by English companies owning gold and silver mines, it has usually been disastrous to them; but in the case of tin, where the Cornish have experience and we have none, they ought to be able to make a success, if any one can. The experimental mill is still running, and more extensive machinery will soon be at work.

It is to be regretted that there should be any friction in the management of this, the only tin mine actively at work in the United States. There are said to be plenty of orders for the tin, which the company cannot as yet supply. Whether the mine will really do all that has been promised for it remains to be seen. With an experienced Cornish tin-miner in charge, the English owners will doubtless be better satisfied that their property is being worked in the way they are accustomed to. But the San Bernardino county people do not like the idea of seeing the extensive plans proposed so suddenly abandoned.

As to the Gavilan gold mines, the manager, Mr. W. C. Westbrook, has gone to Chicago to arrange for machinery, etc. Why he did not arrange for it in San Francisco is not explained. We know something about gold mining machinery here, as Mr. Crossman might have told him.

THREE gold bricks from Cedros Island mine were received at a San Diego bank a few days ago. They weigh 2173 ounces and are valued at \$35,000. This is said to have been a ten days' cleanup at the National City Reduction Works.

THERE is talk of a scheme to build an electric railway to the summit of Mt. Wilson from Pasadena, the dynamos to be run by water-power.

Asbestos.

In the census year, 1889, the only asbestos mined in the United States came from California, amounting to 30 tons, valued at \$1800. In the same year there was imported into this country asbestos to the value of \$263,393. The production of asbestos in the United States has shown an annual decrease since 1882. The product for 1882 was 1200 short tons; in 1883, 1000 short tons; 1884, 1000 short tons. The product for 1885 showed a decided drop, being only 300 short tons, and this was again reduced to 200 short tons in 1886 and 150 short tons in 1887. In 1888 the product was 100 short tons, valued at \$1800.

Asbestos is found in the United States in a comparatively narrow belt of metamorphic rocks extending along the Piedmont region, or Eastern slope of the Appalachian mountains, from New York through Pennsylvania, Maryland, Virginia, North and South Carolina into Georgia. It is inferior in quality to the best mined in Italy and Canada. Its fibers are comparatively short and somewhat spindle-shaped, with occasional crust-fractures, which not only render it brittle but diminish its tensile strength. Asbestos is also found in considerable quantities in Wyoming and California, but the fiber is not strong. Lately it has been found in quantity in Oregon; but so far the entire product of the United States is from California, according to the late census bulletin.

The fibrous material known to the trade under the name of asbestos comprises at least two distinct species of minerals, one of which, a variety of hornblende, is properly called asbestos; the other is chrysotile, a variety of serpentine, and may be readily distinguished from asbestos by yielding water when heated in a closed tube. Both asbestos and chrysotile are found in regions of altered crystalline rocks, and yet each has its own particular assemblages. The former occurs with metamorphic rocks rich in hornblende, while the latter is found in distinct veins penetrating masses of serpentine, which have resulted generally from the alteration of eruptive rocks, rich in olivine. It is customary, however, in trade circles to include both varieties under the name of asbestos.

Asbestos is used in the manufacture of fire-proof paints, roofing, piston packing, felt packing, fire-proof cements, sheet and roll mill boards, flooring, and for the covering of steam pipes and boilers. It is largely used in lining for fire-proof safes, and is also made into yarn, cloth and paper. Non-consuming lampwicks and fire-proof drop curtains for theaters are now being made of this material. Some demand has also been created for its use in the manufacture of insulators for electric wires.

The fiber of the California and American asbestos generally, is more brittle and harsh than the imported, and is not so well adapted to the manufacture of spun and woven goods. It will stand, however, a greater degree of heat than the Canadian or foreign material, and is more suitable for the manufacture of fire-proof cement and paint, for which length of fiber is not essential. If the conditions were such that the mineral could be economically mined in this country, it is probable a considerable amount of capital would be invested in the industry. An examination of the specimens at the State Mining Bureau in this city shows that the mineral is found in many of the counties of this State, though it is actually mined at but few localities. It is found also in several places in Nevada and Arizona. The market here seems to be limited, and only the best quality is salable. The imports of crude asbestos are steadily increasing, the amount for 1889 being greatly in excess of any previous years, being about 51 per cent over imports for 1888, 81 per cent over 1887, and 89 per cent over 1886, exceeding the entire imports from 1869 to 1885 inclusive. This shows a steadily increasing demand by which owners of asbestos mines here should be benefited. Yet the American production shows a steady decrease, notwithstanding the increase of demand.

AN ENTOMOLOGIST'S CATCH.—G. W. Dunn, a well-known naturalist, has returned to this city with over 82,000 entomological specimens from Lower California and Sonora. Of these, over 70,000 are coleoptera, 5000 orthoptera, comprising grasshoppers and crickets, and 4000 hnterflies. Over 100 of these insects are new,

Two Mining Booms.

The news from the Utah and Nevada mining "booms" does not appear to be very encouraging after all. The Zinn mine, at Pine Nut, has been talked about as one of wonderful richness. Governor Colcord of Nevada, who has himself prospected in that region, says the reports are from men who have more enthusiasm than knowledge of mining. He did not want to see a lot of men rush to the district and be disappointed. Governor Colcord gave his reasons in detail for not believing that there was anything very promising at Pine Nut. As a man who had been a practical miner and prospector the best part of his life, and who had worked in and been connected with mines almost to the day he took office, he said he felt confident that he understood the business very well. The trouble with Pine Nut was that practically nobody vouched for it but Zinn, an ignorant miner. Zinn had a partner, a half-owner in the mine, one Schultz, who had not yet said that he believed there was a big mine in sight. Until Schultz said something, every good mining man who knew him would be doubtful about the real value of the strike. The Governor declared that Schultz, a butcher in Carson, was an honest man, and that if anybody could get him to say that the rumors about Pine Nut were true, it would be time enough to believe them. Schultz has been giving Zinn a "grub stake" for years, and now that the latter had a strike, Schultz would not, or at least had not said whether this was a good one or not. This, in the opinion of the speaker, was a suspicious circumstance and might well be taken into consideration by men contemplating a trip to Pine Nut.

The one fact, though, that, in the belief of Nevada's Governor ought to deter men from rushing to Pine Nut, is that all the claims for a distance around have already been taken up, and there is nothing left for anybody who has not plenty of money.

As to the La Plata mines, near Ogden, Utah, some details are given in our "Mining Summary," on another page. The man who writes the facts is a miner, and while he believes the district will be a good one, he does not think it of great extent or wonderful richness. A Montana paper has also interviewed Gregory N. Lyons, who has just returned from La Plata. He is not at all impressed. He says: "Arriving in camp, we looked in vain for the two-story hotel that had been pictured in such glowing terms by the Ogden papers. A tent was the only excuse we could find. The same was true of the reduction works, and all other great industries told about with all the flower of rhetoric and all the skill of a professional liar. In short, two insignificant prospect holes represented all the mines in the district, and a number of claims, with a few scattered tents and a lot of disgruntled prospectors, made up the boom. To be sure, they had found some rock there that would run way up in lead, but it was only at the bottom of a six-foot shaft, and no one could tell what the outcome would be. There was no more excuse for a boom than there would be for me to go out on the hill here and try to get up an excitement over any old deserted prospect hole, not so much, since every one who goes in there must pay out a lot of money and lose his time for nothing."

MINE SURVEY.—Mr. Bagget, attorney for the West Consolidated Virginia and California Mining Co., filed in the District Court at Virginia, Saturday, an application for a survey of the underground workings of the Consolidated California and Virginia to ascertain if the latter company is or has extracted ore from the West Consolidated Virginia and California's ground. Both locations are included in the same patent, the West Consolidated Virginia and California Co. deriving title by a deed from the Consolidated California and Virginia Co. The contest will definitely settle the question whether all the ledges in Storey county are included in the main Comstock lode.

A MINERAL EXHIBIT.—The State Mineralogist has been requested by the trustees of the State Mining Bureau to collect and collect as complete a collection as possible of the ores and minerals of California for an exhibit at the World's Fair. All miners of the State and others interested in the development of the mineral resources of the State have also been requested to contribute to the collection.

The McIntosh & Seymour Engines.

(Continued from page 145.)

will be seen from the cut, is a horizontal tandem compound engine, with high pressure cylinder and receiver steam jackets. This is considered the most economical type, with as high pressures as can be ordinarily carried. The chief peculiarity of this engine is the position of the high pressure valve together with its actuating gear upon one side of the engine and that of the low pressure upon the opposite side. This allows each valve to be driven in the most direct and simple manner, separately and makes easily accessible the moving parts, and is the only arrangement

brisk circulation through all the jackets, which is so essential to their efficiency. The water condensed is returned to the boiler.

The low-pressure valve is moved by a fixed eccentric and the high-pressure valve by the governor or automatic cut-off regulator. This and also the valves, frame, solid steel shaft and moving parts generally, are precisely similar to those of the Standard high-pressure engine. The simple, perfectly balanced piston valves are prevented from leaking by adjustable seats, the efficiency of which has been fully proven in actual service. The governor commands itself for its simplicity, durability and power. Without any tendency to over-sensitiveness, it will regulate the speed of the engine within

The Drumlummon Mine.

The Drumhomon mine, Lewis and Clarke county, Montana, is owned by the Mootana Co., Limited, an English organization. The mine is a wonderful producer, and has paid big dividends. It has three mills aggregating 120 stamps. The ore is not of a very high grade, but there is plenty of it. The longitudinal section of the mine signed in the accompanying cut shows the developments up to the end of the year. It will be seen that an immense amount of development work has been done. The reserves of both high and low grade ore are quite extensive. Very systematic work is carried on in this mine, gangs of men being

Tajo mine, which will soon be shipped. This type is getting to be a favorite for mining and electric lighting purposes, by reason of the small space they take up.

In marine work, two twin engines are being made for a coasting schooner. These are compound, 12 and 24 by 20 inches. Quite an extensive repair job has just been completed on the Salvadorian Government vessel Coscatlan. The machinery was overhauled; new decks put in, and the vessel generally remodeled. The work has all been done, and the vessel is ready for sea.

The works have started in on the new quarantine boat, and have the contract for the boat complete with machinery. She is to be of

LONGITUDINAL SECTION OF THE DRUMLUMMON MINE, LEWIS & CLARKE COUNTY, MONTANA.

possible with a tandem engine which avoids a very complicated and unsatisfactory valve driving gear. Hence this arrangement, which is patented, is a very valuable feature in a high-speed compound engine for electric-lighting purposes.

Since the low-pressure cylinder exhausts into a vacuum, it is impossible to "onshion" satisfactorily, on this side of any form of double compound engine. This prevents smooth running and renders necessary frequent adjustment and attention. Since both pistons are on the same rod, this difficulty is avoided in the tandem engine, and the compression obtained in the high-pressure cylinder gives remarkable smoothness and quietness to the running of the engine.

Live steam, after passing through the jackets of the high-pressure cylinder, is used to jacket the receiver. The lower temperature of the steam in the latter causes considerable condensation in its jacket, and this induces the

one per cent for all changes of load and pressure from zero to full load.

Like the high-pressure engine, the compound is of the double-crank class, with two overhanging wheels, and when desired is provided with a foundation box extended under the cylinders, as shown on the second and third pages following, making it entirely self-contained. The workmanship and materials used throughout are simply the very best that can be obtained, and each engine is subjected to a most exhaustive test before leaving the shops. The agents of these engines in this city are Rix & Birrell, 38-44 Fremont St.

It is stated that the San Jose Watch Factory at Alviso will be in running order by October 1st. The building is about completed.

GOLD is beginning to flow back to this country from Europe, after having been moving in the opposite direction for some months.

kept prospecting, while others are removing ore. The lode is a very large one. The mine is one of the famous ones of Montana.

Foundry Notes.

At the Fulton Iron Works, they are just completing an 18x42 Corliss engine for the Haywards Electric Light Co., which is to take the place of smaller engines previously in use. New shafting, pulleys, etc., go with the plant. A lot of shafting and pulleys are also being made for the California Electric Light Co. and the Vallejo Electric Light Co.

There is not much going on in the mining machinery line, though some small orders are being filled for Mexico. A 16x36 Myers cut-off engine is being built for a mine in that country, and with the same order go a number of pans and settlers. A 10-stamp mill, for the same region, is also being constructed. They are building a compound, vertical engine for the

composite construction—iron frame and wooden sheathing. The compound engines will be 10 and 20 by 12. The boat is to be about 85 feet long and 16 feet beam.

A Corliss engine, 14x30, has just been completed for the Contra Costa Laundry Co., of Oakland, which is to drive all the machinery of the laundry.

GOVERNMENT MAPS—The Government has five parties of surveyors now at work in California, and Prof. S. H. Thompson of the U. S. Geological Survey says they will remain in the field as long as the weather will let them. A map of the Grass Valley gold region, on a scale of one inch to 1200 feet, is being made especially for the benefit of miners. The parties in the southern part of the State are working particularly for the farmers, locating arable land well belted and making maps which will prove useful to those contemplating the construction of irrigation systems.

Two New Books on Steam Engineering.
By Emory Edwards.

JUST READY.

The American Marine Engineer.

Theoretical and Practical, with Examples of the Latest and Most Approved Marine Practice. For the Use of Marine Engineers and Students. By EMORY EDWARDS, Marine Engineer. Illustrated by 55 engravings. 12mo. 435 pages. Price.....\$9.50
By mail free of postage to any address in the world.

CONTENTS.

Introduction. Chapter I. The Theory of the Steam Engine. II. Expansion of Steam. III. The Efficiency of Steam Engines. IV. Triple Expansion Marine Engines. V. Cylinder Ratios of Triple Expansion Engines. VI. Calculation of Work Done in a Compound Engine. VII. To find the Horse Power of Simple, Compound and Triple Expansion Engines. VIII. To find the Mean Pressure. IX. Slide Valve. X. Proportioning Ports and Slide Valves. XI. Link Motion Valve Gear. XII. Valve Motion Diagram. XIII. How to Set Slide Valve. XIV. Engine Construction Details. XV. United States Government General Rules and Regulations for Steam (Marine) Boilers. XVI. Burning of Fuel. XVII. Forms of Steam Boilers. XVIII. Modern Marine Boilers. XIX. Riveted Seams. XX. Forced Draft. XXI. Water Tube Marine Boilers. XXII. Repairs at Sea, and How to Make Them. XXIII. Taking Care of an Engine. XXIV. Valuable Information. XXV. Steam Tachis and Launches. XXVI. Modern American Marine Engines and Boilers. XXVII. Modern Steam Engineering, U. S. Navy. XXVIII. Triple Expansion Screw Engines and Boilers of the U. S. S. Philadelphia. XXIX. Examples of Recent Engines. XXX. Triple Expansion Engines, S. S. Columbia. XXXI. Compound Marine Engines. Appendix. Index.

An illustrated circular of 6 pages, quarto, giving the full table of contents, with specimens of the engravings of this valuable book, will be sent free of postage to any one in any part of the world who will send us his address.

ALSO,

EDWARDS'

600 EXAMINATION QUESTIONS AND ANSWERS.

FOR ENGINEERS AND FIREMEN

(Stationary and Marine) who desire to obtain a U. S. Government or State License. By EMORY EDWARDS. Full bound in pocket book form, leather. 130 pages. Price.....\$1.50
By mail free of postage to any address in the world.

Our New Revised Descriptive Catalogue of Practical and Scientific Books, 88 pages, 6vo, and our Catalogue of Books on Steam and the Steam Engine, Mechanics, Machinery, and Dynamical Engineering, and other Catalogues, the whole covering every branch of Science applied to the Arts, sent free of postage to any one in any part of the world who will furnish his address.

HENRY CAREY BAIRD & CO.,

INDUSTRIAL PUBLISHERS, BOOKSELLERS & IMPORTERS,
810 Walnut St., Philadelphia, Pa., U. S. A.

Giant Powder Fuse Cap Fastener.

The instrument represented in the above cut is a new and little known invention, being designed to save life and limb, and innumerable lawsuits, by doing away with the dangerous operation of digging out wet and exploded loads where Giant Powder is used in mines. The little instrument crimps the cap on to the end of the fuse firmly and absolutely water-tight. It is also used for cutting the fuse. They are usually gotten-up of the finest cast steel, nickel plated. Price, \$2 each, or the entire instrument finished in gold plate, \$3. N. W. MOODY, Fresno, Cal.

QUARTZ SCREENS

A specialty. Round, slot or hurred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished iron

HERCULES GAS OR GASOLINE ENGINE

FOR POWER OR PUMPING PURPOSES.

The Lowest Priced Reliable Gas Engine on the Market.

SEND FOR ILLUSTRATED CATALOGUE AND PRICE LIST.

For Simplicity It Beats the World. It has Fewer Parts, and is therefore Less Likely to get Out of Order than any other Gas Engine now built.

IT OILS ITSELF FROM A RESERVOIR. JUST LIGHT THE BURNER, TURN THE WHEEL, AND IT RUNS ALL DAY.

No Carburetor to get out of order. No Batteries or Electric Spark to care for. Always Ready, and a Boy can start it at once. No Double or False Explosions, which are frequent with the Unreliable Spark.

IT RUNS WITH A CHEAPER GRADE OF GASOLINE THAN ANY OTHER ENGINE, AND CONSEQUENTLY IT COSTS LESS TO RUN IT.

PALMER & REY, Manufacturers,
405 Sansome Street, San Francisco, Cal.

ELECTRIC BLASTING.

VICTOR ELECTRIC PLATINUM FUSES.
Superior to all others for exploding any make of dynamite or blasting powder. Each fuse folded separately and packed in neat paper boxes of 50 each. All tested and warranted. Single and double strength, with any length of wires.

VICTOR BLASTING MACHINE.—Made in two sizes. No. 2 fires 20 to 30 holes. No. 1 fires 5 to 8 holes. Adapted for prospecting, stump blasting, quarry and general railroad work.

"PULL UP" BLASTING MACHINE.—The strongest and most powerful machine ever made for Electric Blasting. No. 4 size fires 70 holes. No. 3 size fires 40 holes. Are especially adapted for submarine blasting and large mining work.

Standard Electric Fuse and Blast Tester, Wire Reels, new design, Leading and Connecting Wire.

THOMSON-HOUSTON ELECTRIC CO.,

15 FIRST STREET, SAN FRANCISCO.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Concentrating Belt manufactured in San Francisco; we can therefore fill all orders on short notice. The length and width of these belts are the same as is used on the Frue or Triumph Concentrating Machines, but can be made of any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen. First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight rifflings also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or any other ore crushing machines now before the public.

Send for Circulars and Price List.

MARSHUTZ & CANTRELL.

FRUE ORE CONCENTRATOR

OVER 3000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

PROTECTED BY PATENTS—September 2, 1879, April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

Price of Plain Belt Frue Vanner, \$575, f. o. b.

Price of Improved Belt Frue Vanner, \$825, f. o. b.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frue" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - \$650 f. o. b.

Price "Triumph" Concentrators, with Plain Belt - - - - - \$550 f. o. b.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company, Principal Office, 401 California St., cor. Sansome, S. F. Location of Works, Orass Valley, Nevada Co., Cal. ORASS VALLEY, NEVADA CO., CAL., Nov. 10, 1886.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.: GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices.

[Signed] Sup't North Star and Original Empire Mining Co. N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

JOSHUA HENDY MACHINE WORKS,

39 to 51 Fremont Street, San Francisco, Cal.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin it used be. Circulars and testimonial letters furnished on application.

HYDRO-CARBON ASSAY FURNACES

IMPORTANT TO GOLD MINERS! SILVER-PLATED AMALGAM PLATES for SAVING GOLD In Quartz, Gravel and Placer Mining.

PRICES GREATLY REDUCED. ONLY REFINED SILVER AND BEST COPPER USED. OVER 3000 ORDERS FILLED. FIFTEEN MEDALS AWARDED. Old Mining Plates can be Replated. Old Plates Bought, or Gold Separated. These Plates can also be purchased of JOHN TAYLOR & CO., Corner First and Mission Streets, San Francisco.

SAN FRANCISCO GOLD, SILVER AND NICKEL PLATING WORKS,

H. G. DENNISTON, Proprietor.

653 & 655 MISSION ST., SAN FRANCISCO, CAL.

Our Plates have been used for 20 years. They have proved the best. We adhere strictly to contract in weight of Silver and Copper.

SEND FOR CIRCULAR.

RECEIVED EVERY MEDAL Awarded on the Pacific Coast for Silver-Plated Amalgam Plates and Best Gold, Silver and Nickel Plating.

Adamantine Shoes and Dies —AND— CHROME CAST STEEL

Cams, Tappets, Bosses, Roll Shells and Crusher Plates,

THESE CASTINGS ARE EXTENSIVELY USED IN ALL THE MINING STATES and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to above conditions. When ordering send sketch with exact dimensions. Send for Illustrated Circular.

Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.

H. D. MORRIS, Agent, 224 Fremont St., San Francisco.

Special attention given to the purchase of Mine and Mill Supplies.

Stamp Cam.

PAT. OCT. 25, 1881.

PERFECT PULLEYS

First Premium Awarded at Mechanics' Fair, 1884. CLOT & MEISE,

Sole Licensed Manufacturers of the

MEDART PATENT WROUGHT RIM PULLEY

For the States of California, Oregon and Nevada, and the Territories of Idaho, Washington, Montana, Wyoming, Utah and Arizona. Lightest, Strongest, Cheapest and Best Balanced Pulley in the World. Also Manufacturers of

SHAFTING, HANGERS AND APPURTENANCES.

SEND FOR CIRCULARS AND PRIOR LIST.

Nos. 129 and 131 FREMONT STREET,

SAN FRANCISCO, CAL.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 1300 IN USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

THE PELTON WATER WHEEL CO.

121-123 MAIN STREET, SAN FRANCISCO, CAL., U. S. A.

PELTON WATER MOTORS. Varying from the fraction of 1 up to 15 and 20-horse power, unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. Address as above.

THE GATES ORE AND ROCK BREAKER.

UNLIMITED IN CAPACITY. UNEQUALED IN EFFICIENCY, UPWARD OF 3,000 NOW IN USE. Will do more than twice the work of any other with the same cost in wear. Gives a fineness of product that increases the capacity of any mill from 25 to 40 per cent without any additional expense. THE BEST AND ONLY CRUSHER ADAPTED TO MACADAM ROAD WORK. Send for Circular.

It having come to the notice of the undersigned that their patent rights are being infringed upon, intending purchasers are hereby warned that all such infringements will be duly prosecuted. (Signed) THE PELTON WATER WHEEL CO.

THE PELTON WATER WHEEL CO., 121-123 Main Street, San Francisco, General Western Agents.

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

THE BEST FORM OF FEEDER EVER DEvised,

And pronounced by reputable mining men to be far superior to any other, as the fact that over 3000 have been placed in successful operation fully demonstrates.

WE ARE ALSO MANUFACTURERS OF THE

"STANFORD," "TULLOCK" AND "ROLLER" FEEDERS,

And will furnish descriptive Catalogues and quote prices upon application.

ALEX. HEINS

(Successor to Heins & William),

Manufacturer of Leather and Fuled Rawhide

BELTING,

ROPE, LACE AND PUMP LEATHER,

ETC., ETC.

134 MAIN ST., SAN FRANCISCO, CAL.

FOR SALE.

THE MINERS' HOTEL. SIERRA CITY, Sierra County, Cal. This Hotel has the trade of the Miners. The general standing of the mines in this well known quartz-mining section makes this hotel a first-class investment. For further particulars, address

J. ROSE, Sierra City, Cal.

RUPTURE AND PILES.

We POSITIVELY CURE all kinds of Rupture and Rectal Diseases, no matter of how long standing, in from 30 to 60 days, without the use of KNIFE, DRAWING BLOOD, or DETENTION FROM BUSINESS. Terms: No Cure, No Pay; and no Pay until Cured. If afflicted, come and see us or send stamp for pamphlet. Address:

DRS. PORTERFIELD & LOSEY,

888 Market Street - San Francisco.

ELECTRICAL ENGINEERING CO.,

— MANUFACTURER OF —

Dynamos and Electric Motors

FOR THE TRANSMISSION AND DISTRIBUTION OF POWER.

Manufacturer of and Contractor for the Installation of all Kinds of

ELECTRIC APPARATUS.

The Dynamos and Motors manufactured by this Company develop the highest mechanical efficiency; they require little or no attention, are almost noiseless, and run with an entire absence of sparks at the brushes, rendering the daily trimming of brushes unnecessary.

Electric Power Apparatus for Quartz Mills, Hoisting, Pumping, Drilling, and all Mining Work, where Long Distance Transmission is desired, a Specialty.

Office and Works, 21 & 23 SPEAR ST., San Francisco, Cal., U. S. A.

IMPROVED FORM OF HYDRAULIC GIANTS.

THE ABOVE CUT ILLUSTRATES THE IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture, and which are pronounced far superior to the SINGLE-JOINTED style. The latter, however, we furnish when requested. Prices, discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent upon application.

JOSHUA HENDY MACHINE WORKS, 39 to 51 Fremont St., San Francisco.

The Pollok Gold-Extracting Process.

The special feature of the Pollok chlorination process is the method in which the chlorine is applied—a so-called hydraulic chlorination method, i. e., the chlorine, after being liberated, is liquefied by hydraulic pressure. The ore is first crushed and passed through a 30-mesh screen, too great fineness not being desirable. "Float gold" ores are brought at once to the chlorinating cylinder, but "refractory" ores are first roasted. One of the two chlorinating cylinders is made of light steel and is lined with a thin coating of india rubber which protects the steel from the action of the chlorine. It has an automatic valve for charging and discharging and a delivery pipe. There is also an escape valve on the top of the cylinder. The other cylinder is lined with wood. The rubber used for the purpose of lining the cylinder is about an eighth of an inch thick, and is made of pure rubber and not vulcanized. It is found that the chlorine has no action on the rubber, and that the wear and tear from friction practically amounts to nothing. It will be seen that the value of the india rubber lining is thus very great. The chlorinating cylinders are charged as follows: First, 80 lbs. of nitre cake, forming about two per cent of the whole charge, is dropped into the cylinder; then two tons of the ore, and, lastly, 60 lbs. of bleaching powder, or about 1½ per cent of the whole charge. The charging aperture is then closed and a steam injector is turned on, forcing in water till the pressure rises from 70 lbs. to 100 lbs. It is important that all the air in the cylinder should escape, as the presence of air is detrimental to the action of the chlorine, as it mixes with the gas and prevents its liquefying. The cylinder is then revolved, mixing up the ore with the bleaching powder and the nitre cake. The chlorine which is thus liberated, goes into solution, and the pressure forces the strong chlorine liquor into the ore, previously rendered porous by washing. The cylinder is revolved from an hour to an hour and a half, when the contents are discharged on a filter bed placed below. The waste chlorine is blown off and largely recovered by being passed through slaked lime and thus absorbed.

Fig. 1. - THE POLLOK NEW CHLORINATOR AND FILTER BED.

BEST'S IMPROVED GAS ENGINE.

The filter is made of steel wire lined with india rubber. The charge after being deoiled on the filter bed, is filtered, the chlorine liquor containing the gold is drawn off by a specially designed vacuum pump, by which it is pumped into the precipitating tank (Fig. 2), where the gold is precipitated by adding ferric sulphate. The quantity of re-agent used is about 30 pounds to the ton, or 1½ per cent. The precipitating tank is filled with a conical shaped bottom, on which the gold precipitate settles. As soon as the liquor has become clear it is run

off and the gold paste is removed and fused with borax into gold bars.

The chief advantages of this process, as claimed by the patentees, are: 1. The rapid and complete extraction of the gold by the use and application of hydraulic pressure, a machine weighing 25 cwt., being able to put through 24 tons or 12 charges, in 24 hours. 2. The use of dry chemicals which can all be safely and cheaply packed, shipped and carried. A very high percentage is recovered by the process.

Best's Gas Engine.

Daniel Best of San Leandro, the inventor of many agricultural implements, has devised a new gas engine, illustrated on this page, which he is confident is a very superior motor. He has been studying the use of gas and gasoline as a motive power, and by a series of experiments has determined the proper point to take advantage of the combustion of the gases. By the peculiar construction of the spark device, the electric spark can be produced at whatever position of the crank and piston-head may be desired. The ordinary machines can produce the spark only at one place, as they do it automatically by the cylinder head. Mr. Best says that by setting the device to spark at the same place as other gas engines, it required more explosive per minute than it does by his method and time of firing. This is the principal point in the new engine, and one which the inventor claims makes it a very superior piece of machinery.

ACADEMY OF SCIENCES.—The Academy of Sciences met Monday evening with Dr. Harkness presiding, but adjourned without transacting any business, in respect to the memory of Second Vice-President George Hewston, recently deceased.

REPORTS of rich strikes continue to come from the Pine Nut mines, Nev. yet some contend that there is, thus far, only one mine of value there.

THE Allison Ranch mine, which it is expected will shortly be again worked, has yielded \$7840,000 up to the time work was stopped upon it.

CORRESPONDENCE.

We admit, unadvised, opinions of correspondents.—Eds.

Plumas County Mines.

(From our Traveling Correspondent.)

Plumas-Eureka.

The old Plumas-Eureka, T. W. Jenkins, superintendent, is way up at 7300 feet above sea level, on Eureka mountain, and just above the town of Johnsville. The mine is opened by five tunnels. Nos. 1, 2, and 3 are worked out. No. 4 is in 4000 feet and taps the vein 1500 feet deep at the deepest point. The average width has been 30 feet. No. 5 is now in $1\frac{1}{2}$ miles and idle. A shaft has also been put down from the bottom of the lower tunnel for a distance of 150 feet and drifts run 600 feet each way. All of this section of the mine is now idle. At this time ore is coming from the 76 vein. The old Plumas-Eureka vein is considered worked out. The 76 vein is opened by two main tunnels. No. 1 is 800 feet long and shows a vein of from one to six feet wide. No. 2 tunnel a crosscut, 600 feet long, taps the Hoskins vein. The ore from this vein is now the chief source of supply. A drift has been run on the vein 640 feet, showing vein of from one to six feet that averaged \$5 a ton. In working the ores, the cars are brought out by horses, and the ore conveyed down the mountain side by gravity tramways. There are three tramways; the two main ones are 1500 and 1700 feet long. The mill is of 60 stamps, crushing 2.6 tons a day per stamp. The pulp passes over amalgamating plates, then over old-style Hendy concentrators; it is then carried into a plate room and run over a system of plates, after which it passes down the creek to be worked by some 20 arrastras.

The Jamez.

S. W. Cheyne is superintendent of the Jamez M. Co. The mine is $1\frac{1}{2}$ miles south of Johnsville and $3\frac{1}{2}$ miles south of the Plumas-Eureka. The company's territory takes in 700 acres. The altitude of the mine is not quite as lofty as that of the Plumas-Eureka, being 5390 feet. In addition to the 700 acres of mineral ground, the company also has its own water supply which embraces the waters of Wade, Jamez, Rock and Grass lakes which now furnish 300 inches of water and can be increased to a far greater amount by converting the lakes into reservoirs by a system of embankments. The mine is opened by tunnel and shaft. Tunnel No. 1 is in 1700 feet and is intended to drain the shaft, the tunnel runs 800 feet on the vein and shows an average width of two feet; the shaft will intersect the tunnel at 165 feet. It is the superintendent's intention to work the mine through the shaft. Thus far the work is all of a developing character and the work will be continued for another year, or until the owners are satisfied they not only have a mine, but that they have sufficient ore in sight to feed a mill, before they erect one.

The Conelgnée.

This is a Pittsburg company that has been operating for a number of years on the gravel channel between Johnsville and Mohawk. They have got their tunnel in now and are making an appraisal for the channel which they expect to out the coming week. This channel is said to extend from La Ponte, in Sierra, to Genave, in Lassen county. Comparatively speaking, there is next to nothing being done on it.

Quincy.

Quincy is famous for her hotel, the Plumas House, which is not excelled, seldom equaled, in any part of the State outside of the cities. Once this county, "The Switzerland of America," is opened up by railroad, the Plumas House will receive the patronage, the hotel and the beautiful scenery of Plumas deserve. But to get back to the mines. The only quartz mine working in this vicinity is

The Golden Gate.

J. B. Sutton superintendent. The mine is situated eight miles west of Quincy. The vein was worked in the early days and reopened in June, 1890. The vein is almost flat and is stripped and worked in a five-stamp mill. So far, the vein runs from three to six feet and is being worked to a profit at this time.

Crescent Mills.

The Crescent M. & M. Co., A. W. Whitney superintendent, owns a mine in the town of Crescent Mills. The mine has been in operation since 1863, and has produced over \$1,500,000 in working to the 200-foot level of the different veins on the mine, which are five in number. They are gradually merging into each other in depth. The shaft is now going down to the 400-foot level. When down, drifts will be run and the different veins connected. The mill is of 34 stamps and the Crescent is the second mill in the county.

Green Mountain.

This mine, G. P. Cornell Supt., is just above Crescent Mills. The property has been in operation for over 20 years, and in that time has yielded over \$5,000,000. The Green Mountain is opened by six tunnels and worked out down to the fifth and a part of the sixth. The No. 6 tunnel is in about one mile and 400 feet and on the vein fully 1500 feet deep.

The vein runs from 20 to 30 feet in width of

ore that averaged \$7 a ton. The company has acquired the Cherokee mine, which adjoins on the west. This—the Cherokee—has not been worked below the 260-foot level. The drift from the Green Mountain will be extended 800 feet to out the Cherokee at its east end, where it will strike it 1600 feet deep. The Cherokee is known to contain two ounces of ore—one of 300 and one of 400 feet in length in the old workings. How much longer they will be in the 1600-foot level is a matter of conjecture. The mine has a 60-stamp mill, 30 stamps of which are running at this time.

The mills of Plumas county show the marks of age. That they all lost a large amount of gold is proven by the number of arrastras that outside parties run on the tailings from the mills. At the Green Mountain, 18 arrastras paid each \$1 a day for the privilege of working the tailings, and they only caught the free gold. Here, everything that was not free was lost. Mr. Cornell intends changing all that, and in time will have an automatic mill with all the modern appliances for the rapid, economical and efficient working of the ore. Once the Green Mountain gives up 85 per cent of her ore's value, instead of 55 per cent as heretofore, she will crowd the Plumas-Eureka for supremacy.

Greenville.

The Drury & Pacific mines, Geo. Standart, superintendent, are two miles south of Greenville and immediately below the Round Valley reservoir. The mines are opened by tunnels. The 1200-foot tunnel cuts the vein 275 feet deep and shows a width of from five to six feet of \$6 ore. A shaft is being sunk on the Pacific vein, which is 100 feet south of the Drury. Drifts will be run from this shaft to the Drury vein and the mine worked through the Drury tunnel, the shaft being used mostly for ventilation. The Pacific vein is from 12 to 14 feet in width of \$6 ore. The mine has a 20-stamp water-power mill, with 15 stamps in operation at this time. The company owns 320 acres, which gives it 3500 feet on the vein and a large timber tract. The owners have paid for the mine, paid its debts and theirs and developed the property from the proceeds of the mine, and only want time to accumulate a reserve sufficient to erect a modern mill at the mouth of the lower tunnel, which, by the way, is in 250 feet to the vein, 150 feet on the vein, and will come into the upper part of the mine 250 feet deeper than the present works.

Johnnie Bull.

S. Firnstone is superintendent of this mine, which is immediately below the Drury. The mine is opened by tunnels. No. 2 is in 270 feet, and taps the vein 50 feet deep. No. 1 is in 250 feet on the vein, which it cuts 120 feet. The vein is from 12 to 14 feet in width. The last ore milled averaged \$7 a ton. The mine has a five-stamp mill and should, when fully developed, have a 60.

Ophir Consolidated.

J. P. Hall is owner and superintendent of this mine. The Ophir is south of Greenville. The vein is opened by tunnels. No. 1 is on the No. 1 ledge and is in 140 feet, cutting the vein 70 feet deep and showing $2\frac{1}{2}$ feet of vein. No. 2 is in 150 feet and cuts the 18-inch vein 75 feet deep. Mr. Hall is perfecting a rotary quartz-mill, which runs so light that it can be turned and run by hand. When completed, he will work the Ophir ores with the mill.

Driving from Taylorville to Clover Valley, and just out of Taylorville, a range of mountains looms up, and for a long distance shows a bare and rugged side, where the successive snow-slides or avalanches have ground off the mountain's side. Near the summit of the mountain runs the mother lode, 12 feet in width. No prospecting has been done on it, though it crops boldly. A farmer living at the base of the mountain informed me that there was a number of other ledges running parallel and near the mother lode, and that the earth near the veins panned out well in very fine quartz gold. He further showed me some quartz that he had plowed up in his field below the mountain. The quartz was very rich in free gold. When other counties are scratched over from end to end by the prospector, it seems strange that this self-developed section should not even be examined. The snow has cleared off the trees, earth and all the surface rock down to several hundred feet in depth on the vein.

E. F. SCHAEFFLE.

Magnesia Works in Napa County.

EDITORS PRESS:—In going through the mountains in the vicinity of Upper Child's valley, your correspondent stumbled on what may become quite an important industry, and add to the wealth of Napa county as well as to the promoters of the concern. I refer to the magnesia works of Stanley and Bartlett. Mr. W. P. Bartlett, a former journalist, late editor of the *Livermore Herald*, is the manager of the works, and seems quite confident of the success of the enterprise. He assures me that he has contracts for all that they can produce, and as the works and the ledges are located where wood is practically inexhaustible, the ore can be calcined at a very moderate cost.

Mr. Bartlett informed your correspondent that the prepared product, which is practically pure magnesia, is used both at the iron works in connection with the smelting of iron and also by the manufacturers of wood-pulp, which

is now so largely used in the manufacture of paper.

It is to be hoped that the promoters of this enterprise will more than realize their most sanguine expectations. Wealth wrung from the unwilling bosom of the earth benefits many and wrongs no man. Many of the vineyardists in Napa valley are feeling blue over cheap wine and infected vineyards. Let us hope, for the sake of those who have been thus unfortunate, that the future will prove that the quail in the mountains have been roosting over more wealth than has ever been squeezed out of the grapes in the valleys.

The success of this enterprise would be a great boon to the farmers in the vicinity of the works, as it would make a home market for a large quantity of grain and wood. Work was commenced about two months ago, and the furnace was started August 24th.

Rutherford, Napa Co.

The Band Saw.

EDITORS PRESS:—Twenty years ago we thought the band saw the saw of the future. At Eureka, the other day, we saw one that had been constantly in use for 13 months cutting as much lumber as the big double circulars, and turning out nine boards where they cut eight. Mr. Flanagan pointed to his pile of sawdust and said: "I have just been figuring that there is \$100,000 that would have been in my business now, had I put in this band saw 15 years ago." Other mill men reported that band saws were being put in as fast as new mills were built or old ones burned down. Mr. Flanagan insists upon it that they cannot afford to go on cutting an eighth of their lumber unnecessarily into sawdust. That eighth represents a good profit. He has ten hand saws with his outfit. Each is ten inches wide, 56 feet long and about one-eighth inch thick. He has an emery machine that sharpens the teeth mathematically and another equally accurate in swaging the points. Still another device grinds the end down to a feather edge to make an eight-inch lap that when braced together is no thicker than the balance of the saw. Then it must be so hammered that it will be plane as it lies on the block, but concave as it is raised. Some of these little points were the last things to be learned to make a hand saw run steadily and never huckle.

Now the lumber is so true and accurate that dressing in the planer only takes very little off, and the corners fit the try square.

Mr. Flanagan claims there is less saving in power than he expected, but that he gains an eighth in lumber and produces a better quality. The mills are rather quiet now, owing to a limited demand, and are anxiously seeking new markets. There remains 500,000 acres in Humboldt and large tracts in Mendocino and Del Norte of redwood timber land that will scale according to surveys of experts, fifty to seventy thousand feet of merchantable lumber per acre.

FRANK P. CHAPIN.

GRAVEL CHANNELS.—The Ruby Company is reported as putting in a slope to work some portion of their ground which is below the tunnel running south. If we understand the situation, the channel at this point pitches to the northeast, toward the secondary, or deep channel crossed by the old Extension tunnel. The Ruby's main works are now supposed to be in the upper secondary channel, below the altitude of the old Bald Mountain channel, and above the Ruby channel proper. There seem to have been three distinct and separate channels at this point. The first, or upper channel, (old Bald Mountain) ran from north to south; the second, (the B. M. secondary or deep channel) ran southwesterly at this point, crossing the upper channel at an oblique angle; the third or lowest, (the Ruby, or Extension deep channel) running in a southeasterly direction, crossing the Extension and South Fork claims. The gold now being taken out by the Ruby was originally freed from its quartz matrix in the upper or primary Pliocene channel, being precipitated to the lower channel by erosion. Later, this second channel was cut off by the third channel, hence the slope towards the east may be found very much distorted by erosive action towards the lower channel. In the course of time, if this second channel is explored far enough to the southward, it will present the apparently anomalous condition of running both ways. Such another instance of the channels of the different Pliocene periods crossing each other, as is here presented, has never before come under our observation. The attention of the glacial theorists is respectfully directed to nature's record of its works at this point.—*Mr. Messenger*.

SISKIYOU BLUE GRAVEL.—The Yreka Blue Gravel Mining Co. is now more sanguine than ever that it is opening up a good mine. The opinions of all leading mining experts who have visited the mine, is that it will certainly be a successful venture, and that the owners will uncover immense wealth when they strike bedrock. Work is being steadily pushed forward and it is only a question of a very short time when they will demonstrate to the public that immense bodies of rich gravel lie buried up in this country, and that all it lacks is enterprise and capital to give Siskiyou one of the greatest mining booms that she has ever experienced. The Yreka Blue Gravel Co. is composed of men of enterprise, and deserve to succeed.

About Butte County Mines.

The letter below, which was received last night, explains itself, says the *Oroville Mercury*. It is published for several reasons. First, because it is probable that some of the miners may answer the questions by letter better than the *Mercury* can. Second, it shows that the mines of Butte and Plumas counties are attracting attention. Third, it is complimentary to the *Mercury*, as it shows that the paper is in touch with the great mining journals of the country as well as the mining capitalists. Here is the letter:

Editor *Mercury*.—DEAR SIR: In the *Engineering and Mining Journal* of New York, August 1st, there is an article copied from your paper giving the production of the Spanish Ranch district since Wells, Fargo & Co. have been in existence. You place it at over \$25,000,000. The article attracted my attention and I take the liberty of writing you with a view of getting some information about your section. What I would like to know is this: In your opinion, what would the chances be for a few practical mining men with limited means, 1st, as to prospecting; 2d, as to leasing; 3d, as to wages. As to prospecting, is the whole country staked? as to leasing, is there any of it done? if so, the average royalty paid. Please state what wages are, and is the country overrun with men. Are the mines wet? Can the mines be worked all winter? and any general information as would be of interest to a number of men thinking of making Northern California their home. Now, if you will kindly take the trouble to answer this, you will greatly oblige yours truly,

Silver City, Utah.

R. C. FAGER.

In a general way, the *Mercury* answers that the mines of Butte and Plumas offer the most flattering inducements to practical miners, with or without capital. There is more prospecting being done now in quartz and gravel than ever before. There are abundant opportunities to buy rich ledges and gravel claims which have been efficiently developed to prove their wealth, but upon which the owners are unable to place the necessary machinery. The *Mercury* has recorded new and rich finds nearly every week during the past year. As a rule, our mines are easily worked. Miners' wages run from \$2 to a much higher sum, according to intelligence, capacity, reliability and experience. Some leasing of ground from large companies has been done, but it is not a feature of the industry.

Again, we say that the mines of this section are yet in their infancy, notwithstanding the millions that they have so generously yielded. To the practical, energetic young miner, no more inviting field is known to exist anywhere on earth; but a man can't scoop up the gold on the surface. The early miners did that by the bucketful, but they merely skimmed the surface. Hundreds of quartz and gravel mines are now being developed in Butte and Plumas, and while some have lost money on ventures that were ill-advised and poorly managed, the great majority of the mines have paid. Mining in these two counties is sure to give employment to thousands more men than at present, and that in the very near future; hence we conscientiously believe that the young man who has strength, courage and a little capital can find opportunities in our mines that overshadow any others offered in the West.

The Oil Wells.

The California Oil and Gas Development Co., says a Los Angeles exchange, operating on the Mansfield ranch, three miles west of town, on Sixth street, have the derrick up, with the boiler and engine nearly in place. After a few more days of preliminary work they will be ready to fire up and set the drill in motion.

The Washington company has some men at work on its lands in the Tonsley canyon, near Newhall. They are making roads and numerous other preparations for beginning active developments in the early autumn. This company got a pointer from the P. O. Co. a few days ago, by this latter striking a fine well in the Wiley canyon, which adjoins them on the east, the new well being situated about a fourth of a mile east of the Tonsley claim.

Another good bit of news comes from Ventura county. A 200-barrel well has been struck by the Union Co., in Adams canyon, about four miles northwest of Santa Paula. The well, it is said, was located by Dr. Crandall of Pasadena. It is in a new ledge.

The Sunset No. 4, in Hopper canyon, reported last week as a 20-barrel well at a depth of 180 feet, is now said to be a 60-barrel well at a lower level.

At the Baptist College the West End Co. is pumping steadily. As soon as the treasury is replenished, boring will go on again.

At Huron things remain as before reported. The oil is very light, and a wick dipped in it burns almost without smoke. It is still claimed to contain paraffine.

It is not generally known that the first carload of naphthalene ever shipped West was sent from near Santa Barbara by W. H. Burns, the handsome proprietor of the Nadeau. This was away back in 1884 or thereabouts. Mr. Burns is about the best posted oil man in this section.

—E.

ONE OF THE LATEST APPLICATIONS OF ELECTRICITY is in the direction of surgery. It was invented by an Englishman, and consists of a soft iron core surrounded by a coil of insulated copper wire, the pole pieces of different shapes being screwed into the end of the core. A battery of bichromate cells furnishes the current. By means of this instrument it is said to be

possible to remove bits of steel or iron from the eyes of workmen, without laceration, which must, necessarily be the case where the probe or forceps are used, and also to locate and remove bits of metal from different parts of the body, where they may be located, and also can be made useful in drawing such metallic substances from inaccessible or dangerous positions to those more favorable to removal, and it has already been tried in several cases for the removal of needles and other objects from persons thus afflicted, with excellent success.

Prospecting.

The indefatigable prospector for the alluring minerals that lie hidden beneath our rocky mountains is the true pioneer in the fullest sense of the term. With his patient little burro, a sack of flour, a side of bacon and his mining tools, the fearless prospector leaves behind him all of the comforts of civilization, his wife and baby, and following the guiding star of Hope, trudges over rugged mountains and crag-locked cañons, stopping here and there to break and eagerly scan a promising bit of flat or wash a pan of dirt where he fancies he has caught a glimpse of color. Days follow days, and still he wanders onward, farther and farther into the depths of the wild, unbroken maze of nature's rugged handiwork. As the sun sinks behind the snow-capped ranges which rear their lofty heads far above him on every side, he turns his weary companion loose to crop fresh bunches of the tender grass, and lighting his little campfire, cooks his frugal meal, his busy brain weaving wonderful projects of future comfort and plenty for the loved ones who are anxiously awaiting his return, and, worn out at last, he rolls himself in his blankets and beneath the star-spangled canopy of blue sinks into a dreamless slumber, only to awaken and renew his toilsome search for gold.

If Dame Fortune smiles upon his efforts and he returns to his loved ones with the fruits of his arduous toil, hundreds of eager seekers alter the golden spoil follow in his footsteps, and another town is added to the long list of mushroom camps which form the advance guard of civilization. But unhappily, how many of these hardy treasure seekers spend days, months and years in vain search for a short road to silence, only to lay down their quartz-worn pick and spade beside some promising ledge that failed to pan out in paying quantities, and, like the way-worn prospector's life, pined out just as its promise was fairest; and when the snows of winter have melted away under the genial influence of another summer's sun, a rusty pick and spade, a little heap of gold-sprinkled quartz and a ghastly skeleton, bleached and fleshless, are all that is left of the loving husband and father who left his home and family in the vain search for gold. So it is through every man's life, whether the search be for gold, for love, for glory or for fame, some prospectors, with scarcely an effort, are showered with favors by the fickle goddess, while others may toil early and late, endure heart-breaking deprivations and incur the ridicule of mankind only to find, when "life's fitful dream is o'er," that a harvest of chaff and a house built upon the sand is their only reward.—*Silver State.*

Wood River Mines.

The Wood River country, says the Ketchum *Keystone*, has been in disgrace now for a good many years, but there are many and very encouraging indications of a renewal of something like its old prosperity. Of course the initiatory steps had to be taken by our own citizens. Only by their energies and enterprise, and by a practical exemplification of their confidence in the worth of our mines, could the general public be induced to reverse its unfavorable judgment in regard to the section; for confidence had by some means been destroyed, and few could be found who believed there was anything on Wood River beyond a few surface pockets, which it was popularly asserted had been "all worked out." A small number, however, continued to have faith. These remained in the much maligned "digging" and worked away as best they could, and their labors and faith seem now in a fair way to be rewarded, and well rewarded. Halley is already taking out and shipping more ore than ever before since the town was built. Depth has been attained on some of these mines—notably the Red Cloud, Red Elephant, War Dance and Porter Brothers' mines—which have proven permanent and very rich. At Eat Fork, better prospects are being obtained as the shafts go deeper into the earth, and there is now an apparently well founded rumor from them of a strike that will be a surprise when its magnitude is known. At Boulder, the Trapper is developing splendidly. Boyle Mountain is improving daily and will soon be recognized as the best mining section of all this region. Smoky, Galena, Sawtooth, Vienna, Seafoam and the East Fork of Salmon, each and all, are yielding good ore, and nearly all of them in increasing quantities. All of these indications, with the promise of the early completion of a railroad line from Boise City to Butte, which will supply cheaper and speedier transportation facilities for the ores of the country, and lastly, the fact that Ketchum will probably ship as much or more ore this year than ever before, point inevitably to an early and permanent renewal of mining, and a resultant long series of years of prosperity for Wood River.

Revival of Mining in Calaveras.

The Calaveras *Prospect* says: More interest is being taken in mining matters in this county at the present time than for many years, and with brighter prospects. While much of the work is still in the line of exploration, the fact that more mines are taking out pay dirt at the present time than for years before has greatly stimulated the opening of new ground. Many mines that have been prospected in years past and abandoned as worthless have been taken hold of by determined men, and the work of exploration extended till bodies of ore have been exposed that elude the croakers and show conclusively that many of these old mines have never been half prospected. A country that has been so rich in placer gold as this has been is bound to contain large deposits of metal-bearing rock, and it only requires a little nerve and money to find it. The search for gravel channels has but just begun in this county, and we believe that the near future will show that there are many old channels here that have hardly been suspected to exist. The exploration alone in that line during the past six months and the gold taken out in some of the workings certainly warrant this assertion. It is probable, however, that quartz will still continue to be the great attraction for the prospector. With the new processes for working rebellious ores and saving the gold, old mines, considered worthless, will again come to the front, and new mines will be developed. The results in the Woods mine on Indian creek and the Quaker City mine near the Junction are good examples of what can be done with old mines.

The result of the last six months' work is surely encouraging. Another thing that is largely aiding in the development of mines is the fact that mine-owners are beginning to see the folly of asking fabulous prices for mere prospects. The kind of men that make mining pay, and build up a country, are not the ones that buy simple holes in the ground for a fortune, or bond an undeveloped ledge for the price of a well opened mine, and do all the opening at their own expense.

Mining is assuming, more and more every year, the character of legitimate business, and the purchaser wants to receive the worth of his money. A man may be willing to risk a few thousand dollars on a prospect, who would not think of looking at it were several times that money asked. Prospectors and mine-owners are coming to see this, and are asking more reasonable prices for their holdings, and as a result are selling them, at a fair valuation to themselves for the work done, and are at the same time giving the purchaser a chance.

Rich Asphaltum Deposits.

The Ojai Asphalt Co.,—a home company, says the *Ventura Free Press*, composed of W. F. Sherwood, Pres.; Joseph Roth, V. P.; J. S. Collins, Treas.; H. Metcalf, Sec.; and J. S. Briggs—is the owner of several deposits of asphaltum in the upper and lower Ojai valley, of which it is at present working the one in the lower valley located on the hill opposite the noted Theacher orange grove. The latter deposit covers an area of 1½ acres, is from six to eight feet in depth and supposed to contain fifty to sixty thousand tons of crude material. The purpose of the company is to extract a nearly pure asphalt from this crude material, under the belief that the time has arrived when there is a market for it. Hitherto it has been the practice in cities as well as towns to allow contractors to make so called asphalt streets and sidewalks of any sort of material which they could persuade the authorities was suitable for the purpose; but time and experience has shown that such street pavements contain too small a percentage of asphaltum and a vast deal too much of deleterious substances. By this experience, city authorities have come to prescribe the percentage of asphaltum and the quality and cleanliness of the ingredients with which it shall be mixed. The output of the company, which is very near pure and therefore lighter than any other variety per cubic foot, is being prepared with a special view to meeting these new requirements. At the mine it will be readily seen that no transportation expenses upon waste or dross will be incurred. It is the first undertaking of the kind in California, and in the confident belief that while they may be a little in advance of the times, they are certain ultimately to place the undertaking on a remunerative footing. This mining camp on the hillside overlooking the beautiful Ojai valley gives the visitor rather the impression of a picnic ground. The owners have liberally provided commodious buildings for their employees beneath the broad-spreading live oaks, and have supplied every facility for carrying on the business in a thorough and business-like manner.

There are a multitude of uses for asphalt, the largest of which is making street pavements, but enters into the manufacture of coach varnishes, paints, roofings and preservatives, and gives a bright glossy surface to patent leather. It is shipped in open-top boxes 12x12x22, convenient size for handling. It has been submitted to leading manufacturers in the East and was pronounced by them to be superior to any they have seen. Occasionally a shipment is made in barrels containing from 350 to 400 pounds. These mines and their productions should be talked of by all our citizens when visiting elsewhere, and should have the encouragement of all at home. F. M.

Speed is the manager at the mines, Frank Tracy superintendent of blasting, and L. L. Bridger team boss.

Gold and Silver Process.

Mr. Montgomerie, of Dalmore, Ayrshire, in conjunction with Mr. Henry Parkes of London, have discovered a process for the extraction of gold and silver from the refractory gold and silver sulphide ores of the Champion mines, in the Thames district of New Zealand. These ores are well known to be of a very refractory nature, and all the processes now in use have failed to treat them satisfactorily. The best results that have been obtained in former trials were by a process which took 16 hours in treatment, with an extracting power of from 85 to 87 per cent of gold and from 72 to 86 per cent of silver. During the past few months Mr. Montgomerie has personally carried out a large number of experiments at his "Tam o' Shanter" House works on this ore, with the result that he has reduced the time for treatment from 16 hours to 4 hours, and with an extracting power of from 95 to 99 per cent of gold, and from 90 to 95 per cent of silver. From trials on two special grades of the Champion sulphide ores the following results have been obtained without the ore being calcined: Ore assaying 1 oz. 1 dwt. 11 grains gold, and 39 ozs. 4 dwts. 21 grains silver, 98 per cent of the gold and 93 per cent of the silver extracted; and from ore assaying 2 ozs. 9 dwts. gold and 59 ozs. 19 dwts. 7 grains silver, as high as 99.62 per cent of the gold, and 95.39 per cent of the silver have been taken out. In working out the best method for the treatment of these ores a number of valuable data have been arrived at, whereby the ore can be brought to yield up its precious metals, and some of these are specially adapted for certain refractory ores other than those of the type of the Champion ores. It is believed that one or the other of the processes which have been discovered will treat a wide range of the various ores which are now but indifferently treated, and those of a slightly refractory nature may be treated easily with the highest results.—*The Ayr Advertiser.*

SHIPMENTS OF QUICKSILVER.—During August, flasks of quicksilver produced at the mine were shipped from Calistoga to San Francisco as follows:

Napa Con.....	463
Gr Western.....	259
Bradford's.....	141
Sulphur Bank.....	164

Total for the month.....967

The Napa Consolidated mine is producing remarkably well and adds in making the total amount for the month unusually large—greater than during any month within the 24 years ending August 1st last. In January, 1889, the total shipments were 972 flasks, or 15 flasks more than for the past month. The August product of the four mines above mentioned amounts to 73,210 pounds, and at present quoted prices is worth over forty thousand dollars.—*Calistogan.*

BROKEN HILLS.—The annual report of the operations of the Broken Hills Proprietary Mining Co. of New South Wales for the half year ending June 30, 1891, shows results including, in the first place, an actual money return of \$5,531,000 from the sale of silver and lead bullion, with a gross profit of \$3,049,000 to be added to the money already in the treasury—\$1,516,000. Dividends were paid to the aggregate amount of \$2,806,000, leaving the balance in the treasury of \$2,735,000. Up to the 30th of June, 1891, the total output of this property has been \$28,798,000 at a cost of production of \$13,778,000, including sums written off for depreciation of plant. The product to that date has been: Silver, ounces, 25,750,000; lead, tons, 107,038.

FOREIGN COMPANIES IN CALIFORNIA.—Attorney-General Hart has under consideration the question whether or not a corporation organized outside of California can own railroad franchises in the State? The question, the Attorney-General says, is asked by a railroad company that designs to lay tracks to this city and become a competitor of the Southern Pacific. The Attorney-General says the question must also be decided for the benefit of certain street railways and other corporations. If they can own a franchise here how are they to be controlled by the Legislature of the State? Every corporation doing business in this State outside the power of its franchise is liable to a fine of \$5000, so says the Attorney-General.

A RARE SPECIMEN.—Mr. J. S. Whiteman of Cajon, in this county, is the fortunate possessor of a portion of the lower jaw of a mastodon maxilla, left side. It is 27 inches long, but was broken into two parts by the plow which raised it at the time it was found. This portion of the jaw is 7½ inches broad and five inches thick and contains one grinder tooth and a portion of two other teeth. The longest diameter of the top of the grinder (anterior posterior) is 7½ inches, while the shorter diameter is 3½ inches. This specimen was found while constructing the Santa Fe railroad through that part of the pass.—*San Bernardino Times-Index.*

A SIX-INCH vein of coal has been struck near Del Mar, San Diego county. The lignite comes to the surface.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

EL LEOPOLDO G. & S. M. CO., Aug. 28. Capital stock, \$1,000,000. Directors—F. Chappet, J. F. McCarthy, L. Bazet, D. E. Hayes and John Morton.

MCGO BAY IMPROVEMENT CO., Aug. 28. Location, San Luis Obispo Co., Cal. Capital stock, \$300,000. Directors—L. P. Branch, L. F. Gilmore, J. G. Scribner, G. W. Schell and L. J. Shank.

WATSONVILLE CREAMERY AND CATTLE CO., Aug. 28. Capital stock, \$100,000. Directors—J. Loud, F. J. Koster, W. Maison, M. H. Weed and B. J. Hoffacker.

HANFORD PARK AND TRADING CO., Aug. 31. Capital stock, \$100,000. Directors—I. H. Jacobs, N. Manasse, J. Manasse, S. I. and K. Simon.

SUNSET VINEYARD CO., Sept. 2. Capital stock, \$80,000. Directors—M. M. Johnson, J. W. Busbaker, M. W. Upton, E. E. Bush and C. T. Bridge.

LATHROP-FLINT CO., Sept. 2. Object, to carry on a land business. Capital stock, \$150,000. Directors, E. P. and G. M. Flint, C. F. and C. G. Lathrop and R. M. Lyman.

River-Beds and Tunnels.

A new river-bed mining scheme is proposed at a point between Hamptonville and Millerton on the San Joaquin river in Fresno county, where they are talking of making a tunnel, so the water may be diverted from the old bed. There has always been a tradition among miners that the bed of the river at this place is exceedingly rich in gold. The channel is filled with sand-bars. The bedrock is of granite. Along both banks placer mining has been carried on for 40 years and many rich patches have been found. The water of the river always prevented miners from prosecuting the work farther than the low-water mark. The bedrock dips toward the middle of the stream beneath deep deposits of sand and gravel. The farther toward the center men have been able to go the richer the deposits found.

Within the past week claims have been located all along the river, and where the channel is supposed to be rich. A survey has been made with a view of turning the river so as to leave the channel in a condition to be worked.

Wlogdamming a river is a common way of getting at the bed at a certain point, and is still practiced at many places in this State. Plenty of money has been made by mining on this system. But diverting the river by a tunnel is a pretty expensive job and thus far no money has been made at it. The two largest schemes of this kind have promised returns for some years, but up to this date the returns have not been what was expected by any means.

FINE GOLD IN PLACERS.—It is the experience of every observant miner that a large quantity of fine gold is not saved in ordinary hydraulic processes, even where the undercurrents are used. For years inventive minds have been experimenting in the effort to discover a method that will prevent this waste. During the past two or three years substantial progress has been made, most of the experiments being on the line of eliminating the heavy gravel, saving the fine sand and silt, and treating this residuum with an amalgamating process, by which means great economy is accomplished in the amount of water required and the flour gold saved. The *Journal* believes that some of these processes will, in time, be eminently successful. A recent inventor in the field is Henry Hartman, of Ogden; concerning his invention the *Salt Lake Tribune* says:

"It is a machine for saving the flour gold of Snake river and experienced mining men regard it with great favor. A test was made a few days ago in the presence of a number of mining men with sand from Snake river, and as far as could be observed the test was a success. Gold was obtained from the pan in minute quantities. The point of the invention is saving the water with which the sand is washed. The sand is screened through four graded screens and goes into a hopper, where the water is turned on, and from there goes into the jigger. The sand is deposited, thoroughly washed in another hopper, the water passes into a receptacle where the sediment is allowed to collect and is then treated. Mr. Hartman claims that his machine will solve the question of saving the great quantities of flour gold in Snake river."

COIN IN THE SUB TREASURY.—Assistant Treasurer of the United States J. P. Jackson reports cash on hand on August 31st as follows: United States notes, \$50,213; national bank notes, \$7585; gold certificates, \$2640; silver certificates, \$297,040; gold coin, \$46,047,669; standard silver dollars, \$21,589,426; subsidiary silver coin, \$4,543,269 65; minor coin, \$10,091.15. Total, \$72,547,953.80. Shipments during August, \$319,938.

THE BEAR VALLEY WATER CO., San Bernardino, has commenced work on its new dam, to cost \$500,000. It will require two years to complete the dam to 80 feet. Wm. Ham. Hall is examining the Bear Valley water system, and will soon report on the same, in connection with the Alessandro and Perris irrigation districts.

THE Congressional party has been successful in Chili, and the war closed. In a short time mining and other work will again go on as usual.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SULPHURETS.—Amador *Ledger*, Sept. 3: The sulphurets from the Hardenburgh mine at Middle Bar are being shipped to the reduction works at Sutter Creek. W. H. Miller, manager of the Huntington roller quartz mill, came up from San Francisco Monday night to see about the erection of the large mill of this make on the New York claim in John Bull gulch, below Jackson. His principal business was to ascertain if he can get the necessary lumber from the mills here. The machinery will probably be shipped from the city next week, as they will not be ready for it before then. The two-stamp mill has been running on the Mello and Questa claim at Jackson Gate for three weeks. A. Mello informs us that everything points to a satisfactory yield, although no regular cleanup has been made, and none will be made until a full month's run has been had.

SUTTER CREEK.—The mining industry in this vicinity is progressing favorably. The North Star is the only point that wears a discouraging aspect. In drifting, they have reached the boundary line of the claim, and some distance over. The ground is found to be harder and less encouraging than at any time in the past. In all probability the last assessment has been levied, as many of the stockholders think the ground has been pretty thoroughly prospected, and are loth to put any more money in the venture. Surface work at the Hector is drawing to a close, and in a short time they will be ready to commence the repairing of the shaft. The elevator that is being put in at the mill is almost completed, and will soon be ready to raise the ore from the ground to the mill dump above. In the meantime the mill is kept running steadily. Sinking is going right along at the South Eureka, and the ground is of a nature to admit of rapid headway being made. At the Belmont, a steady improvement is noticeable as developments proceed.

Butte.

BIG BENO MINE.—Oroville *Register*, Sept. 3: Forty miners are now employed at this mine and two localities are being worked, one is at Island Bar near the foot of the mine and the other at Huff's Bar at the upper end of the mine. The two places are 10 or 12 miles apart. At Huff's Bar they are stripping an ancient river channel on which large white oaks are now growing. The section that is being cleared is about 40 feet up and down the stream and some 60 feet across it. The gravel here is from 20 to 25 feet deep and this must all be removed by wheelbarrows before the pay dirt can be reached. This pay dirt is from three to five feet deep. The rocks are removed by powerful hand-derricks or cranes, while the mine is kept dry by means of a steam pump. To get this engine to its place it was necessary to let it down the mountain half a mile on skids. At this place 30 men are at work under L. Wakeman, but we are not able to learn the amount of gold that is being taken out. On Island Bar there are ten men under James Rowe and they are working in the bed of the present stream. The mine is kept dry by means of a China pump run by an overshoot wheel. They expect to strike pay dirt at this point in a few days, and it is hoped that something rich will be found. We obtained these facts from A. K. Beatson, the superintendent of the mine who was in Oroville a few days ago.

Calaveras.

A NEW MINING ENTERPRISE.—Calaveras *Prospect*, Sept. 5: The Home Stake and Golden Reef quartz mines on Indian Creek near the famous Cluniff mine, are about to be worked in a systematic and thorough manner. These mines have been owned and worked for some time by George Hengen and others, and extensive prospecting has been carried on. Lately a company has been incorporated in San Francisco to push the work on both mines. Most of the shares of the stock are held by wealthy San Francisco parties. Preparations are being made rapidly, and in a few days quite a large force of men will be at work.

CAMPO SECO.—The reports from this section continue favorable. A large force of men is continually at work taking out ore and on the extension of the works. We learn that as these works are completed, more men will be employed. Mr. A. Shaw of San Domingo, who recently relocated the old Green claim near Macaroni Flat, has been prospecting that ground with good results. We learn that at a depth of 60 feet, very rich rock has been found with a well-developed vein.

BIG FLOW OF WATER.—Calaveras *Chronicle*, Sept. 5: In the Quaker City mine a big flow of water was struck last Saturday. The shaft is down between 500 and 600 feet. The water came in while the men were off shift. Within an hour's time the water rose ten feet in the shaft, and in 24 hours it had risen 125 feet, where it appeared at a standstill. Owing to the water being turned out of the Campo Seco canal, which furnishes the motive power for the mine, the work of taking out the water has been delayed for a few days, but as soon as the water is turned on the work of freeing the mine will be commenced.

SPLENOIT ROCK.—Some specimens of exceedingly rich rock are on exhibition on Main street. The rock is from the mine of S. S. Moser in Tunnel Ridge. Mr. Moser's property makes an extraordinarily fine showing.

El Dorado.

GOOD REPORTS.—Georgetown *Gazette*, Sept. 3: Good reports come from the Darling mine as the shaft goes down. C. H. Langley, careener and millwright, is engaged in putting up a Kendall mill for the Beatrice Bros. on their Canyon Creek mine, about a mile north of the Armstrong & Ritchie mine.

GRAVEL.—Reports come from Volcanoville this week that Mr. Everts has struck into very rich gravel in his tunnel, which he has been driving for a long time at considerable depth to tap the ancient river channel.

LEASED.—The famous old Parsons mine, north of town, has been leased by John H. Anderson for three years. Mr. Anderson has gone to Santa Rosa for a couple of weeks, when he will return and begin the work of equipping the mine ready to start up

business after the fall rains. He will put in 1800 feet of sluice boxes and lay 400 feet of pipe to convey water to a nozzle for washing the ground into his sluices. This is a commendable enterprise and properly managed, is sure to prove profitable.

Fresno.

NEW OIL WELLS.—Fresno *Republican*, Sept. 5: A workman who has been assisting the well-borers in the west side region of Fresno county, was in town yesterday and reports a remarkable find of oil. He says that for some weeks past two experienced well-borers named Tierce and Lauer of Los Angeles have been at work about ten miles north of Coalinga, on land owned by San Francisco and Los Angeles capitalists. He corroborates the report received from two other sources last week. The flow of petroleum oil struck by the borers is in a black slate formation, 267 feet from the surface, which flows out of the top of the well. They went down about 40 feet farther and have suspended work in a rock, which they say is simply a large boulder and not bedrock. Agent Craig, of the Standard Oil Co., has visited the well and examined the oil, which he pronounces 82 per cent. Work on the well has been temporarily suspended in contemplation of a trade now being negotiated between the owners of the well and the Puente Oil Co. of Los Angeles. It is understood that several Frenchmen will leave here tomorrow for further investigations in the oil district to the west. Small oil wells have been worked there for a year or more, but the present flow is the largest one yet recorded.

Nevada.

BROKE INTO THE OLD WORKS.—*Transcript*, Sept. 4: At 2:20 o'clock yesterday afternoon the main drift of the Harmony Mining Company broke through into the old mine 1100 or 1200 feet north of the new incline. Wm. Osborne and M. Mitchell were in the head of the drift and the big body of water in the old works began to pour in on them. They beat a hasty retreat, falling down twice, but managed to keep ahead of the water. Mr. Osborne left his dinner bucket behind and the watches of Foreman McCoy and Robert Holland are in the drift where their owners left them. The new works are flooded and the water comes up into the incline. The work of bailing it out has begun and as soon as it is completed the company will explore the old mine which they have been driving to reach.

Plumas.

LONE STAR.—Plumas *Co. Bulletin*, Sept. 2: This property, recently sold by L. V. Tefft to an Oakland Co., consists of 160 acres near Cromberg. It breaks into the Middle Feather. It was operated last spring but is now idle. Although a placer mine, all debris from it is dumped on a flat. When first enjoined, Mr. Tefft says he was making \$100 per day. The present owners will make extensive improvements and by drifting will open up a large body of gravel.

THE RICH GULCH owned by Wm. Langhorst and Thos. Hartley is on Poplar creek, seven miles from Cromberg. It has been worked during three summers. Just a few days before our visit a \$45 nugget was found in the mine. The owners consider their prospects good.

NIGGER BAR.—Frank Johnson and Henry Baker are working a river claim here. The fluming of the river has been completed and work on the channel is now in progress.

THE CONSIGNEE.—This property is owned by a Pittsburg Co. and they have been operating it during the past eight years. The tunnel is driven into the hill on the east side of the Feather river canyon 2200 feet, and Mr. Trayner, the superintendent, expects to break into the channel any day.

MAYN & BENNETT.—These gentlemen are opening up the same channel as that sought by the Pittsburg people, about two miles from the Consignee. They have drifted 350 feet and believe they will soon break into gravel.

THE OHIO is operated by Nickrem & McKenzie and is in the upper end of Mohawk valley, near the Sierra county line, just below the Steelmao & Hayes, which last year took out \$45,000.

MILLER & COOK own a property in Mohawk valley which during the season closed, yielded \$3000, and that with very little expense.

WEST ELIZABETH.—This is a drift mine eight miles from Johnsville, on Poplar creek, and is owned by W. J. Miller. The lower tunnel is in 1382 feet and the upper 647, the two being connected. They cross the channel. The prospects of the mine are said to be fair.

THE SKOWHEGAN is a gravel mine owned by C. H. Clark and worked during the past seven years. It is paying well.

O. B. DOLLY owns a mine below old Jamison City. He worked it last spring and it paid well. **GARFIELD FLAT**, situated on Squirrel creek and owned by Peter Lorenzo, has been operated twelve years successfully. Nick Ross & Co. now work the mine. Quite a handsome sum of money has been extracted and its future looks bright.

SUNNYSIDE.—This is an incorporated mine on which work began in 1882. It was operated by the hydraulic process, but now drifting has been adopted. Many improvements are being made, sheds, dump-houses, etc., for winter work. Over \$75,000 has been taken out, including many very large nuggets. In 1890, the largest found weighed \$3267, others \$1188, \$618, \$520, \$500, \$250, \$300 and \$200 respectively, while numerous smaller nuggets were obtained, ranging from \$200 down. The principal owners of stock in this mine are the Jones Bros., D. McFarlane, Wm. Gibson, W. A. Sperry, Mercer Estate and Wm. Thomas.

CANYON PLACER is on Bear and Eureka creeks and owned by John M. Jackson, who is getting ready for operations next year. There is a large bank of gravel and a good water privilege. The prospects are claimed to be good.

GARBON & NEEY own part of the old Ohio claim, Nickrem & McKenzie being the owners of the other part. It was worked successfully last spring when a \$70 nugget was obtained. It is a large property.

LITTLE JAMISON.—Work continues on this noted property with regularity. Of the corporation, John Nevil is president and Sam W. Cheney, superintendent. M. A. Kerr is the efficient underground foreman. Numerous surface improvements have been made, such as a fine office and dwelling, stables, storehouse, boarding-house, etc., all indicating great confidence in the future of the property. A drain tunnel is now being run to tap a vertical shaft. This tunnel is now in 650 feet, with 1000 feet more

to run. The tunnel will intersect the shaft 165 feet from the surface.

PLUMAS EUREKA.—This old and reliable property continues its ample yield of bullion, yet the force of men employed in and about the mine is less than for several years past. The force of men is about 200. The mine is operated in a very economical manner.

San Diego.

AROUND JULIAN.—*Sentinel*, Sept. 3: There was joyful tidings from the Cincinnati Belle on the Saturday evening shift, a bunch of ore of wonderful richness being cut into. It has been stated that one man took out enough ore during the shift to pay all expenses that have been incurred since the reopening of the mine. With the Kerr mill working up small lots of ore there will be a decided stimulus for owners of claims to thoroughly open them up and have a test run made. We predict this will bring to light some rich finds. The veteran miner, Jerome Macdonald, is running a cut on the Bloomfield, with the prospect of cutting the ledge that made the Golden Chariot famous. It is rumored that the old dump of the Golden Chariot to the amount of 2000 tons is to be run through the Kerr mill at Banner. The new five-stamp mill for the Black Eagle mine on Mesa Grande is on the ground, in sections, awaiting the arrival of the superintendent to be put in place.

Shaasta.

A RICH DISCOVERY.—*Redding Free Press*, Sept. 5: J. T. Brown recently made a rich strike on the south fork of Deadwood, in Trinity, on the line of Shaasta county. In a shaft 40 feet from the grass roots Mr. Brown discovered a ledge four feet wide of ochre and gold. The gold comes out in chunks as large as hazel nuts, weighing from \$2 to \$4 each. It is simply a decomposed mass of wealth. The ledge was discovered about two years ago, and this rich strike is the result of assessment work. Mr. Brown thinks there are thousands of tons of ore and the ledge gets larger and richer as he goes down into the bosom of mother earth. The claim is on the top of the mountain and the locality has not been prospected much. There are several springs near by, and dirt taken from them yields good prospects. Geo. Klein, a pioneer miner of Deadwood, says that it is the richest discovery ever made in that section. Mr. Brown, so far, has a monopoly.

Sierra.

ROCKY PEAK.—*Mt. Messenger*, Aug. 29: Work has been begun anew on the Rocky Peak drift gravel claim, on the ridge between Eureka and Brandy City. A large amount of money has been spent on this ground in years past, but without developing a paying claim. The owners were not discouraged, however, but have gone down the ridge about a mile and a quarter, started again and have already found pipeclay, which is a very strong indication of a gravel channel.

CARNEY.—The mill on the Carney quartz ledge, at the head of Jim Crow canyon, was ready to run Wednesday morning, with the exception of some battery plates which were to be taken up that day.

THE GOLDEN GIANT M. Co. is running its main tunnel ahead to get under the channel, which was indicated by the last raise.

KEYSTONE.—*Mt. Messenger*, Sept. 5: Senator Mead has recently sunk down on a new chute of ore on the Keystone ledge. In 16 feet the pay chimney widened from six inches to 26 inches, and the rock yields \$15 a ton. This is one of the most extensive, valuable and promising quartz properties in Sierra county, and only needs a reasonable amount of capital to make it fully equal, if not surpass, the noted Sierra Buttes.

EXTENSION.—Cleanup at the Bald Mt. Ex. drift mine, for last week's work, was 105½ ounces, one nugget weighing 14 ounces. Total gold yield for the past four weeks—24 working days—425½ ounces, very good, considering the small force of drifters employed.

BEOROCK has been reached with the tunnel being extended from the bottom of Thistle Shaft up the ridge toward Gibsonville, but we have not learned of any gravel prospect.

Siskiyou.

CINNABAR.—*Siskiyou Telegram*, Sept. 5: Operations at the Cinnabar mine on Beaver Creek are progressing finely, and the new furnace is nearly completed. The reduction of ores will be commenced this week, and good results are expected. The ore veins have been pronounced as marvelous, both as to size and richness. There has lately been found several new veins in different parts of the mine averaging from two to ten feet in width, and all give the most favorable indications of both permanency and richness.

RIVER MINERS.—*Yreka Journal*, Aug. 29: The river miners all along the Klamath are getting down to bedrock in the channel and some of them are taking out rich pay gravel, with prospects of a big yield during the fall months until December.

CINNABAR.—We learn that the furnaces are nearly completed at the cinnabar mines on the west fork of Beaver, Siskiyou mountain, and that the reduction of ore will be commenced about Sept. 5th. The ore veins found are really marvelous in richness and extent, comprising three or four ledges in the mines from two to ten feet in width. The Beaver Creek cinnabar mines of this county, near the Oregon line, are destined to become the most extensive on the coast in producing quicksilver of the very best quality.

GRAVEL.—Lee, Lasb & Co. of the Greenhorn blue gravel mine started their pump again last week, which was sent to Portland for repairs, and commenced work on Monday in taking out pay gravel at the new shaft. The company expects to realize as rich and extensive body of blue gravel in a short time as at the old shaft and tunnel farther up the creek where the cave occurred. The shaft of the Yreka blue gravel mine is now down about 93 feet, with the blue gravel getting coarser, an indication of nearing bedrock.

Trinity.

THE RIDGEWAY.—*Trinity Journal*, Sept. 5: A letter from New River informs us that the Ridgeway mill started up last Thursday and that everything works well. The ledge runs from four feet to eight feet in width and four men can about keep the mill running 12 hours. The rock looks very well and the owners will no doubt make a good cleanup.

HALF GOLD.—The recent strike on Canon creek, known as the Maple is looking very well. They are

now sinking on the ledge, and we are informed that about 1½ inches of the rock on the footwall is nearly half gold. This is expected to develop into a good property.

GOOD ROCK.—The Enterprise Co. has again struck good rock in the old Enterprise ground. The rock is easy to work and rich. This company has a good property and it is paying well.

NEVADA.

Washoe District.

CON. CAL. & VA. MINE.—*Virginia Chronicle*, Sept. 5: Have continued to extract some ore from the openings on the 1300, 1500 and 1600 levels. 1650 level—Have continued to extract ore of fair quality from the drift run west from the top of the upraise carried up 59 feet above the southwest drift. Ore of fair quality has been extracted through the drift run east from the winze No. 3 (down 73 feet) in working upward from that point. 1750 level—In working out and upward from the bottom of winze No. 2 sunk from the 1650 level, we continue to extract ore of fair quality. There have been extracted from all parts of the mine during the week 1005 1310-2000 tons of ore, which were shipped to the Morgan mill. The average assay value of all of the ore worked at that mill during the week (980 tons) was \$20.02 per ton. Bullion shipped to Carson Mint, \$34,631.20.

OPHIR.—We have extracted and raised to the surface 58 tons of ore, the average assay value of which is about \$22.50 per ton. 1500—Have continued repairs on the incline leading from the shaft station on this level.

MEXICAN.—On the 1465 level, the south drift started from the east crosscut No. 1, at a point 618 feet in from the main north lateral drift, has been advanced 22 feet; total length, 242 feet; in a harder porphyry formation showing clay separations.

UNION CON.—From the east crosscut No. 2, on the 1465 level, at a point 1070 feet in from the main north lateral drift, a north drift, No. 2, was started and has been advanced 22 feet, in a soft porphyry formation.

CHOLLAR.—The east crosscut, 40 feet north of south line, 1100 level, is out 22 feet; face in quartz and porphyry, yielding assays from \$4 to \$10 a ton. The north lateral drift from the incline station, 1500 level, is out 29 feet; face in porphyry. The south lateral drift from the incline station, same level, is out 25 feet; face in porphyry.

POTOSTI.—The east crosscut, 100 feet south of north line, 1100 level, is out 104 feet; face in quartz and porphyry. The east crosscut, on the south line, 1300 level, is out 16 feet; the last four feet in quartz yielding low assays. The south lateral drift from the winze station, 1400 level, is out 19 feet; the face is in porphyry. The south drift, same level, is out 20 feet; the face is in porphyry.

ALPHA.—Are still re timbering the shaft.

EXCHEQUER.—There has been no work done on the 600 level during the week, owing to timbering the Alpha shaft. The joint south drift from the 1800 station of the Ward shaft is out 304 feet, the face is in porphyry.

BULLION.—The east crosscut on north line, 1300 level, is out 16 feet; the face is in porphyry and quartz yielding low assays. The joint south drift from the Potosi winze station, 1400 level station, is out 19 feet; the face is in porphyry.

SILVER HILL.—The southwest drift is out from the shaft 280 feet; the face is in quartz and porphyry. On the 160 level, the south crosscut is out from the winze 690 feet; face in hard porphyry.

UNION SHAFT.—The west drift from the shaft, 900 level, has a total distance west of shaft of 1039 feet; the face is in day and porphyry.

WARO COMBINATION SHAFT.—The joint south-west drift from the shaft, 1800 level, is out 304 feet; face in porphyry.

ANDES.—On the 420 level, north drift from east crosscut No. 3 was extended 16 feet in quartz formation. East crosscut No. 4 from the main north drift advanced 18 feet; face in quartz and porphyry.

OCCIDENTAL.—Have extracted and sent to the mill from all parts of the mine 295 tons of ore of the average value of \$18.30 a ton, as per battery samples. The winze from No. 2 crosscut, 100 feet south of the station on the 650 level, is down 19 feet in ore assaying \$15 a ton. During the month of August and part of July, the mill worked 2012 tons of ore of the average assay value of \$17.60 a ton, from which \$30,936 were produced in concentrates and bullion. The rock was worked to 87 per cent of its assay value.

GOULO & CURRY.—200 level: All work in top of upraise No. 2 has been stopped. Resumed work in main south drift at a point 125 feet from west crosscut No. 1 and extended same 30 feet through soft porphyry; total length 155 feet. East crosscut No. 2, 65 feet above 200 level, has been extended 18 feet through quartz and porphyry; total length 28 feet. Started a west crosscut, No. 2, opposite east crosscut, and advanced same 25 feet through soft porphyry.

Hawthorne District.

LAPANTA.—Walker Lake *Bulletin*, Sept. 2: The stopes above the No. 6 incline continue to show about the same. In the winze below the 100-foot shaft level, east crosscut has reached the footwall, and drifts are being run each way along same, the drift to the west showing a fine body of \$80-ore. The east drift is in low-grade quartz and iron. The formation is very large.

PAMLCIO.—No particular change to note. Everything running about the same.

IDA.—Extracting the usual amount of ore. **CAPITAL.**—Tunnel in 128 feet; ledge pitching eastward. There is some ore in the tunnel of very high grade. Expect to reach the main ledge early next week.

WAR EAGLE.—Still driving tunnel to tap the ledge. Tunnel is now in 160 feet. Will reach the ledge in a few days.

RIP VAN WINKLE (Marietta).—Taking up bottom and leveling tunnel to lay track. Twenty tons of silver lead ore shipped this week.

JENNY LINO (Marietta).—Vein in the stope above the north drift showing very well, and turning out considerable ore.

CENTRAL.—Stopping above the north drift, 130-foot level; producing the usual amount of ore.

MOUNTAIN KING.—Winze below the north drift in the main tunnel still being sunk, following the vein.

FAIRMOUNT.—Drifting north and south from the

bottom of the winze below the tunnel and stoping above the north drift; vein turning out very well.

HARTFORD.—Still sinking in the vein; ledge showing well.

Montgomery District.

A PROSPECTOR'S RETURN.—Calaveras Prospect, Sept. 5: W. T. Hull of Sheep Ranch, who went to the Mohave country to examine into the Montgomery discoveries in that region, returned this week. He reports that the Montgomery party have done fairly well, have one good mine, working rock with a small Kendall mill, but he does not highly recommend the country. He says it is too far from anywhere or anything. Water is hauled seven miles, freight costs five cents a pound from the R. R. and the one mine is the only one in which gold in paying quantities has been found.

ARIZONA.

WINTER PROSPECTS.—Tombstone Prospector, Sept. 3: There has been much talk of what is going to be done this winter in mining matters. Already there is renewed activity shown in Tombstone. More men are being put to work on the T. M. & M. Co.'s properties and also on the Comet. It is more than likely that several minor properties will start up this fall. It is announced also that the Grand Central mill will start up on October 1st on ore from the Seaverns mines. The ore has been tested and found to be profitable to work there. On what understanding the ore is to be worked we are not able to say. Si Bryant's property will be examined by Si White, who arrived yesterday. The ore from this mine is a milling proposition, and it is not at all unlikely that before two months have rolled by the Contention stamps will be dropping on Tom Scott ore.

IDAHO.

WORKING ORE AT FLINT.—De Lamar Nugget, Sept. 1: Some two years ago, Mr. M. F. Leech bought the Last Chance mine, one mile north of Flint, and since then has been devising a method to work the ores. Last fall he leased the mill from the Nebraska owners, at the same time securing an option on the entire Flint property for \$300,000, and began experimenting to save the value in the rock. He put in a battery of ten stamps and a number of small jig concentrators, and has experimented for several months. The results have been sufficiently satisfactory to warrant him to decide to take the property on his option, and to proceed to make permanent improvements on the mill. All of the old machinery except the power, has been taken out of the mill and discarded; the battery at first put up on the ground floor, has been removed to the floor where the rolls were formerly located, and the mill arranged for adding 40 more stamps, for which number there is ample room. The ore from the crusher runs into a bin from whence it drops into Hendy automatic feeders and is fed to the battery. It is discharged from the battery through 60-mesh screens, placed eight inches above the dies, on to the jig tables. The tailings from the jigs run over an incline table, covered with canvas, where a portion of the remaining value is saved, thence on a second table, and so on indefinitely, until the loss in the tailings is reduced to a minimum. At the present time only two tables are used, but two more will be added. The loss now in the tailings, working \$30-dollar ore, is about \$8, accruing chiefly from a percentage of rosin zinc which the ore carries. The present cost of milling the ore is something less than \$2 per ton; but with five times as many stamps at work and the machinery perfected, Mr. Seely, who has charge of the mill, estimates the cost can be reduced to about 80 cents per ton. Twenty-six tons of ore are now reduced to one ton of concentrates. It will be seen from the foregoing that very low-grade ore of this character, where it can be cheaply mined, can be made to pay. It is a revolution, or rather a resurrection for an extensive mining district which has been pronounced played out.

MONTANA.

CASTLE DEPOSITS.—Castle Tribune, Aug. 29: The ore bodies of this district are usually found on or near the surface, covered with an iron cap, which is non-mineral bearing. Immediately underlying this crust exists the ore. It is composed of carbonate of lead, containing a small amount of sulphates. It is also mixed with varying amounts of silica and oxide of iron. This ore maintains its carbonized character to an unusual depth. It is found in the Cumberland at a depth of 500 feet, which is the deepest workings. The character of the ore of this district will be found to change as it is more and more removed from atmospheric influences and approaches the water level. Here it may be expected to be encountered in its primary condition, that of a sulphide. The ore bodies of the Castle district are most usually found lying between a lime and porphyry formation. The veins run conformable to the strike. In these ledges the ore shoots occur at intervals. In the Cumberland, the mineral is found in lime, the same formation in which most of the great carbonate mines of Leadville existed. There are portions of the district in which the mineral is found in a contact lying between granite and porphyry, as on the Princess hill. On the Four Mile the leads are mostly true fissures in a granite formation.

NEW MEXICO.

DEVELOPMENT WORK.—Silver City Enterprise, Sept. 4: The shipments of iron ore from Silver City for the past eight months ending August 30th were in round numbers 13,846,951 pounds, or a trifle in excess of 346 carloads of 20 tons each. The Arizona Copper Co. concentrates 20 tons of ore daily, and the smelter turns out nine tons of bullion. The San Francisco river forces a 3½-foot Leffel wheel to yield 120-horse power. T. W. Holson, who owns the True Blue at Lone Mountain, has extracted 140 sacks of ore which assayed 2743.07 ounces per ton. Supt. Foster, from Gold Hill, reports everything flourishing in that vicinity. The Reservation, the boss mine of the camp, is down 120 feet and drifting is in progress. Good ore in quantity is being extracted, and the management is highly pleased with the outlook. A small gold brick weighing 240 ounces was taken out as the result from 30 tons of ore. From January 1st to August 30th, a period of eight months, Wells, Fargo & Co. have shipped

from this city \$131,555 in gold and \$9876 in silver bullion. A considerable amount has been disposed of through the banks and other sources, roughly estimated at 33 per cent of the above amount, which added, gives a fair idea of what our mines have produced.

OREGON.

ASBESTUS.—Jacksonville Times, Sept. 3: Captain Bell and his assistants are at work in the asbestos fields in the Meadows district, and important news from that source may be looked for at any time now. The fields are extensive, and before they can be worked to any extent it will be necessary to open a road into the mines, and that will occupy the attention of all hands during the next few weeks.

QUARTZ.—E. Sanderson Smith, while on his trip to San Francisco and Portland, secured the co-operation of enough capital to ensure the thorough prospecting of the quartz mines at Steamboat and Gold Hill that he is interested in. There is no doubt but what this property is valuable, but it requires the outlay of a great amount of capital to develop it.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

- REPORT FOR WEEK ENDING SEPT. 1, 1891.
- 458,761.—TUG HOOK.—J. H. Boothe, Hollister, Cal.
- 458,762.—VARIABLE NOZZLE.—A. A. Charonnat, Nevada City, Cal.
- 458,680.—VENOING MACHINE.—Durie & Begg, Seattle, Wash.
- 458,681.—VENDING MACHINE.—Durie & Begg, Seattle, Wash.
- 458,565.—APPARATUS FOR RAISING SUNKEN VESSELS.—J. G. Enke, Los Angeles, Cal.
- 458,828.—PREPARING SKINS.—G. H. Farthing, San Jose, Cal.
- 458,574.—CABLE GRIP.—Hansell & Gill, S. F.
- 458,581.—DRILL PRESS.—A. E. Johnson, Carson, Nev.
- 458,852.—BLACKBOARD.—W. H. Larew, Mari-pa, Cal.
- 458,763.—LUMBER CLAMP.—W. A. Madden, Madera, Cal.
- 458,765.—ELEVATOR SAFETY DEVICE.—Moen-ning & Haeseler, S. F.
- 458,766.—WINDMILL.—M. S. Pires, Centerville, Cal.
- 458,758.—PILLOW SHAM HOLOER.—Rutherford & Roberson, Napa, Cal.
- 458,759.—CAR TRUCK.—W. H. Siebecker, S. F.
- 458,698.—FEE-O-WATER HEATER.—B. W. Taylor, Los Angeles, Cal.
- 458,671.—CAR AXLE.—H. P. Willard, Tustin, Cal.
- 458,930.—TABLE.—F. E. Wood, San Jacinto, Cal.

The following brief list by telegraph, for Sept. 8, will appear more complete on receipt of mail advices:

California.—Ulrich Bachman, San Francisco, bottling apparatus; Michael Barthel, San Jose, an extensor; George Biddell, Woodland, self-heating mechanism; Frank A. Brooks, San Francisco, arm rests; John Driver, San Leandro, vehicle; Milton Hall, San Francisco, wall protector and fender; James K. Kendrick, Germantown, plane; William B. O'Connor, Stockton, odorless gas stove; Lewis I. Thompson, Mukluine Hill, obstetrical device; Washington—William H. Garlock, Seattle, car coupling; Asia Mosier, Buckley, foot support for wood choppers.

Nova.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast Inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

VARIABLE NOZZLE.—A. A. Charonnat, Nevada City, Nevada Co. No. 458,762. Dated Sept. 1, 1891. The object of this invention is to provide a simple and effective nozzle, the discharge of which can be varied and regulated by means of a regulating plate so constructed and arranged as to be perfectly balanced to permit the ready and easy operation. The invention consists of a nozzle having fitted to its end a transverse hollow seat, in which is adapted to be reciprocated a plate formed with a succession of apertures of varying diameters, said plate having a stem on each end passing through stuffing boxes whereby it is moved to bring any of its apertures into alignment with the nozzle, or to bring a solid portion opposite thereto to serve as a gate. When it is desired to change the capacity of the nozzle to a greater or less degree, the regulating plate is moved to one side or the other in order to bring the proper aperture into alignment with the nozzle passage. The regulating plate being balanced, little power is needed to move it one way or the other.

PILLOW-SHAM HOLOER.—Wm. T. Rutherford and A. J. Roberson, Napa, assignors of one-third to D. H. Switzer. No. 458,758. Dated Sept. 1, 1891. The invention consists in the novel construction and arrangement of the hook-bar which supports the pillow-sham, and the means for operating and controlling said bar to raise the sham and to hold it down.

LUMBER CLAMP.—Wm. A. Madden, Madera, Fresno Co. No. 458,763. Dated Sept. 1, 1891. The object of this clamp is to bind together bunches of lumber to be sent in compact masses down a flume. The clamp can be readily adjusted and tightened to place on the end of the bunch, and will avoid any necessity of using wedges commonly employed to spread the lumber to tighten the bunch in the clamp. A further object is to provide a connection between the adjacent bunches of such a character as to permit each bunch to turn freely to its riding side without cramping or danger of loosening the clamps, and which will hold each bunch

in place and not permit any riding over and consequent jamming in the rapid of the flume. The hooks, being swiveled, permit each bunch to turn freely to its riding side, and the connection between them is too short to permit any bunch to ride over the end of another.

SAFETY DEVICE FOR ELEVATORS.—E. F. Moening and K. A. W. Haeseler, S. F. No. 458,765. Dated Sept. 1, 1891. This novel safety attachment for elevator cages consists in the combination, with the cage and the vertical guides of supplemental vertical bars fitting in grooves in the outer faces of the guide timbers, said vertical bars being connected at top and bottom with angularly-disposed levers, by the action of which they are drawn toward the center or forced outward. It further consists in connection with these levers of the suspending link, springs acting upon the levers when the link is released by breakage and cushion springs upon which the elevator cage is received when the safety attachment is thrown into action.

TUG HOOK.—John H. Boothe, Hollister, San Benito Co. No. 458,761. Dated Sept. 1, 1891. The invention relates to the general class of tug hooks and especially to those which are adapted for what is known as "short-tug harness," or "butt-chain" harness. The object of the invention is to provide a hook which can readily and effectively engage the chain connection with the whiffletree, but which has its point so guarded and protected that it cannot by any accident cut or injure the horses. The construction is such that the tongue of the hook is not apt to be opened by any accidental cause.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Sept. 10, 1891. Business the past week was largely interrupted by two holidays. The feeling in all branches of trade continues to prevail that we are entering an exceedingly prosperous season. Taking manufacturers as a whole, and more is doing with them than for all of three years past. This not only covers this city, but extends to other trade centers and manufacturing points on this coast. The money market is generally easy, notwithstanding the efforts of a few moneyed speculators to tighten it so as to buy speculative articles or securities at low prices to sell out at higher prices when their artificial closeness disappears.

QUICKSILVER.—Receipts the past week aggregated 264 flasks. The market is stronger at a slight advance. Sales are reported at a slight advance on our quotations.

MEXICAN DOLLARS.—The market is fairly steady around 77½ cts. The shipments to China continue quite free.

SILVER.—The market both at home and abroad is strong at a slight advance. Private telegrams received to-day from New York quote that market at 98½ cts. In this city the Mint is paying 98½ cts., but even at this figure many holders are not disposed to sell. Our advices from the Comstock mines are very decided in this statement that all encouraging work is being done toward the West, where it is known a gold-bearing lode exists. While the news does not warrant the belief that a bonanza will be found, yet it is rich in gold, but generally narrow. This work is accepted as proof positive that the managers of the above mines have seemingly given up the futile hunt after large silver bonanzas. With the Comstock mines gold producers instead of silver, the latter's market value ought to improve outside of all other considerations. The shipment of silver bullion from England to India ought to be made soon more freely.

BORAX.—The market is essentially unchanged, with a fairly firm tone reported.

LIME.—Receipts the past week aggregated 1404 bbls. The demand is only fair. The Hawaiian islands do not appear to be drawing their usual quota.

ANTIMONY.—The market continues to rule in buyers' favor, in sympathy with lower prices at the East.

IRON.—Imports the past week aggregated 100 tons from New York. While the market is not reported stronger, yet there appears to be a better tone. Stocks are being lowered, but while this is the case with spot supplies, still there are free consignments on the way. At the East there is a growing belief that the railroads will soon be in the market for rails, which, if proven correct, ought to bring about better prices for pig.

LEAD.—There is nothing new to offer. Prices for both pig and the manufactured products are unchanged.

COPPER.—At the East and also abroad there appears to be more pronounced symptoms of still better prices later on, but of course this depends quite largely on the output of American mines.

COKE.—Imports the past week aggregated 500 tons from Swansea. The market is fairly steady under a free consumption.

COAL.—Imports the past week aggregated as follows: 1500 tons, Departure Bay; 4300, Comox; 3757, Liverpool; 2456, Swansea; 2411, Seattle; 300, New York; 2620, Newcastle, N. S. W.; 4540, Sydney; 1100, Port Townsend; 756, Nanaimo; 23,734 tons. The market is reported still easier, notwithstanding the very large consumption. Increasing shipments on the way combined with heavier outputs of the coast mines are against sellers. The following is the tonnage on the way from Australian ports: To San Francisco from Newcastle, N. S. W., 64,314 tons register; from Sydney, 13,797 tons; total, 80,111 tons. To San Diego from Newcastle, N. S. W., 16,076 tons register. Grand total, 96,187 tons register, equivalent to about 150,000 tons carrying capacity.

Mining Share Market.

A partial holiday on Monday and a legal holiday yesterday (Wednesday) interfered, to some extent, with the mining share market. On Friday the Comstocks, under the leadership of Savage, developed considerable strength, which was maintained up to and including Monday. On Tuesday shares closed lower, chiefly under cross-order sales. It is needless to say that the improvement in prices on Sat-

urday brought out increased numbers of "minnows," and with their appearance, so as not to lose stock, the pool began to sell off bear stocks. Prices now quoted for stock are altogether too low for the pool to peddle them out, when it is considered that the mines are in better condition than ever before and all interests working in harmony. While the writer believes in very much better prices before many months pass, yet it is best to state that the market is apt to see several breaks of from 40 to 60 per cent, probably on assessments or some other scare, with innumerable 10 to 20 per cent setbacks. People quick enough to get these turns will make considerable money, but there are those who buy, pay for the stock, and do not attempt turns, well knowing that very few, if any, can come out winner in the end. In considering the future of the share market, it is well to keep in mind the simple fact that it has been three or more years since this country has had a speculative craze, and consequently the people are ripe for some such excitement. The first move this year in a speculative way was that in wheat, based on the world's statistical position; following on its heels is a speculation in railroad securities, and it is safe to say that the mining share pool will not be slow in fostering a speculation in their holdings.

The difficulty heretofore appears to have been, that outside holders on every substantial advance in prices came in as sellers instead of buyers, and to maintain a deal under such a condition, it would require unlimited capital. With a speculation craze in other securities, it takes very little to promote a big boom in mining shares, and that, too, without showing up much ore. The savings banks in this city give unmistakable evidence that money is in oversupply, and when this is the case, persons having these holdings can be easily brought into the arena as speculators, by allowing some of the more talkative "gudgeons" to make money by trading in shares.

The position taken by the MINING AND SCIENTIFIC PRESS, that there was a distinct and separate west lode, is being accepted by the local press at Virginia. In substantiation of this, we give the following from Tuesday's Enterprise: "Sierra Nevada people have demonstrated beyond all doubt that the syenite footwall of the Comstock is not the limit of ore on the west. After passing through a syenite casing 700 feet thick on the west, the crosscut went through 18 feet of clay and quartz, and then entered as likely a vein formation of quartz and porphyry, which it penetrated for 70 feet, as can be found anywhere. The rock that the crosscut is now penetrating yields assays in gold and silver, and there can be no question but that it is a separate and distinct ledge formation, the value of which time, money and muscle will reveal."

It is reported that a leading Comstock magnate gave a lady friend a tip on Potosi and Bullion when the prices were considerably higher than now, promising to sustain all losses, if there were any. This reminds the writer that a leading citizen of Oakland, who is said to be a particular friend of certain mining magnates, was first put into the Tuscarora stocks, on the same condition. The shares at the time were selling at dollars. All friends of this gentleman who bought on the "tip" were heavy losers, for the price of the shares went down to cents with assessments added.

We are informed that arrangements are being made for the delivery of one or more lectures under the auspices of the Mining Stock Association, for the purpose of showing up the peculiar methods in vogue in mining ore on the Comstock. The lecture will be embellished by stereoscopic illustrations from scenes taken on the spot.

Con. Virginia passed its dividend to-day. In the suit of M. W. Fox vs. Savage Mining Co., Judge Sanderson's decision is accepted as favorable to Mr. Fox. Now as he claims 19½ feet of the 600 feet of the Savage mine, he can come in as a cotenant, and either jointly or separately work his portion. More interesting developments can be looked for later on.

Mining shares opened dull and heavy this morning, which causes outside operators to look on in wonderment as to what will be the next move.

The news from the Comstock mines continues very encouraging, for although the pool is getting, so to speak, deaf, dumb and blind yet some news does leak out. The work in Con. Virginia is closely watched, as is that going on in all the North End mines. In the former, as the north drifts are being run on the 1100 and 1800 feet level, there ought to be more active times in that stock. In Best and Belcher, Gould and Curry, and also in Savage, the work gains in importance as it progresses, the only trouble is that the work in the mines may be stopped just when it should not. In the Gold Hill mines, private advices report encouraging news. If the mines were differently managed, so as to inspire confidence in the public, the present showing would cause considerably higher prices to obtain.

Mining Companies' Financial Standing.

The following is the financial standing on the first Monday of the present month of the mining companies listed on the two exchanges in this city:

ARIZONA MINES.		Dr.	Cr.
Crocker.....	Dr. Or. Gould & Curry.....	\$16,580	
Locomotor.....	\$1,521 Hale & Norcross.....	839,896	279
Peeries.....	3,153 Justice.....	4,9	8
Silver King.....	1,682 Kentucky.....	7,137	
Wells.....	402 Lady Washington.....	13,481	310
BOIE MINES.			
Bodie.....	Merced.....	16,835	
Bulwer.....	6,406 Ophir.....	20,126	
Monie.....	6,873 Overman.....	26,659	
Standard.....	2,624 Potosi.....	7,656	
Syndicate.....	25,638 Savage.....	7,370	
COMSTOCK MINES.			
Alpha.....	7,522 Seg. Belcher.....	785	
Atlas.....	Geo. pion.....	4,037	
Belcher.....	11,899 Sierra Nevada.....	13,011	
Bullion.....	2,348 Silver Hill.....	11,740	
Caledonia.....	18,059 Utah.....	3,889	
Challenge.....	23,078 TUSCARORA MINES.		
Chollar.....	76,941 Belle Isle.....	3,315	
Confidence.....	19,747 Comstock.....	12,221

	13,517 73 North Belle Isle.....	33,216	
	5,332 N. Comstock.....	4,401	
	11,638 MISCELLANEOUS MINES		
	22,404 Eureka.....	43,943	
	1,337 Holmes.....	40,794	

Crown Point has \$1490 due on assessment. Holmes has unpaid bullion amounting to \$7000 ounces. Occidental has unpaid bullion amounting to \$10,419.97. Con. Cal. & Va. has unpaid bullion amounting to \$88,551.50 and further shipments to arrive. Navajo has \$12,800 due on pumping account.

MECHANICAL PROGRESS.

Insolubility of Pure Metals in Acids.

The results of an investigation concerning the cause of the insolubility of pure metals in acids are contributed by Dr. Weeren to the current number of the *Berichte. De la Rive*, so long ago as the year 1830, pointed out that chemically pure zinc is almost perfectly insoluble in dilute sulphuric acid. Dr. Weeren's theory of the phenomenon is as follows: "Chemically pure zinc, and also many other metals in a state of purity, are insoluble or only very slightly soluble in acids, because, at the moment of their introduction into the acid, they become surrounded by an atmosphere of condensed hydrogen, which, under normal circumstances effectually protects the metal from further attack on the part of the acid." The experiments from which this theory has been derived were briefly as follows: The amount of chemically pure zinc dissolved by the acid was first determined. It was next sought to determine what difference would be effected by performing the experiment *in vacuo*, when of course the escape of the hydrogen would be greatly facilitated. The solubility was found under these circumstances to be increased sevenfold. Next, the experiment was performed at the boiling temperature of the dilute acid, first when ebullition was prevented by increasing the pressure, and secondly when ebullition was unhindered. In the first case, when ebullition was prevented, the solubility was practically the same as in the cold; while in the second case, with uninterrupted ebullition, the solubility was increased 24 times. Finally, experiments were made to ascertain the effect of introducing into the acid a small quantity of an oxidizing agent capable of converting the hydrogen film to water. When a little chromic acid was thus introduced the solubility was increased 175 times, and when hydrogen peroxide was employed the solubility was increased three hundredfold. The explanation of the ease with which the metal becomes attacked when the ordinary impurities are present, is that the hydrogen is not then liberated upon the surface of the zinc, but rather upon the more electro-negative impurities, leaving the pure zinc itself open to the continued attack of the acid.

The Sand Blast.

It is a strange matter that notwithstanding our boasted progress, the sand blast has made but little progress in this country. The Tilghman Sand Blast Company at Sheffield, England, uses at least 200 horse power of steam in its operations, and the application elsewhere in Europe is extensive, but in the United States, for some reason, people have not availed themselves of it as they might have done for various purposes. The main operation carried on at Sheffield is that of recutting files—not recutting old files, although some of that is done, too, but recutting new files, to improve them; and here comes in another important discovery in this process.

The Sand Blast for Sharpening Files.

At some place in New England where a sand-blast machine was employed, an attempt was made to clean a dirty file by holding it in the jet. The file was of course cleaned at once, but the effect was something more. The file, although a worn one, had all the characteristics of a new one, which, as all mechanics know, is a very noticeable change. Other files were treated in the same manner, with a similar result, and the discoverer proceeded to patent the process in this country, assigning the invention to Messrs. Tilghman for European countries.

Then began another round of experiments to determine the precise nature of the effect produced. The experiments extended to giving a certain number of uniform strokes with files and weighing the metal cut away. New files and old ones were treated, until the precise nature of the effect was learned.

Every one knows how files are cut with chisels that raise up shavings or teeth. These are of curved form and with a thin edge that soon crumbles or breaks, unless the cutting is skillfully done and the steel of good quality. When treated by the sand blast, the files are held at an angle, so the sand impinges on the back of the teeth, cutting away the thin edge, but not affecting the face, so the teeth become strong cutters, without the thin curled edge left by the chisels in cutting. The operation is very rapid, requiring but a few seconds, and the value of the files is much increased, so much so that a great many of the files made in Sheffield and on the Continent are treated in this manner. Sand, in the common sense, is not used in this process, but a mixture of sandy clay and water, thin enough to be circulated by pumps. This mixture of clay-water, it may be called, is drawn in by induction nozzles and discharged through a thin slit made in chilled cast-iron tips that wear away very rapidly.—*Engineering and Mining Journal.*

RIVETED JOINTS.—What value shall we give to the iron rivet when used in connection with steel or iron plates? To determine this question Mr. Allen, of the Hartford Steam Boiler Inspection and Insurance Co., made use of the Emery testing machine at the U. S. Arsenal at Watertown. The experiments were made with American iron and steel, and hence will be

valuable in practical work in this country. In a series of five experiments with steel plates and iron rivets, holes punched, the shearing resistance per square inch was as follows: 39,740 pounds, 38,190 pounds, 39,770 pounds, 35,638 pounds and 41,100 pounds. In view of these results, the lecturer assumes that 38,000 pounds per square inch is a safe estimate of the single shearing resistance of iron rivets in steel plates. Assuming 38,000 pounds as the safe estimate, we must decide upon the thickness of plate, diameter of rivet hole, and pitch of rivets. In deciding upon these elements in the problem, we must so adjust the size and pitch of rivets as to make the shearing resistance of the rivets as near the strength of net section of plate as possible. By a series of computations too lengthy to be here given, Mr. Allen shows the efficiency of a single riveted joint to be 56.6 per cent and 63.3 per cent to be the efficiency of a double riveted joint, while the efficiency of a triple riveted joint is 75 per cent.

A RAPID ANNEALING FURNACE.—An annealing furnace having a very rapid action is announced as the outcome of the experience of Mr. G. Tomkinson, who for many years has been engaged in the designing and construction of such furnaces. It is applicable to sheet annealing, hollowware, malleable iron, sheet tin, or steel. In the case of sheet annealing the time is said to be reduced by 50 per cent, with other advantages. The furnace consists of four outer walls, within which, by the erection of two side walls and one end wall, is a second furnace or annealing oven. The flames and heated gases from the outer space pass through numerous perforations in the two side walls into the middle chamber, and after traveling through this space escape by bottom flues furnished with dampers to the chimney stack. Only one fire is used, and the pot containing the articles to be annealed is by this arrangement subjected to a uniformly distributed heat. Hence the pot does not suffer from undue strains or buckling, and lasts longer than usual. The uniform distribution of the heat also accounts for the shorter time occupied by the annealing, and likewise causes a reduced fuel consumption. We understand that several of these furnaces are in successful use in the Midlands.—*London Iron.*

FOUNDRY ACCIDENTS.—Too much care cannot be exercised in placing old iron in a furnace or in manipulating the molten metal while pouring. Quite a serious accident recently occurred in an Eastern foundry which a little care and forethought might have avoided. A solid piston head went into the cupola with other iron to be melted, and there was probably some water in it that created steam and exploded. The cupola was blown out, and one man injured a little, but not so as to prevent his keeping at work. The damage was not important. About the same time an accident of a similar nature occurred in another foundry near by. A cylinder head being melted, exploded on account of water contained in it, killing one man's face with clinders and blowing a hole through the shop roof. Ordinarily, a cylinder head does not go to the scrap heap until broken, and in any case is not supposed to be filled with water when screwed up. But sometimes water finds its way in through pores in the iron, so machinists say. Still another accident was noticed when a piston head, being repaired in a machine-shop, exploded. Too much care cannot be observed in handling hollow castings in either the foundry or machine-shop. Nothing of the kind should be allowed to go into a furnace or forge without being either broken or carefully examined.

MAGNOLIA METAL IN ROLL BEARINGS.—At the Blochain Works (near Glasgow) of the Steel Company of Scotland, Magnolia metal has recently been tried to obviate the trouble caused by heating of roll necks, and the rapid wear of the journals caused thereby, and it is stated, with entire success. In a trial by the Stockton (on Tees) Malleable Iron and Steel Co., on their 31-inch steel plate mill with phosphor-bronze bearings at one end of the rolls and Magnolia metal at the other, the former was worn out after 14 weeks, while the latter was scarcely worn at all. In this use of the metal, the Stockton Company says: "The bearing is cast first, and is of a special phosphor-bronze for bottom chilled plate roll necks and other bottom roll necks. After the bearing is cleaned and dressed in the ordinary way, a segment of loam core of proper radius is placed against the bearing, and the magnolia is then run into the recess provided for it. This is the very best kind of bearing for the heaviest possible work. Many other methods are suggested, but this is the cheapest and best. If the bearings were not of the best phosphor-bronze, the end thrust of the rolls would wear the collar away and cause the bearing to be changed when the magnolia face of the bearing was quite good and not at all worn away."

A NEW USE FOR RAMIE.—Steam pipes have recently been made of ramie fiber, hardened under tremendous hydraulic pressure, and possessing a tensile strength equal to 23 times that of steel. The ramie fiber, or China grass, has the property of being unaffected by moisture; it will not shrink nor swell, it is a non-conductor of heat, it cannot rust, and these features, together with its great strength, are all desirable in steam pipes, its utilization in this line being regarded, therefore, as one of the possibilities of the future.

A NEW WRINKLE IN WELDING.—A new welding method; invented by H. E. Fowler, New Haven, Conn., refers principally to lap-welds for joining the ends of band-saws, plates and bars, and the manufacture of water-pipes, boiler shells and the like. The process consists in first forming holes in one of the parts to be united so that, when the parts are heated and welded by any convenient means, a portion of the metal of the other part will be forced into said holes, strengthening the joint. In modifications, holes are formed in both the parts to be welded, and in some cases, these holes are made to coincide, and pins or rivets are inserted.

WORKING IN GROOVES.—There appears a decided tendency among mechanical men to work in grooves. When a certain end is sought in a piece of machinery half a dozen men will select perhaps as many different ways of attaining the end sought. One man plans his faith to toothed wheels, and will use them as spurs or helves to get almost any motion; another man works with pawls and ratchets, and a third with cranks. All this often arises from some particular bent of mind impressed, perhaps, by a special early training.

BUILDING A LOCOMOTIVE IN TWELVE HOURS. It is stated that the machinists in the shops of the Pennsylvania Railroad Company at Altoona are about to begin the difficult task of producing an improved locomotive of the mogul type in 12 hours, which, if done, will heat the highest record known by about three hours.

NEW STYLE OF DRIVING BELT.—A driving belt composed of a flexible woven or fibrous material, with an exterior of rubber, is the invention of a New Yorker. The coating is smooth and plain on the outer side, but on the inner or gripping surface it is formed into transverse parallel flutings.

SCIENTIFIC PROGRESS.

Motion by Electric Current.

A fine metal wire stretched between two supports, one of which is provided with a strainer or spring for regulating the tension, on being traversed by a continuous current, begins to vibrate.

The amplitude of the vibrations, which is at first very small, increases as the time goes on, and quickly arrives at a maximum, which it maintains as long as the current is passing through, provided that the surrounding atmosphere remains in the same condition, or, at any rate, does not undergo any sudden change. The vibrations may thus continue indefinitely; they stop in a few seconds when the current is interrupted.

For a given tension, the amplitude of the vibrations seems to depend (according to the experiments which I have made up to the present) on the difference in the temperature of the wire and of the surrounding atmosphere. Now as it is the intensity of the current which produces this difference of temperature in a given wire, the amplitudes should vary according to the intensity.

The explanation of this fact seems to me to lie in the interchange of heat between the wire and the surrounding atmosphere; this constitutes really a *thermic motor*, in which the energy expended is supplied by the current, and the principle of the conservation of energy can be applied to it.

Any cause producing a change, in any manner whatever, in the mode in which this interchange of heat takes place will modify the phenomenon in some way or other. We can foresee that the finer the wire, the more rapid will the vibrations be; this is confirmed by experiment. I repeated the experiment with wires of different natures, and found that the phenomenon always preserves the same character. If we put the wire in a large glass tube, the movement is regular, because the wire is sheltered from the movements of the air. Occluding the two ends of the tube, I observed no change in the rapidity of the vibrations.—*Cor. Scientific American.*

SCIENTIFIC AND PRACTICAL KNOWLEDGE.—All knowledge is comprised in two classes. The first is that effect of mind which is the result of curiosity, that species of human instinct which prompts us to inquire the reason for everything we see, every action which takes place among others, among all living beings, among the elements, and among the celestial bodies. Mankind being endowed with reason, the next impulse is to apply the knowledge so gained to some useful purpose, to produce some benefit to ourselves. The first of these two classes is called "scientific investigation," the second is called "applied science." For instance, we notice for the first time a light from which smoke arises; we investigate, we perceive heat, and that it produces a disagreeable sensation. These are the first scientific facts; we apply the knowledge so gained by resolving never to touch fire. This is applied science. We have employed curiosity to find out the facts. We now employ caution to guard ourselves against damage, and we determine never to touch fire. All knowledge so gained is by this process; we may be told a thousand times that fire will burn, but we feel that that is only a theory; we want facts, and we obtain them by a course of scientific investigation. We use these facts and thus gain experience, knowl-

edge, at first scientific, next practical; and these two conditions make up the sum of all knowledge. Science is the foundation, practice the superstructure.—*H. Z.*

VOLATILIZATION OF IRON.—Quite recently Messrs. Mond & Quincke discovered that nickel combines with carbon monoxide to form a nickel-carbon oxide, which promises to be useful in connection with the development of nickel plating, says the *Scientific American*. At that time the experimentalists failed to obtain any similar compound of carbon monoxide with another metal. Considering it strange that nickel should be the only metal capable of entering into combination with this particular gas, they persisted in their investigation, more especially with iron, under very varied conditions, and they have at last succeeded in demonstrating the fact that iron is volatilizable, although apparently in very small quantities, in a current of carbonic oxide. This result was communicated to the Chemical Society, and the particulars of Messrs. Mond & Quincke's experiments are reported in the journal of the society. Suffice it to note here that they volatilized some finely divided iron in a current of carbonic oxide at ordinary temperatures; the deposits from this process giving all the known reactions of iron in remarkably brilliant colors. The practical importance of this discovery may or may not be considerable, as further research will be needed to establish the conditions under which the action can take place.

AIR AS FUEL.—An explanation of the process is as follows: Air is mixed with coal gas, as every one knows, and with hydrocarbon vapors, and the compound when burned generates a much greater heat than if the air were absent. So, too, a powerful air blast is a great economizer in smelting and reducing ores. But the new fuel is the air itself, which as a powerful blast is directed upon an incandescent substance, say coal made white hot, pure carbon or any other materials that can be made to glow. Coal, hydrocarbons or what may be employed to give the initial incandescence, but once the blast strikes the luminous body, the utmost intensity of heat is secured apparently by the combustion of the air, and may be maintained for an indefinite period by merely pressing the incandescence of the surface, and this may be done by a slight manipulation of the surface brought to incandescence, and with some slight renewal of carbonaceous material.

METALLIC IRON IN PLACE.—Mr. Daubree, a French scientist, received recently some curious specimens of metallic iron, found at a depth of several yards in the auriferous deposits at Priskavny, near Berezowsk, in the Urals. Analysis points to the presence in the metal of a very slight quantity of platinum, with no trace of nickel. The iron is, therefore, of terrestrial origin, and cannot be attributed to a meteoric fall. On the other hand, it shows an extremely remarkable leaved and figured structure, which can only be interpreted by supposing that, during its passage toward the surface of the earth, it has been subjected to intense mechanical actions, comparable, for instance, to those which develop the explosive gases generated by the ignition of gun cotton or dynamite.—*Iron.*

GLASS CUTTING.—Experiments have shown that instead of cutting out glass file fashion, a diamond works in another way. The parting of the glass is due to the forcing of the particles apart, as the orack when once begun may easily be made through the glass by a very light force. According to measurements which have been made, the superficial cut or orack need be but 1-200 part of an inch deep. Quartz and other articles of a like nature will cut glass as readily as a diamond, but being softer are not of so much value, as they do not retain the sharp edge necessary for the successful operation.

The first electric road designated to carry United States mails, has just been put in operation between the near by cities of St. Paul and Minneapolis. The cars are running regularly. The mail cars are designated from the other cars on the road by flying a U. S. flag and carrying mail boxes, properly fixed, for receiving letters at every stopping. The initiation and the success of the system is made a matter of much congratulation by the denizens of the twin cities.

THE MAGIC LANTERN AT SEA.—There are hopes of introducing the magic lantern as a means of signaling at sea. When so used the lantern will be called the "Ludograph." It will have slides in the shape of stenoid plates, each with a letter or figure cut in it. The screen is a flag stretched in a conspicuous part of the ship, on which the letter of the slide is projected. By the help of glasses the distant ship reads the letters.

SNOW WATER.—It was long thought that the water from melted snow was the purest of all. This idea has been proven incorrect, as the reverse is the case. Snow is really a purifier of the atmosphere, attracting from it, as it falls, various impurities, and these are found in the snow-water.

SOME EXPERIMENTS relative to the utilization of carbonic acid gas produced in the fermentation of sugar which have been made at the St. James Gate (Guinness) Brewery at Dublin are giving much satisfaction.

ELECTRICITY.

Electrical Car Propulsion.

There is a growing idea among the people at large, that the electric motor is soon to supplant the steam locomotive as a traction agent on ordinary railways. Nearly all electrical engineers feel quite sure of such a result; but steam men and mechanical engineers, outside of electrical circles, while they admit the possibility of such a result, are quite decided in their opinion to the contrary.

Experience thus far, however, shows quite conclusively, that electric traction is an economic success on street railways and suburban service, where traffic is concentrated and cars must be run frequently and on short routes. But it is held by doubters, that when rapid transit, heavy trains and particularly heavy traffic is required, electricity is, and ever will be entirely out of the question. Still it is acknowledged by all, in view of the wonderful progress already made in this direction, that it would be foolish to say that electricity may not, at some early day in the future, be able to supersede steam on every class of railway traffic.

Relative Cost of Electricity and Horses on Street Railways.

The West End Railway, which operates 260 miles of street railway in and near Boston, 60 by electric motors and 200 by horses, made the following report for June last:—The cost of operating the electric cars averaged 20.37 per cent per mile. The operating expenses of the horse cars during the same time averaged 24.58 cents per car mile. A still greater difference was shown in the earnings, which averaged 42.71 cents per mile for electric cars, and 36.85 cents per mile for the horse cars. This left net earnings per car mile of 22.34 cents for the electric cars, and 12.27 cents for the horse cars. The total mileage of electric cars during the month was 360,568 miles; and the total horse car mileage was 1,073,217 miles.

For the three months ending June 30, the percentage of operating expenses to gross earnings was 56.23 per cent for the horse cars, and 72.7 per cent for the electric cars.

These expenses do not, of course, include the interest on the cost of the two sections of the road and their respective plants of electricity or horse power; but it does include the cost of keeping up the electric power, and of feeding and caring for the horses. The first cost of the electric power exceeds that of horses; but the wear and tear of the former is undoubtedly less than that of the latter, and the net profit in the long run must be greatly in favor of electricity.

A Comparison with Steam Traffic.

The Engineering News of New York institutes a comparison between the earnings of the Boston West End Road and 15 of the leading passenger railroads of the country; also between that road and the general average of all the railroads in the Union, which we reproduce as follows:

PER CAR MILE OR PASSENGER TRAIN MILE.	Ave. earnings.	Ave. operating expenses.
West End Ry., June, '91:		
Electric Cars.....	\$0.4271	\$0.2037
Horse Cars.....	0.3685	0.2458
All Rys. of U. S., year ending June 30, '89.....	1.0628	0.5743
Boston, Winthrop & Shore.....	0.5411	0.1876
Cairo, Vincennes & Chicago.....	0.6255	0.2053
Cent. R. R. and Bank Co. of Cal.....	0.8812	0.3765
Cleveland & Canton.....	0.5147	0.2500
Dayton, Fort Wayne & Chic.....	0.3811	0.2721
Del. & Hud. Canal Co.....	1.6353	0.4253
Del., Lack. & W.....	0.9775	0.3009
Current River.....	0.9743	0.1803
Kan. Cy. & Pacific.....	0.2224	0.0732
Ohio River R. R.....	0.5568	0.2130
Pennsylvania R. R.....	1.3051	0.6414
Pennsylvania Co.....	1.0128	0.4177
Pittsburgh, Marion & Chicago.....	0.4574	0.0958
Talladega & Coosa Valley.....	0.3245	0.1569
Zanesville & Ohio River.....	0.5504	0.1560

Even when we take into full account the greater cost of equipping an electric road as compared with one operated by steam motors, the showing is not bad; and especially is it not when we further consider the immature and receding condition of electrical science as compared with that of steam. If we go back and review the progress made in the advance of direct steam as connected with railroading during the same length of time that it has been required to place electric propulsion in its present condition, we have abundant reason to hope for an early supplanting of steam by electricity. Electricity is as yet but in its very infancy, while steam is in the full age of its maturity. We can hope for no material advance in the economy of steam traction, while almost every day witnesses important progress in the science of electricity in all its varied applications to industry.

Even as we write, we hear of a most important advance in the mode of transmitting the electric current, and one which bids fair to work quite a revolution in transmitting electric power over long distances. The experiments are being made in France.

THE FIRST ELECTRIC TRACTION PATENT—As an interesting contribution to the history of electric power transmission and electric traction, the *Moniteur Industriel* cites the fact that on Jan. 16, 1855, Henry Gilhe was granted a patent "for the employment of two magneto-electric machines united by wires, one of the machines being put in motion by any convenient power, and generating a current which causes rotation of the second machine." The

inventor, it would appear, foresaw also the establishment of a number of motors along the line of a conducting wire, taking power from it. The inventor was M. Bessolo, a business arrangement having been entered into by him with Mr. Gilhe for the purpose of commercially developing the patent. Possible applications of the latter were, at the time, pointed out to be the operation of machine tools, and electric traction with underground or overhead conductors, or with the rails serving as conductors. It would appear from this that all systems of electric traction have thus been antedated by Bessolo's early patent of 1855.

The Alameda Electric Railway.

The proposed Alameda Electric Railway, for which a franchise has been applied, will, when completed, constitute one of the most important enterprises of that description in the country. The road will pass through quite a number of towns on its way to San Jose. It will comprise about 40 miles of track, mostly in Alameda county, but about one-third in Santa Clara. The track will be a 42-inch gauge, the same as the Oakland, Hayward and Berkeley lines. The company thinks it wise that all the electric roads should adopt a uniform gauge. Such a course will no doubt prove of vast importance in the early future when all the principal valleys of the State will be threaded with such roads. It is expected that the road will cost about \$10,000 per mile. The cars will be similar to the narrow-gauge coaches, with motive power dummies which will be used as smoking cars, with a capacity of 20 persons each, while the cars will accommodate 40. Arrangements will soon be completed to commence construction works, which will be started at both ends at the same time.

It is the intention of the company, as soon as the road is in working order, to institute electric-light plants at all the principal points along the line—at Irvington, Alvarado, Oysterville, Mission San Jose, etc. The incandescent system will be employed.

As regards the electric motor system to be employed, that matter will be held in abeyance for the time. So rapid are the improvements being introduced in that direction that the company is desirous of utilizing the very latest improvements which may be announced previous to the time when such a decision must be made.

Local Electric Items

The triangular fight between the San Francisco and San Mateo Electric Railway Co. and the Market Street and Omnibus Railroad Companies, in regard to the control of a portion of Stanton street, is not yet over. The scene of hostilities was transferred from the street on the evening of the 4th instant to the supervisors' rooms in the new City Hall, where a wordy warfare came near resulting in one of blows. The electric company, however, had no hand in this contest, which was confined to the two cable companies. The only result that can be arrived at must be a compromise, by which all parties may be accommodated in the interest of public convenience.

The San Mateo and San Francisco electric railway will be completed, through Enreka valley, to the park in a few months. A tunnel at 18th street and Corbett road, to cost \$24,000, will be one of the most expensive engineering difficulties in the way of this construction; but it is rendered necessary to avoid hills which it will be difficult for electric cars to surmount.

One thousand and four hundred electric lights will be required to light the Doe building at Market, Hayes and Larkin streets. The Pacific Electrical Storage Company has the contract of wiring.

Col. C. F. Crocker is authority for saying that work on the Telegraph Avenue electric road of Oakland will soon be commenced. It is said that the rails have already been ordered. The work is an important one, and one of such magnitude that it has been necessary to devote much time and attention to details before commencing operations.

The Stockton Electric Company has made application for a franchise to construct an electric road from the Levee and Commerce street to Main, to Hunter, to Market, to East, and on Hunter from North to South streets. The company agrees to commence work within 60 days after the franchise is granted, and to complete two miles of the road within six months, and the rest within a year, and give the city \$60 a year for every car it runs.

The Los Angeles Board of Supervisors has received a petition for the right of way for a railroad from that city to Pasadena. The same request has also been made at Pasadena. The franchise is called for by Captain Cross, who built the first steam road between these two cities and afterward sold his road to the Santa Fe Company, by whom it is still operated.

An electric railway from Amador to Lone City is an enterprise which is fast taking shape. A preliminary survey has already been made.

An electric road has been projected over San Fernando street, Dolmas avenue and Second and John streets, San Jose. Jacob Rich has

petitioned for a franchise for the same, with a promise that work on the same shall be commenced within six months from date of charter.

The Capital City Railway of Salem, Oregon, has ordered two new cars from the Stockton works. The company has also ordered an 80-horse power dynamo to be used for power for the entire line. It will be sufficient to run sixteen cars. Improved reduction dynamos will be placed upon the cars.

Electric Lights.

A franchise has been granted to the National Electric Development Company by the Common Council of Salinas City, and a 300 light incandescent plant of their alternating transformer system will be at once installed at that place. Local capitalists will organize, incorporate and take the franchise.

Fremont will soon introduce electric lights. A company has already been incorporated, with a capital stock of \$100,000—\$79,000 of which has already been taken.

The mammoth high building, Masonic temple, of Chicago, will be lighted by one of the largest isolated plants in the world.

GOOD HEALTH.

Leucanthemum for Sour Stomach.

EDITORS PRESS:—In the issue of June 20, 1891, page 595, Good Health column, I note an article, "To Prevent Sour Stomach." Some years ago, I discovered that chewing and swallowing a leaf of the common Leucanthemum (*Leucanthemum Chrysanthemum* of Linnaeus, *Leucanthemum Vulgare*, Gray) would instantly relieve me of a "sour stomach," water breath or "heart burn." A sour taste in the mouth is at once changed by chewing a small fragment of a leaf.

For years I had been a sufferer from "sour stomach," and for relief, daily used from two to three teaspoonsful of bicarbonate of soda, but with only indifferent results.

One day I chanced to have an acid eructation when in a field away from my soda; I had just pulled from the ground a small spatulate-leaved plant that for the moment I thought to be *Leontodon* (the fall dandelion). I chewed and swallowed a small leaf of it, to see if its alkaloid would relieve me. I was surprised to find it was not bitter, but gave a flavor of water-cress, anise and licorice. I was no less surprised to find that the acid in the month, the pain in my throat and stomach, were entirely gone. I had pulled up a young seedling plant; twisting off the fibrous roots, I thrust the remaining leaves into my vest pocket, resolved to see what the result of eating a dry leaf would be; not doubting but that I would soon have another opportunity to try it. I subsequently found the plant, of which I had eaten, to be, as previously stated, *Leucanthemum Vulgare* of Gray, *L. Chrysanthemum* of Linnaeus. It was four days before another opportunity presented for testing the virtues of the plant for "sour stomach." I was riding, after eating a hearty midday meal (to which I was not accustomed), with a lady who is now in California, and one of your readers, and who is knowing to the above facts, when I had another acid rising. I took from my pocket one of the leaves mentioned above—then dry—and chewing, swallowed it; I was at once relieved from all unpleasant sensations, and found only the flavor of anise and licorice present. The lady had observed my movements and asked: "What did you put into your mouth then?" I answered: "A leaf of Leucanthemum." "Is that what you have been taking instead of soda?" said she. I replied: "I have taken only one leaf in four days, and have had no occasion for soda or another leaf till now."

"Well," said she, "give me a leaf; my dinner does not set well." I gave her one, which she quickly chewed and swallowed, and then exclaimed: "We must gather some of that, it is better than soda."

From that time I have gathered these leaves yearly, and always have them with me. To any of your readers who wish to test their virtues, and who will send an addressed and stamped envelope, I will return some of the dried leaves. Seeds and young plants can now be had for ten cents additional. I will gather and send either. Leucanthemum leaves seem to neutralize the acid ferments of the saliva, both in man and the herbivora.

I have been told that a farmer in Gorham, Me., used leucanthemum hay in the spring to correct the weakening effects of fresh grass on working oxen. A dairyman living in Medway, Mass., told me that, being short of hay one spring, he bought a rough lot that had been thought too poor for anything but hedging. It was mostly leucanthemum; the price was low, good hay was very scarce and high, but by a liberal use of shorts and cornmeal he thought he would be able to get his stock through the grass, but expected they would be in rather poor condition. To his surprise, this "poor leucanthemum hay" was eaten with a relish and without waste, and "the cows increased their flow of milk as though on fresh grass." The leaves that grow and crown the plant after flowering, when gathered, readily dry to a very brittle condition, and so remain here till spring, when they seem to gather moisture and become

tough, probably from the development of the mycelium of a microscopic fungus, a penicillium or puccinia, that, when fully developed, gives off clouds of spore dust on being disturbed.

To the question of Mr. Nelson Wade, Comptroller, Cal. (PACIFIC RURAL PRESS, July 4th, page 2), I would say: Leucanthemum would be good for bloated cattle.

Perspiration of the Human Body.

The statements in your paper are usually so correct that one can but read with surprise in issue of June 20, 1891, "Good Health" column, where you say:

"We lose about two pounds of water in 24 hours by perspiration." While some may lose as much as that in that way, more do not drink so much in that time, and a part of that which they do drink will leave the body by way of the kidneys. In the same article: "There are 27,000,000 pores on the surface of the body."

Divide that number by four, and then we would have a larger number than many physiologists concede. While no one has ever counted the pores of the whole body, portions of the skin have been examined with the microscope, and the number of pores to the square inch determined. The number varies from a minimum of 1500 on the back to a maximum of 3000 on the surfaces where they are most numerous; and this is for an average-sized human adult whose superficial area would be equal to that of a body six feet long and one foot in diameter, or nearly 20 square feet, or 2880 square inches, which gives by the maximum number of pores to the square inch, 8,640,000 as the total number; but the average number of pores to the square inch gives us only 6,450,000, and this is thought by many to be excessive. There is much misapprehension as to the real office of the pores in the skin. While they do relieve the body at times of some water, their normal function is to relieve the body of carbonic acid (CO₂) and possibly of carbon monoxide. When the elimination of these acid products of combustion by the skin is arrested by contraction of the surface capillaries, we have arterial tension and water is then forced through the skin—an exudation. There are many causes that tend to produce such a condition, such as mental states, atmospheric changes, and even excessive exposure to the sun's action, constrictions of the surface of the body, etc. The non-action of the skin is the prime cause of most diseases. Therefore keep the skin active.

G. F. WATERS

6 Somerset St. Boston, Mass.

ENGINEERING NOTES.

A PORTAGE ROUND THE DALLES.—According to the Portland papers, a proposition has been submitted to the Portland Chamber of Commerce by G. A. Lische, E. B. Dufur, T. H. Johnson and R. H. Norton, incorporators of the Dalles and Des Outes Portage Railway and Navigation Company, to build a portage railway around the obstruction in the Columbia river at the Dalles, the road to be constructed on the Oregon side of the river, and to be completed within six months from the date of the acceptance of the proposition, which is that the Chamber of Commerce take up \$250,000 of the first mortgage six per cent 50-year bonds of the company. In conjunction with the railroad a line of steamers will be put on navigable parts of the river, to connect with it. The company will guarantee a rate of freight charges on grain from any point on its system at least 30 per cent lower than any rate the Union Pacific Company may make, provided that company be not required to carry grain at less than one cent per ton per mile.

THE PIEDMONT SPRINGS WATER CO. is a new incorporation which has just come into being in Oakland. Some of the parties connected with this company have been engaged for some time in developing water in the hills back of Piedmont and the Silk Culture Station near there. Their efforts have resulted with most unexpected success, and the company has now been incorporated with a capital of \$300,000. The source of this water supply is several hundred feet above the highest point of the Piedmont cable road, and will furnish an abundant supply of water for all the region above and along the route of that road. The water is equal to the very best mountain supply, and is developed by tunnels running into the hills. No surface water enters into it. Mr. Dingee, on whose land the water is found, is one of Oakland's solid men, and the chief factor in the enterprise, which will prove of incalculable value to this, the most healthful of all the suburban localities which surround San Francisco.

A STEEL CANTILEVER BRIDGE is being built over the Spokane River, at Spokane, Wash., by the Spokane Bridge Co., of Toledo, O. The bridge has a canal height of 1135 feet, and consists of three cantilever spans, one 277 ft. four in., two 189 ft.; three steel truss spans, 105 ft., 90 ft. and 54 ft. long, respectively, and trestle approaches. The distance between centers of trusses is 30 ft., the roadway is 38 ft. 8 in., and there is an 8 ft. 8 in. sidewalk at each side. The roadway will carry double tracks for a street railway, and will be floor beams bolted together in pairs, except underneath the street-railway rails, where single 7x16 in. beams will be used. The bridge will be supported on iron trestle work piers.—*Pacific Lumberman.*

TABLE OF CONTENTS.

EDITORIALS.—The Pollok Gold-Extracting Process; Best's Gas Engine, 161. Passing Events; Necrology; Ozocerite in Oregon; Foundry Notes; Handy List of Mining Books; An Astronomical Society, 168. The Springer Furnace; Mining Magnesia, 169.

ILLUSTRATIONS.—Best's Improved Gas-Engines; The Pollok New Chlorinator and Filter Bed; Pollok Original Chlorinator and Precipitating Pan, 161. Springer Double Puddling Furnace with Reversing Flame, at Konigs-Marienhutte, 169.

CORRESPONDENCE.—Plumas County Mines; Magnesia Works in Napa County; The Band Saw, 162.

MISCELLANEOUS.—About Butte County Mines; The Oil Wells; Gravel Channels; Slakiyon Blue Gravel, 162. Prospecting; Wood River Mines; Revival of Mining in Calaveras; Rich Asphaltum Deposits; Gold and Silver Processes; New Incorporations; River Beds and Tunnels; Fine Gold in Placers; Shipments of Quicksilver; Broken Hills; Foreign Companies in California; A Rare Specimen, 163.

MECHANICAL PROGRESS.—Insolubility of Pure Metals in Acids; The Sand Blast; Rivet Joint; A Rapid Annealing Furnace; Foundry Accidents; Magnolia Metal in Roll Bearings; A New Use for Ramie; A New Wrinkle in Welding; Working in Grooves; Building a Locomotive in Twelve Hours; New Style of Driving Belt, 166.

SCIENTIFIC PROGRESS.—Motion by Electric Current; Scientific and Practical Knowledge; Volatilization of Iron; Air as Fuel; Metallic Iron in Place; Glass Cutting; Miscellaneous, 166.

ELECTRICITY.—Electrical Car Propulsion; The Alameda Electric Railway; Local Electric Items, 167.

GOOD HEALTH.—Leucanthemum for Sour Stomach, 167.

ENGINEERING NOTES.—A Portage Round the Dalles; The Piedmont Springs Water Company; A Steel Cantilever Bridge, 167.

MINING SUMMARY.—From the Various Counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 164-165.

MINING STOCK MARKET.—Sales in the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, etc., 172.

MARKET REPORTS.—Eastern and Local Metal Markets; Coal and Coke, etc., 172.

Passing Events.

Of two holidays this week, one was peculiar to California alone—the celebration of the anniversary of the admission of the State into the Union, the Pioneer Society and the Native Sons taking the lead in the celebration. Members of the latter organization went to Santa Cruz, where they had a procession, literary exercises and a general good time, representatives coming from the various counties of the State.

On Labor Day the various Trades Unions and labor organizations had a parade in the city, with succeeding literary exercises. A very good showing indeed was made by the men, the various trades being well represented.

Among the minor industries in the mineral field in this State is the new one of calcining magnesite to make magnesia, which is now being done in Napa county. The company operating there is furnishing the product for use in the manufacture of wood-pulp in Oregon and iron-making in California. Upward of 100 tons a month are being made.

The deaths are chronicled this week of several locally well-known workers in the field of mining, science, law and engineering.

The low stage of the waters in the rivers at this season is giving the river miners their harvest time. River-bed mining is not practiced to the extent it formerly was, but nevertheless there are many points where it is still carried on with more or less success.

Necrology.

U. S. Circuit Judge Lorenzo Sawyer died suddenly at his residence in this city on Monday evening. Judge Sawyer was best known to the mining community as the man who made the decision in the famous North Bloomfield debris case, the result of which was to stop hydraulic mining in this State. Many other cases of a similar nature, to enjoin the mines, have come before him, and although he was a miner himself for a brief time in 1850, in El Dorado county, his decisions were never favorable to the mining industry. Judge Sawyer was a pioneer of California and has held many positions of honor. He was City Attorney of San Francisco in 1853, and was appointed by Governor Stanford, Judge of the Twelfth District Court. In 1863 he was elected a Justice of the Supreme Court. In 1869 he was appointed Judge of the U. S. Circuit Court of the Ninth Circuit, embracing the Pacific States. This appointment was made by President Grant, and Judge Sawyer continued in the position from 1870 to the time of his death. He was 70 years of age and about to retire from the bench. Judge Sawyer was President of the Board of Trustees of the Leland Stanford Jr. University, having been connected with the trust from its formation.

P. A. Humbert, the well-known mining and civil engineer, died at Folsom on Sunday, where he was engaged in supervising the construction of the power house connected with the dam, which he also built. Mr. Humbert, a native of New York, was educated in Germany and graduated at the mining school in Freiberg. He came to California in 1876 and went to Virginia City, where he was employed as a mining engineer and as superintendent of the Ballion mine. Among other work done by him in this State was the designing and building of the jute-mill plant at San Quentin. This and the planning and constructing of the Folsom dam, canal and power house, has kept him out of mining engineering of late years. He was a nephew of August Humbert, the U. S. assayer of this city, who issued the first \$50 gold "slugs" coined in San Francisco in early days.

John A. Townsend, an old and respected citizen of Nevada county, died suddenly last week while at work in the Holbrook gravel mine at Randolph Flat. Death resulted from heart disease. Mr. Townsend was an old resident of Grass Valley and one of the best of miners. He was for several years foreman of the Empire and other mines of the district. He was a native of Pennsylvania, aged 64 years. Mr. Townsend used to work in the lead mines of Galena, Ill., before he came to California. When he came here in 1850 he went to work in the mines of Placer county. He was at one time superintendent of the St. Patrick mine, near Ophir, Placer Co., but most of his life in this State has been passed in the mining fields of Nevada county.

Dr. George Hewston, one of the best known of San Francisco physicians, died at his home in this city, on the 4th inst., of Bright's disease. He was 64 years of age. Dr. Hewston was for several years Secretary of the California Academy of Sciences, and for the past three years has served as second vice-president of that body. He was a prominent student of the subject of Zoophytes, and in this department made valuable additions to the Academy's collection. Dr. Hewston at one time had the largest and most valuable private library in this city, and was always an ardent book collector. He was a brother of General John Hewston, of the old assaying firm of Kellogg, Hewston & Co. Dr. Hewston was a graduate of the University of Pennsylvania, and was Demonstrator of Anatomy in the Philadelphia College of Medicine for a year. He was always one of the active workers in the Academy of Sciences here.

Peter Bargion, the inventor of the Bargion rail, died at his home in East Oakland last Saturday. The deceased was a well-known resident of Oakland, and acquired some distinction for being the inventor of the combination street rail that bears his name. The rail is in use on a section of the local road, and has proved a success wherever tested. The patent was sold to a syndicate.

THE Comstock mine pay-rolls last month aggregated \$196,781. The largest expense to one mine was the Con. Cal. and Virginia that paid for labor, \$36,311. The quartz mills paid out \$24,000.

Ozocerite in Oregon.

We were shown this week, by Mr. Melville Attwood, some specimens of a peculiar ozocerite from a recently discovered deposit in Southern Oregon. The mineral has a very different appearance from that found in Utah. It burns very freely, with a dense smoke but no odor. If the deposit is of any extent the discovery is an important one, since it is found in only one other locality in this country. The Utah ozocerites began to come into the market in 1888, and the deposit is now producing about 300,000 pounds a year.

This mineral wax or ozocerite in its refined form is used for nearly all the purposes to which ordinary beeswax is applicable. It possesses nearly all the properties of beeswax except stickiness, but in cases where that quality is desirable it is only necessary to wax the mineral with ordinary beeswax. Grade ozocerite, like other hydrocarbon compounds, is used to a considerable extent as an insulator for electrical wires. Ozocerite belongs to the series of hydrocarbon compounds which include marsh gas, petroleum and paraffin, it being very similar in appearance to the latter. It is colorless to white when pure. It occurs leek-green, yellow and brown.

This Oregon mineral wax is a yellowish white. Its specific gravity is very small, it being exceptionally light for its bulk. From appearance it is a purer article than that produced in Utah. Mr. Attwood has promised us the details of his examination when it is concluded.

We import large quantities of this material from Galicia, Austria, the amount, according to census reports in 1889, being 1,078,725 pounds valued at \$36.68. There are 35 companies at work in Galicia where they have been mining the substance since 1862. They had a monopoly in the product until 1888 when the Utah deposit began to be worked. If there is much of the substance in Oregon it will be worth attention as the demand for it is on the increase.

Foundry Notes.

It is noticeable to any one visiting the foundries and machine shops of this city that marine and electrical work at present "have the call," whereas formerly the bulk of the heavy work in the shops was in the mining line almost exclusively. More or less mining machinery is constantly being made, but nearly all the large mines within reasonable railroad distance from San Francisco are supplied, and repair work is about all we get, except in the case of new mines. The Great Northwest mine gets its supplies in this line from east of the Rockies, freight rates being more favorable from that direction.

In the building of cable and electric roads, however, the foundries of this city are called on for heavy machinery as well as smaller parts in quantities. The largest engines lately built here have been for an electric road. For electric lighting and power purposes, engines or water-wheels must be supplied, as well as dynamos and motors, and these plants necessarily give jobs of greater or less extent to our foundries. Many of the interior towns are now utilizing electricity for lighting purposes and the heavier engines for the dynamos are made in this city.

The largest jobs in our largest foundries are to a great extent connected with marine engineering. The steam coasting schooners which have so largely taken the place of the sailing vessel at our coast ports, bring to the foundries plenty of work. Those in commission have been very successful and those built lately have been of larger size. They need engines, boilers, propellers and all sorts of machine work upon them. Moreover, there is always more or less repair work on larger steamships visiting this port.

The ship-building interests of California are gradually enlarging from year to year, and this brings naturally an increase of marine work at our local shops. The class of work turned out is not excelled elsewhere and has always proven satisfactory to purchasers.

WYOMING MINING CONVENTION.—The second annual State Mining Convention opened at Cheyenne, Monday, with a good attendance and a great display. Each of the Wyoming counties sends coal oil, asbestos, gold, silver, copper and iron specimens.

Handy List of Mining Books.

Part 4 of "Handy Lists of Technical Literature" is a list of books on mines and mining, including assaying, metallurgy, minerals, mineralogy, geology, paleontology, etc. It is an alphabetical reference-catalogue, arranged under authors and subjects, and including analytical references to the contents of important works, compiled by H. E. Haferkorn. The list includes issues from 1880 to May, 1891, and a number of earlier books often met with in catalogues; also a short list of German works. For librarians, booksellers or technical workers this list is invaluable. It will be specially appreciated by those who have found it somewhat irksome, in searching for the literature of a particular subject, to look up successively the books under a long series of numbers, when frequently the author's name or the title of the work, if given as it is in these lists, is sufficient guide for eliminating works that are not wanted.

The compiler has taken unusual pains and spent an immense amount of labor in order to make this catalogue as complete as possible. Mining men and metallurgists in search of the literature of any special branch in which they are interested are here aided and guided, and can go to a library and find exactly what they want without losing time looking over books or general catalogues. In purchasing, the size and cost of book is indicated, and a separate key gives the names of publishers. The price of this "Handy List" is \$1.25, cloth-bound, with key to publishers; without key, \$1. We can procure the book at these prices for all who may order it.

The Astronomical Society.

The meeting of the Astronomical Society of the Pacific was held at the Lick Observatory on Sept. 5th. The Directors meeting was held from 5:30 to 6 o'clock the same day, and 25 new members were elected, as follows: Robt. S. Avery, Washington, D. C.; R. L. Bischoffheim, Paris, France; Mrs. E. E. Cook, Davenport, Ia.; A. L. Edwards, N. Y.; T. A. Hagerty, John P. Hely and K. Himrod, Chicago; Wm. Hoskins, Lagrange, Ill.; Mrs. M. M. Johnson, Circleville, Utah; Prof. J. H. Kedzie, Evanston, Ill.; Prof. Malcolm McNeill, Lake Forest, Ill.; Beverly K. Moore, Boston; Miss Pendleton, Phila.; Mrs. W. G. Preston, Boston; Miss M. J. Turner, Quincy, Mass.; Prof. J. M. Taylor, Seattle, Wash.; J. M. Van Slyke, Madison, Wis.; David Hughes, Mrs. Anna L. Hewes, Frank McMillen and D. O. M. Blake of San Francisco; F. H. Whitworth, Seattle, Wash.; Miss Mary E. Wilson, Oakland; J. Henry Turner, Woodville, Pa.

The membership of the society is now 420, of whom 44 are life members. This is the largest membership of any scientific society on the Pacific Coast.

At the meeting in the evening, when President W. M. Plerson presided, the Secretary announced that 38 presents had been received since the previous meeting, and the thanks of the society were voted to the donors.

The following papers were presented: Measurement of Jupiter's Satellites by interference methods, by Prof. Michelson, of Clark University, Mass.; Enlarged Drawings from the Moon-negatives of the Lick Observatory, by Prof. Weinek, Director of the Observatory of Prague; catalogues of the library of the Society, prepared by Otto Von Geldern; Observations of Jupiter and of his Satellites with the 36-inch equatorial of the Lick Observatory (1888-1890); the Observatory of the U. S. Military Academy at West Point, by Lieut. Harlow, in charge. The first named paper only, was read, by Prof. Campbell. After adjournment the members and their friends were given the use of the 12 and 36-inch equatorial and made the most of the superb night.

CALIFORNIA ELECTRICAL SOCIETY.—N. S. Keith delivered before the California Electrical Society last Monday evening his third lecture in a series on the "Evolution of the Arc Lamp." He described the first form of arc lamp used more than a century ago, illustrating his remarks with drawings showing the gradual improvement in this lamp down to its present state of perfection. In conclusion he compared the various arc lamps now in general use, showing the mysteries of their complicated construction.

In the PRESS of August 223 last were given engravings of the blast furnaces at Elschweiler and Horde, taken from Dr. Wedding's paper

on *c. f.* Fig. 1; Fig. 4 is a half-section on *a. b.* Fig. 1, and Fig. 3 is a section on *g. h.* Fig. 1. Dr. Wedding says that the essential improvements in puddling have not been in mechanical reblowing (though this has been done in

many), but rather in the more complete utilization of fuel, by means of gas-firing and double furnaces. Two furnace designs deserve special mention in this connection: that of Springer, with fixed hearth and reversible flame; and

to a very high temperature in the regenerators, passes from the puddling-hearth to the melting-hearth. The regenerators are in front of or under the furnace, as usual, and vertical or horizontal. This furnace may be used with di-

Fig. 1.

Fig. 2.

Fig. 4.

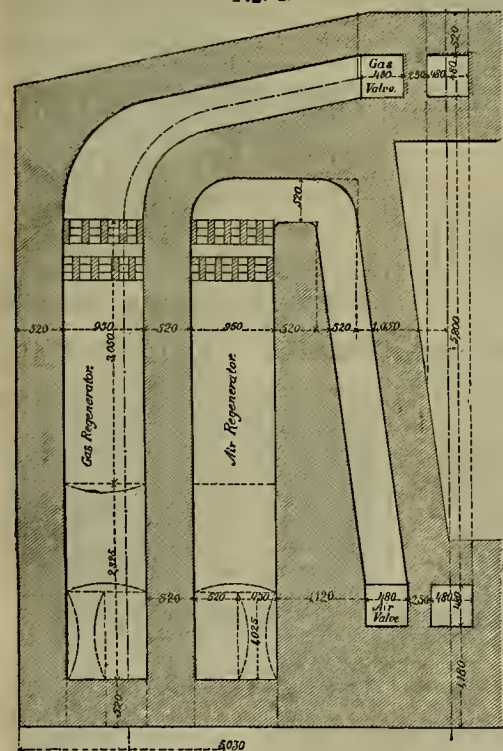

Fig. 3.

reot firing or with gas-firing, and is shown in the figures as constructed for gas-firing. It has done excellent work, even with lignite as a fuel. It has but a single disadvantage, namely, the dependence of the two hearths on one another; and this led to the invention of the Pietzka furnace (illustrated in the MINING AND SCIENTIFIC PRESS, August 8, 1891, page 89). While in operating the Springer furnace the flame is reversed only when the puddling in one hearth and the melting in the other are finished (or, in other words, must go in one direction as long as the puddling process lasts, even though by reason of any delay or prolongation of the process, the regenerators may be more or less cooled), this objection is obviated in the Pietzka furnace, where the flame maintains one

direction, yet the hottest flame always strikes the hearth in which puddling is going on.

Mining Magnesite.

In another column of the PRESS is a letter of a correspondent describing a mine in Napa county, where they are taking out magnesite and calcining it for the market. A sample of the mineral has been sent us by the owners of the mine. The magnesite is in the form of magnesite, and is hard, white and flinty. The component parts, according to Prof. Hanke's analysis, are about 43 per cent carbonic acid, 50 per cent magnesite and seven per cent silica, iron, lime and moisture. It occurs in ledges from two to six feet in thickness, apparently running deep, and extending upward of half a mile, as marked by heavy surface croppings. The rock is blasted out, as in a quarry, and broken to a size suitable for a furnace. The kiln is continuous, and has a capacity of five tons of calcined ore per day of 24 hours.

The owners of the mine have a contract with the Willamette Pulp & Paper Co. to deliver them 40 tons of calcined ore per month for two years, and delivery has been commenced. It is used at the company's works at Oregon City, Oregon, in the treatment of sulphite fiber in the manufacture of wood-pulp.

The Pacific Rolling Mills in this city also use the calcined rock as a flux in the furnaces. The Pacific Reduction Works of this city also use the best quality of the raw rock in their operations.

The output of the mine and kiln is now 125 tons of calcined ore per month. This will be reduced in the winter season and again increased next summer. The mine is $1\frac{1}{2}$ miles from the south end of Child's valley, 11 miles from Rutherford, Napa Co.

WATER is scarce for milling purposes on the
Carson river, Nev.

SPRINGER DOUBLE PUDDLING FURNACE WITH REVERSING FLAME, AT KONIGIN-MARIENHUTTE.

read before the American Institute of Mining Engineers. On this page, from the same source, we reproduce cuts of the Springer double puddling-furnace, with reversing flame. Fig. 1 is a section; Fig. 2 is a section the district of Saarbrücken and in Lorraine, without, however, changing the old construction, nor in the use of the rotary mechanical puddler (which, apart from a few small experiments, has never obtained a footing in Ger-

that of Pletzka, with constant direction of flame and reversible hearth. Springer's furnace has two hearths, placed end to end, one of which is charged with pig, as the iron begins to come to nature in the other. The flame, brought

Blinn's Tin, Sheet-Iron and Copper-Plate Worker.

A New, Revised and Enlarged Edition, from New Type, with New Engravings.

One of the Most Popular Technical Books ever published in the United States.

JUST READY.

A PRACTICAL WORKSHOP COMPANION

FOR

TIN, SHEET-IRON

—AND—

COPPER-PLATE WORKERS.

Containing rules for describing various kinds of Patterns used by Tin, Sheet-Iron and Copper-Plate Workers. Practical Geometry. Mensuration of Surfaces and Solids; Tables of the Weights and Strengths of Metals and other Materials; Tables of Areas and Circumferences of Circles; Composition of Metallic Alloys and Solders, with numerous valuable Receipts and Manipulations for every-day use in the workshop. By Leroy J. Blinn, Master Mechanic. A new, revised, and enlarged edition, printed from new types, and with 170 newly engraved illustrations.

In one volume, 12mo, 206 pages, price \$2.50, free of postage to any address in the world.

It having been found necessary to make a new set of electrotype plates and new engravings of this most popular book—the old ones having been worn out by actual use—it was determined to have the book re-edited and to add to it, in the different departments, new, recent and necessary matter. All of the old illustrations of patterns have been retained, and new ones have been added. The portion treating of metallic alloys and solders has been entirely rewritten, so as to have a more systematic arrangement, and to bring it abreast with the best modern practice in this interesting and important field. In all the other departments new matter has been added, every effort having been made to render the entire work, in the future, if possible, even more useful to the tin, sheet-iron and copper-plate worker than in the past.

ABSTRACT OF CONTENTS.

Rules for Describing Patterns; Practical Geometry; Mensuration of Surfaces; Mensuration of Solids, and Capacities of Bodies; Tables of Weights, etc.; Tables of the Circumference of Circles and of the Areas of Circles; Rules for Rendering the Tables Useful; Sizes of Tinware; Capacity of Cylinders, and various other Useful Tables and Information; Practical Receipts, Varnishes, Lacquer, Cements, Metallic Alloys, Miscellaneous Receipts, Strength of Materials, with Tables. Index.

The above or any of our Books sent by mail, free of postage, at the publication prices, to any address in the world.

A circular of 4 pages, quarto, giving the full Table of Contents of this popular book, will be sent free of postage to any one in any part of the world who will furnish his address.

Our New and Enlarged Catalogue of Practical and Scientific Books, 88 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free of postage to any one in any part of the world who will furnish us with his address.

Giant Powder Fuse Cap Fastener.

The instrument represented in the above cut is a new and little invention, being designed to save life and limb, and immaterially, by doing away with the dangerous operation of digging out wet and unexploded loads where Giant Powder is used in mining. The little instrument crimps the cap on to the end of the fuse firmly and absolutely water-tight. It is also used for cutting the fuse. They are neatly gotten-up of the finest cast steel, nickel plated. Price, 62 each, or the entire instrument fitted in gold plate, \$5. N. W. MOODY, Fresno, Cal.

PACIFIC ROLLING MILL CO.,

.....MANUFACTURERS OF.....

Cast Steel Castings and Steel Forgings

UP TO 20,000 LBS. WEIGHT.

True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.

GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.

—ALSO—

HOMOGENEOUS STEEL, SOFT and DUCTILE, SUPERIOR TO IRON FOR LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from 1/4 to 3 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shapes Steel to size and lengths STEEL RAILS from 12 to 45 pounds per yard. ALSO, Railroad and Merchant Iron, Rolled Beams, Angle, Channel, and T Iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

Orders will have prompt attention. Send for Catalogue. Address

ANNUAL MEETING.

THE REGULAR ANNUAL MEETING OF THE Stockholders of the Pacific Coast Borax Company will be held at the office of the Company, 320 Montgomery Street, Room 11, San Francisco, California, on MONDAY, September 21st, 1891, at the hour of 1:30 o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting.

EVERY one in need of information on the subject of advertising will do well to obtain a copy of "Book for Advertisers," 368 pages, price one dollar. Mailed, postage paid, on receipt of price. Contains a careful compilation from the American Newspaper Directory of all the best papers and class journals; gives the circulation rating of every one, and a good deal of information about rates and other matters pertaining to the business of advertising. Address ROWELL'S ADVERTISING BUREAU, 10 Spruce St., N. Y.

Assessment Notices.

GRAY EAGLE MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Placer County, California. Notice is hereby given, that at a meeting of the Board of Directors, held on the 12th day of August, 1891, an assessment, No. 25, of Five (5) Cents per share, was levied upon the Capital stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, Room 11, No. 303 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 14th day of September, 1891, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 8th day of October, 1891, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
A. W. BARROWS, Secretary.
Office, Room 11, No. 303 California Street, San Francisco, California.

ANNUAL MEETING.—THE REGULAR Annual Meeting of the Stockholders of the Inyo Marble Company will be held at the office of the Company, No. 137 Montgomery Street, San Francisco, California, on THURSDAY, the Tenth day of September, 1891, at the hour of one o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer books close on Monday, September 7th, at 2 o'clock P. M.

ROPER'S Practical Handy Books for Engineers & Firemen.

By STEPHEN ROPER, Engineer.

The Engineer's Handy Book, containing a full explanation of the Steam Engine Indicator, and its use and advantages to engineers and steam users, with formulae for estimating the power of all classes of Steam Engines. Price, \$3.50.

The Young Engineer's Own Book. Containing an explanation of the Principles and Theories on which the Steam Engine as a Prime Mover is based. Price, \$3.00.

Questions and Answers for Engineers. This little book contains all the questions that Engineers will be asked when undergoing an examination. Price, \$3.00.

Handbook of Modern Steam Fire Engines. The only book of the kind ever published. Price, \$3.50.

Catechism on High Pressure, or Non-Condensing Steam Engines. Price, \$2.00.

Care and Management of the Steam Boiler. Price, \$2.00.

Handbook of Land and Marine Engines. Price, \$3.50.

Handbook of the Locomotive. Price, \$2.50.

Use and Abuse of the Steam Boiler. Price, \$2.00.

Instructions and Suggestions for Engineers and Firemen. Price, \$2.00.

These books embrace all branches of Steam Engineering—Stationary, Locomotive, Fire and Marine. Any Engineer who wishes to be well informed in all the duties of his calling should provide himself with a full set.

- Three (3) Frue Concentrators.
- One (1) 10" x 18" Slide Valve Engine.

TULLOCK IMPROVED ORE CONCENTRATOR.

Patented Oct. 9, 1888, and Dec. 1890.

ANGELS, CALAVERAS COUNTY, Nov. 22, 1890.
JAMES TULLOCK, Esq.—Dear Sir: I am pleased to state that I have used two (2) of your Sulphuret Concentrators in the Gold Cliff Mill, since the first day of last May, and that they have given entire and splendid satisfaction, concentrating the sulphurets from 60 tons of ore every 24 hours. Your Sulphuret Concentrators are superior to any that I have seen, being simple in action, positive in effect, admirable in construction, of few mechanical parts, and admirably adapted to the concentration of any kind of sulphurets. I therefore cheerfully recommend them to the mining fraternity. Respectfully yours,
WOODSON GARRARD,
Supt. Gold Cliff Mine.

HELENA & IDAHO GOLD MINING CO., SUPERINTENDENT'S OFFICE, GIBBONSVILLE, IDAHO, Oct. 6, 1890.
Mr. JAMES TULLOCK, Angels, Cal.—Dear Sir: Mr. Arnold was saying the other day that you were talking something of coming up this way, and I have thought that perhaps you might be a little uneasy about your concentrators. You need have no anxiety about them whatever, as the one we set up is running all right and has not given a minute's trouble since starting, and the other one is all ready to start. They were so easy to set up and run that I forgot all about it. "Letter of instructions" until they were set up and running and you recalled to my mind your letter and instructions. Yours truly,
MYRON K. RODGERS, Supt.

ANGELS, CALAVERAS Co., Nov. 22, 1890.
JAMES TULLOCK, Esq.—Dear Sir: We have used two of your Sulphuret Concentrators in the Madison Mill, (10) ten stamps, for over six months last past, and I hereby testify that they have given every satisfaction, and in every sense fulfilled the great opinion I had formed of their superiority. They are easily handled, readily kept in order, require but little watching, are exceedingly simple in construction and absolutely positive in their work. In my opinion, they are superior to any other in the market, doing effective work in the treatment of large quantities of sands. Sincerely yours,
T. M. LANE, Supt. Madison Mine.

ANGELS CAMP, July 25, 1891.
Mr. JAMES TULLOCK—Dear Sir: We are working sulphurets from mines in Calaveras and Toulumuc Cos. We find the sulphurets saved on your machines cleaner than those saved on any other. Yours truly,
THOS. N. SMITH, Supt. Utica Chlorination Works.

Price, \$450.

For further particulars, address **JAMES TULLOCK, Angels, Cal.**, or
Risdon Iron and Locomotive Works,
Cor. Beale and Howard Sts., San Francisco.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Concentrating Belt manufactured in San Francisco, we can therefore fill all orders on short notice. The length and width of these belts are the same as is used on the Frue or Triumph Concentrating Machines, but can be made of any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffling also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth.

FRUE ORE CONCENTRATOR

OVER 3000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

PROTECTED BY PATENTS—September 2, 1879, April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

Price of Plain Belt Frue Vanner, \$575, f. o. b.

The Folsom Dam.

An Immense Water-Power Plant.

The immense masonry dam across the American river at the Folsom State Prison, which the Folsom Water Power Company has, with the aid of convict labor, been so many years erecting, is completed and we, in this issue, present to our readers a few engravings made direct from photographs, showing the massiveness of the structure and the heavy body of water which for many months of the year pours over its crest. There is no stronger structure of its kind than this in the United States. It is built on the solid granite bedrock of the river, and upward of 20,000 barrels of the best English cement was used in its construction. This dam is 89 feet high, 87 feet wide on the bottom and 24 feet wide on the top, and with the bulkheads on either end, measures upward of 650 feet in length. It contains 48,590 cubic yards of granite masonry, composed of granite blocks each many tons in weight. The front and back faces are laid up in courses with a rubble filling, composed of large rock laid in concrete between. For 185 feet in length, the center of the dam has been left six feet lower than the sides. Into this depression will be fitted a wooden movable dam or shutter, hinged to the top of the dam. This shutter will remain down, or flat, upon the top of the dam during most of the year, but during the short stage of low water in the fall will be raised by five hydraulic jacks set in the masonry, in order to make a storage reservoir six feet deep to save the flow of water in river during the hours of the night, and to provide a pond in which to float logs.

A heavy granite wall extends from the dam, forming the outer bank or line of the canal, for a distance of nearly a mile. The wall measures upward of 15,000 cubic yards. About 1200 feet below the dam, on the east side of the river, is located the Folsom State Prison. At this point the level of the canal drops about eight feet to afford to the State, in payment

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—*Eds.*

Nevada County Mines.

NUMBER 1.

[From Our Traveling Correspondent.]

Grass Valley.

Grass Valley is so well known as the leading gold mining section of the State that it is not necessary to prove the fact that her mines are the deepest, veins the most numerous, and ore values the highest of any gold quartz mining camp of California. At this time several of the large mines have run into a barren section, and until it is gone through the mines will not be on a dividend basis. This is an old experience in this camp, but as the mines have always come out all right, when the development is carried to a sufficient extent, the mine-owners no longer regard it as an indication that the mine has given out.

The Idaho.

The Idaho, of which Edwin Coleman is superintendent, still keeps up her dividends, as the last was \$3 a share. She may be said to be doing very well for a "worked out" mine that has produced close on to \$11,000,000. At this time the mill is dropping 20 of her 40 stamps. The vein has been followed on its pitch for a distance of 3000 feet, or 2000 feet vertically, making it the deepest gold mine in the United States. That it has paid to this depth is an encouraging feature for all of the other mines in this section. The shaft is going on down from the 3000-foot level in search of additional wealth. The ore at this writing is from the 1800-foot level. On the east end of the mine a prospecting shaft is being sunk and is now down 160 feet in the country rock. This shaft will be continued until a depth of at least 700 feet is secured and the vein thoroughly prospected to that depth. If there is a shoot of good ore in that end of the mine, this shaft will find it, and if found the Idaho will renew her youth and be good for continued dividends for 20 years to come.

The Maryland.

Mr. S. P. Dorsey the superintendent of this mine, is quietly but persistently pursuing a course of development that will soon show whether the mine is a second Idaho. The fact that the mine is the extension of the Idaho, makes the work on the Maryland of more than ordinary interest to all parties. Mr. Dorsey has repeatedly refused the most tempting offers for his property, but has preferred to hold and prospect the mine, believing that in time he can show a vein as high in grade as that of its companion, the Idaho.

The Brunswick.

The Brunswick, E. Fitzgerald superintendent, disputes with the Maryland the possession of the Idaho vein, claiming that the vein passes into the Brunswick and not the Maryland mine. As that as it may Major Fitzgerald has opened up a large vein of high grade ore that can speak for itself and needs no parentage, as it can stand alone.

The Crown Point.

A Gauthier is superintendent and owner of the Crown Point. It has a 7-foot vein of \$17 ore. The mine is idle owing to the inability of the owner to erect the necessary hoist and pumping plant, that on the mine being but little better than none at all. The vein has been sunk on to a depth of 400 feet, and the ore proved to be of an average value of \$17 a ton. If this mine was properly equipped and developed with competent management, it should become one of the best mines in this section and the writer would like to have charge of it.

A Vibrating Amalgamating Table.

Mr. Gauthier has in operation at his mill his "vibrating amalgamating table." This is simply an attachment to the usual table by means of which the table is given a rapid vibrating motion. This motion holds the quicksilver on the plates, as high as 30 pounds being placed on at one time without loss. Then, too, the tables can be placed almost level, and but very little water is required, as the vibration carries off the sands. Careful tests show that the table saves 10 to 15 per cent more free gold than the stationary table. In fact, the concentrates below the vibrating table are but half the value of those below the ordinary stationary plates. This is an important fact in the working of ores containing low-grade sulphurets. If the table will save one-half their assay value, the other half can be run down the tail-race and a greater profit obtained than by chlorinating the whole at an expense near the value of the sulphurets.

The Empire.

The Empire, G. W. Starr, Supt., is now down over 2000 feet. A crossing of granite has been encountered, and while the vein continues on down through this, the gold is shy of it. In the W. Y. O. D., which parallels the Empire, a granite country was encountered in which the vein was almost barren; but in sinking a few hundred feet, this granite belt was passed through and slate struck, in which the vein regained its gold value. No doubt the Empire has struck this granite belt, or ore like it, and the sinking now being done will in time bring the vein into slate and pay ore. In the

meanwhile, the mill is dropping 40 stamps on low-grade ore.

The W. Y. O. D.

At this mine, of which C. A. Brockington is superintendent, the old five-stamp mill is clattering along and paying for all improvements. These improvements are on a good scale, and when completed, will place the W. Y. O. D. with the best mines of the camp. The shaft is being changed to three compartments, and will be continued on down without let up until a depth of 1500 feet is reached. The shaft is now down 850 feet and shows a four-foot vein of quartz that averages \$63 a ton. The ore shoot has been drifted on 170 feet and not gone through. This makes the W. Y. O. D. the richest mine in the district at this time. The improvements are about completed. The old mill that has ponred out dividends of \$5000 a month with five stamps will give way to a complete ten-stamp mill, equipped with every device for the rapid and economical handling of the ore and the saving of a higher percentage of the ore's value than was possible in the old mill. The crushing capacity of this mill will be treble that of the old one. A fine steam hoist is also being erected, that will sound the vein to a depth of 3000 feet. The plant on the mine is being erected by the well-known millwrights, Messrs. W. C. D. Body & Bro., whose reputation is sufficient guarantee that the plant when completed will be satisfactory in every particular. Messrs. Body should be credited with the erection of the North Star, Empire, Banner and Mt. Auburn mills; also the remodeling of the Idaho mill and the works of the Grass Valley Gold Extracting Co.

The North Star.

The superintendent of the mine is not allowed to give any information in regard to the property, and as the writer does not care to give it second-hand, I will simply state that the mill is one of the finest in the State, and the mine one of the largest dividend-payers of the Grass Valley section. The shaft is down 2300 feet.

The Omaha Cons.

The Omaha, Geo. Mainhart, superintendent, has a vein running from ten inches to two feet of ore that averages \$20 a ton in free gold, and carries 40 per cent of \$75 to \$80 a ton sulphurets. The 28-stamp mill is running regularly, crushing $1\frac{1}{2}$ tons to the stamp.

The Menlo Cons.

Mr. Lakeman is superintendent of this company. The mines are the Homeward Bound, Wisconsin and Illinois. The shaft on the Wisconsin is now down 200 feet, and will be continued for 300 additional feet. The vein is now from 9 to 12 inches in width of \$30-ore. On the Homeward Bound the shaft is down 300 feet on an 18-inch vein—the Homeward Bound is idle at this time. The Illinois is the extension of the Wisconsin.

The Pennsylvania.

This mine, John Eddie, superintendent, is near the W. Y. O. D. The superintendent is developing the mine. The shaft is now down 400 feet on a vein that runs from 6 to 18 inches. At this time there is but a hoist on the mine. Once the vein is satisfactorily developed, a mill will be erected. "First the mine, then the mill."

The Peabody.

E. Tilley is superintendent of this mine. It is the property of the Nevada Development and Improvement Co. The new three-compartment shaft is now down 300 feet on the vein, which is 50 feet below the old workings. Stations have been put in and drifts run north 40 feet and south 25, from the bottom of the shaft. At this point the vein is 18 inches wide—the ore is here very high in grade—the last test running \$100 to the ton.

The old hoist is utilized to pump out the water of the mine. In the old workings the vein was drifted on for a distance of 700 feet. The ore throughout averaged \$25 a ton. The present shoot in the new shaft exceeds the one in the old workings by \$75 a ton. The company will continue sinking and drive levels ahead 100 feet.

The Coe.

W. Floyd, formerly of Amador county, is superintendent. The shaft is now down 500 feet. Drifts are being run east and west to cut shoots of good ore that crop on the surface. At the same time the shaft is being repaired. The vein in the Coe runs from two to five feet.

Pittsburg.

John White is superintendent of the Pittsburg. The shaft is down 1000 feet and a very complete 10-stamp mill erected on the mine. The superintendent is working to find the vein beyond the point where it was lost on the 300-foot level. In driving, a crossing was encountered which threw the vein west, but the drift was continued in a direct line and the vein lost. Mr. White will croset west and expects to cut the vein in 10 feet. The mine has been a large producer in her former history. If Mr. White can renew her youth and make the mine what it was under him in years gone by, his fortune is made.

The Union Hill.

Mr. E. A. Wiltsee is superintendent of the mine. It is $1\frac{1}{2}$ miles east of Grass Valley, at the foot of Union Hill. The mine was worked up to 1870 to a depth of 350 feet by shaft. The reputation of the mine is good and there is every reason to believe that, shorn of the old faults and under Mr. Wiltsee's management, the property will prove valuable.

At present a series of shafts are being put

down all along the vein to determine the location, pitch, width and value of the vein before commencing a permanent shaft. This is what should be done on every mine, but the writer has seldom seen it done. Mr. Wiltsee is a Colorado miner and his Colorado methods work in very nicely in this section as well.

The Banner.

M. L. Elliott is superintendent of this claim. The 10 stamp mill is running on ore from the 200, 300 and 400-foot levels. The vein is now 15 inches to 10 feet in width, with an average of two feet of ore that mills \$25 a ton. The quartz carries $\frac{1}{2}$ per cent of sulphurets of \$135 a ton value. The best indication of the mine's value is the regular dividend of \$5000 every six weeks.

The Standard.

John Skews is superintendent of the Standard. The mine is $2\frac{1}{2}$ miles northeast of Grass Valley. The property is opened by a tunnel 250 feet long, that shows up an 18-inch vein of \$20 ore carrying in addition three per cent of \$150 a ton sulphurets. Mr. Skews will drive a lower tunnel and then sink on the vein. If Mr. Skews don't make the Standard the equal of his old mine, the Banner, it will be simply because it can't be done.

Wyoming.

S. B. Fowler is superintendent. The mine is in South Grass Valley adjoining the Boston on the south and the Lawrence on the north. In the earlier workings of the mine, the ore milled \$25 to \$112 a ton. The present owners erected a hoist and had a shaft put down 60 feet, when it was discovered that the vein was pitching in one way and the shaft in another direction; as this was not likely to prove up the character of the vein, they have shot down until the hoist can be swung around and a shaft started on the vein as she pitches.

Centennial.

This mine, A. W. Stoddard, superintendent, is two miles south of Grass Valley, on Osborne Hill, at an elevation of 3100 feet. The company is erecting a hoist and five-stamp mill, and cleaning out the old works. The vein in the old workings is from 12 to 18 inches in width of ore that is said to have milled \$50 to the ton.

Reopening Old Mines.

A large number of the old mines of the section are being reopened, and in every case the prospects so far are very flattering. Capitalists have found Grass Valley a good camp to stay by, and the man that has the "sand and soap" to go down 1500 feet on any gold-bearing vein in this section can rest assured that he will be handsomely repaid for his outlay. As in the past, so now Grass Valley still retains her supremacy as the leading gold-quartz mining district of the State.

E. H. SHAEFFLE.

No Forests, No Irrigation.

EDITORS PRESS:—Closely connected with irrigation is forestry, a forest system for maintaining the integrity of the watersheds.

There are two aspects of this question both dovetailing together: 1st. The protection of perennial springs and streams. 2d. The protection of reservoirs from silt and detritus.

It is well established that the delivery of a given rainfall is slow and perennial or rapid and deluvial in proportion as the watershed is tree or brush covered. A forest-covered watershed offers innumerable impediments to the rapid flowing off of rains. The snows melt slowly and the evaporation is at a minimum in forested areas. The French forest officers have shown this in a number of experiments, nowhere more clearly than at St. Phalay. At this point there are two mountain watersheds of almost identical area, slope and exposure—the one is forested, the other bare. In the forested watershed, the rainfall is delivered in a clear stream of a perennial type. No serious floods have occurred. In the bare watershed the rainfall flows off in a few hours, carrying sand, boulders and soil, and often doing great damage to roads, bridges and farms in the lowlands. Supposing a given rainfall to be 1,000,000,000 gallons on each of these watersheds in the one case, it is delivered in 90 days, in the other in nine hours. In the one case, with compensating calculations, about 1,000,000 gallons pass a point on the forested stream per hour. In the other case, about 100,000,000 gallons pass per hour from the nonforested stream.

In the forested stream there is practically no detritus, and its channel is permanent and reliable. The unforested stream, when discharging water at all, is always full of mud, sand and stones, its erosive power is enormous, and at every lowering of grade it must dump a part of the load either in its own channel, which thus filled up is liable to change, or upon adjacent lands to their injury and destruction.

In the first report of the State Board of Forestry, a number of instances were collected in California showing the disastrous results upon springs and streams, both in diminishing or destroying their summer flow and increasing their flood power, due to the harruig of the trees and brush on their watershed.

If you take a city garden slope with grass on it and observe the rainfall delivery, and then look at a similar cemented slope, you may perceive in miniature the effect of forests upon watersheds.

Deforestation in such old irrigation countries as Palestine, Persia, South France and North Africa has already destroyed the sources of

water supply over wide areas. No country of them all is more open to similar results than California. Our dry season is longer, our mountains are higher. If we remove our forests in the mountains without due provision for forest maintenance and renewal, we will change the mountain watersheds from a slow and gradual delivery of their rainfall to a quick and disastrous one. The more bare they are made and the more rooflike they become, the more sudden and disastrous must be the delivery of the rainfall. Such sand and stone-charged floods can do only damage. The water that destroys in the flood is subtracted from use in irrigation.

Every one in California, whether interested in irrigation, in town supplies of water or in the preservation of the lowlands from detritus and flood, should unite in pushing and working for an effective national forest system for the safety of the State.

ABBOT KINNEY.

Kinneloa, Aug. 29, 1891.

Fake Mining.

In mining, as in every other department of human industry, says the *Amador Ledger*, there is a class of spurious operators, as well as the genuine searchers after precious metals. It is often very hard, if not impossible at first to distinguish the legitimate from the counterfeiter. The latter frequently have all the characteristics of the honest investors. They spend money freely in underground work, in the erection of surface improvements, and improved machinery for saving gold. In all quartz mining sections there are barren as well as paying ledges. It is an easy thing to find quartz, but it by no means follow that all quartz, even in a gold-bearing section, carries gold in paying quantities. Nature in the formation of gold has worked by an inscrutable rule. In one point she piles up her treasures in abundance, and a few feet away the same vein may be comparatively barren. This very uncertainty in gold-mining is after all an essential element in keeping gold in its royal place at the head of precious metals.

It sometimes happens that a company is organized to search for precious metal from the best of motives, and enters upon the work of active mining in the proper spirit. After a while the prospecting perhaps does not come up to expectations, and the next thing in order is to get out of the speculation without loss, or may be make a profitable enterprise out of it, in spite of the non-productive character of the claim. Then a raid is inaugurated upon the public by means of stock gambling. The stock of the worthless scheme is thrown upon the market, and every method known to the shrewd operator is resorted to in order to boom the shares. Meantime improvements continue to be made at the mine on a magnificent scale for the sole purpose of deceiving the public as to the value of the property. A mill is erected and started on ore that is known to fall below the paying standard. The utmost secrecy, however, is enjoined upon all employees, and over the door one is apt to read the words "No admittance." Reports of big yields are sent out, but no one outside of those actually concerned in cleaning up and retorting the hullion, is able to tell the actual product. Everything is kept in the dark. The gold is not sent below by the ordinary means, probably from fear that the poverty of that concern might leak out. A dividend is declared, the money for which is supplied by the insiders for the object of working off the stock upon a gullible public. In this way the projectors are enabled to feed out the worthless shares at fat prices, and so not only get out of the scheme without loss, but actually make a profit. When they have let go in this manner, the bubble bursts, and the swindle is exposed, and too often a rich mineral section is made to suffer in the estimation of capitalists by these rascally operations.

The *Ledger* has always held it to be a duty to discontinue all schemes looking to the operation of mines by means of stock-jobbing. In nine cases out of ten they end in disaster, and the recoil is harmful to the all-important industry of this county. The honest investment of capital in the search for gold will always be encouraged, but wild-cat ventures organized for preying upon the pockets of the over-credulous in San Francisco, New York and other centers should be frowned upon. They may make things lively for a time, but when the collapse comes, as it generally does, the reaction more than neutralizes the direct effect of the injudicious expenditure of money in such concerns.

INCREASED VALUATION.—The State Board of Equalization has largely increased the assessed valuation of real and personal property in several of the counties. The increase in San Francisco is \$98,308,559; in Los Angeles \$13,201,813. San Francisco's assessment has been increased 30 per cent. Los Angeles and San Bernardino county have been raised 15 per cent; Santa Clara, 3; San Mateo, Orange and Santa Barbara have had ten per cent added, and Kern and San Joaquin 5 per cent. Without any increase by the board the State rate would have been 48 cents 8 mills on each \$100 valuation, or \$4.88 on each \$1000. With the increases made by the board the State rate will be 44 cents 6 mills on each \$100, or \$4.46 on each \$1000.

THE adjourned annual meeting of the Anti-Debris Association took place at Marysville, Saturday Sept. 12.

Placer Mining in Alaska.

The following extracts from a letter of Mr. McGrath of the Yukon river boundary survey party, will be of interest to miners:

"The most important, indeed, almost the only industry in this country is mining, but it is hard to arrive at any satisfactory conclusion as to the real value of the country for mining purposes. Men have run about in all directions prospecting, but have found no good permanent washings except those on Forty-mile creek. On the Stewart river, I believe that \$100 a day per man has been taken out on one of the bars, but now all the miners have deserted that stream and the only work there is done by Mayo with a steam pump operated by his boat, the New Racket. This pump is the first one ever brought into the country, and we have not yet heard what results have been obtained. On every stream in this region, "color" can be found, but unless a man can make \$4 or \$5 a day on a bar from the first, he must leave it to go on to another place to try for better luck. The cost of living is very high in this country and the working days are few, so that a miner must get good wages to enable him to pay his expenses. In a fairly good season a miner working for another wants \$8 per day as wages, and I doubt if even on these terms any man has ever made much of a stake after a season's work. The country is very wet, and when the creeks rise, the ordinary workable bars are flooded; water-wheels, flumes and ditches are swept away, and time and again it happens that a miner gets his preparatory work finished only to have it all carried away by a sudden freshet.

"Not having the command of any considerable capital, the miners cannot put in extensive works, and thus many of their improvements are destroyed because they are not substantially constructed. Even on Forty-mile creek, however, no fortune has been made, and a man who gets out with a couple of thousand dollars is not to be met with every day. Some miners have lost all faith, and tell us that the creek is worked out, and that when a little more cleaning up is done, there won't be a living in it for a Chinaman. Another man will come down the river and report that many men are doing well, and that the creek has been hardly skimmed over. About the end of July, 1890, some miners came down with most disheartening reports. They said that the men were on short rations and had almost all been standing about idle on account of the flooded state of the river; that last year was unusually bad, and the little money some possessed had to be paid out for living. They themselves had prospected around and finding no good place to work, had decided to leave while they could; most of the men would have to go down the river to get enough food to keep them alive, or use the remainder of their provisions in reaching the coast over the Chilkoot trail. Well, this story turned out almost entirely wrong. All the miners except four stayed in; the creek got low, and by the time that Trader McQueen reached his store, on Aug. 20th, it was estimated that there was not half a dozen men on the creek who couldn't pay cash for their year's supplies. Nuggets were plentiful, one worth \$55 having been taken out during the summer. One party of four men were getting out two ounces of gold per man per day, and had a bar that would last them until the next summer. On the first day after McQueen opened his store he took in \$4000 in cash, and the whole camp was joyful. I suppose that 1890 will be a red-letter year on the creek.

"From what I have said you will gather that mining is rather hazardous here, but I still think that the industry will attain great importance in this region. Personally, I should not care to come here to mine, but then I should not care to take the risks that any practical miner is ready and accustomed to take. I should think that a strong company that could put in good machinery, and could afford to do a great deal of preparatory work, would make money on many of these streams, but when McQueen and Mayo get their steam pump to work on some of the bars, they will probably be able to show results which will determine the matter in one direction or the other."

Sheep Mountain.

V. E. Helsner and Jack Dowling came from Sheep Mountain, in Custer county, on Saturday last, bringing many specimens of ore, the principal of which was from the Rufus mine, in which John Early, of this city, holds a large interest. This mine is well developed and ore from it has been tested in this city during this week that goes \$1,200 to the ton in silver. This is said by the gentleman who brought it to the city to be an average, but of course he is enthusiastic. The owners have without doubt a very rich mine. Some two years ago Mr. Early sent a pack train to this same locality and brought in a quantity of ore. The Rufus is said to be 30 feet wide, and has gangue rock paying all the way between walls. The district is in a very high altitude, where silver is generally most abundant. There have already been two snow storms in the surrounding mountains since the 15th of July. Thirty-six mules had just been loaded with ore to take to Ketobum for treatment before Mr. Helsner left. Two pack trains take ore from this mine to Ketchikan each week. One is owned by Frank Turner, the other by "Kosent," both of whom

are well known in Boise. While Mr. Helsner was gone he made three locations adjoining or near the Mountain King, and has great hopes that they will prove to be good mines when fully developed. Specimens he has in his possession and represents as having been taken from his prospects, are first-class in their appearance.—*Idaho Statesman.*

State Weather Service.

We were pleased to commend earnestly the effort for the establishment of a State Weather Service by the last Legislature. It was shown that Serg't Barwick was ready to direct such a service without compensation, and the United States Government would furnish the blanks and franked envelopes for the transmission of reports, and that in fact the State could have the service at a very little expenditure for work and printing. The Legislature seemed, however, to have something more profitable in mind than weather studies and declined to provide for the service. This did not discourage Serg't Barwick—in fact we have yet to see what will discourage him. He arranged a crop report service under the auspices of the Agricultural Society, and now comes along the State Weather Service by way of Washington.

Our readers know, of course, that the Weather Service is now a part of the Department of Agriculture, not of war.

The chief of the new service is Prof. Mark Harrington, and he has provided a State Service for California, and appointed Serg't Barwick director thereof, with the title of Weather Bureau Director, and with headquarters at Sacramento. There are some 50 voluntary observers who have been for years past sending their reports direct to the Chief Office at Washington. They have been instructed to hereafter forward their reports to Mr. Barwick.

We are authorized to announce that any one in any county who desires to help the Director of the State Service to make this service equal to the best in the Union, and who will apply to Serg't Barwick at Sacramento, will be furnished with blanks and franked envelopes for sending their reports. Those who have no instruments can become crop correspondents, reporting the conditions, etc., of crops at the end of each month and the effects the weather has had upon all growing crops. Of course any person in the State who has his own instruments and would like to have his records published can do so by sending them to Serg't Barwick, who will send them forms and envelopes and a book of instructions.

In places that are 50 miles from points where observations are taken, observers will be furnished with a set of instruments consisting of one maximum, one minimum thermometer and one rain gauge and measuring sticks, by giving a personal bond for the proper care of the instruments that may be placed in their possession.

The Weather Bureau will also endeavor to distribute more widely than has been possible heretofore, weather forecasts, rain warnings, etc., and to collect and publish climatological data which shall be of value to the several States and Territories. Any towns or villages desiring the forecasts sent them by telegraph free of cost can have them either by telegraph or telephone, providing they will pay a set of flags, four in number, and hoist them as would be designated by the weather forecasts as sent out from San Francisco by Lieut. Finley, the forecast officer. Parties can learn more in regard to this matter by addressing either Lieut. Finley, at San Francisco, or Serg't Barwick at Sacramento.

The foregoing gives an outline of the movement to extend the weather service and to render its work more directly valuable to the people. We trust this will attract the attention of our readers and win their co-operation. We have made wonderful progress in this direction during the last few years, and there seems reason to believe that we are but at the beginning of an undertaking of the matters involved, which will be wonderfully satisfactory and practically profitable.

IT PUCKERED UP.—The following story of unsuccessful prospecting is told in the *Geneva Courier* on R. H. Galatt, the well-known stage proprietor of Douglas county: "Do you see that white spot on the hill yonder?" said the Judge. "Well, that's Dick Galatt's alum mine. When Dick drove stage here he used to tell the passengers this story: 'You see, I'd struck the genuine Boulder Hill ledge and had run a tunnel about 40 feet, when about sundown we struck an immense body of alum. We quit work, and the next morning when we got ready to work, I'll be blown if we could find a trace of the tunnel or ledge.' 'Why, what became of it?' asks the unsuspecting tourist. 'Well, you see there was a heavy rain that night and the whole thing puckered up.'"

It has been decided to have the Machinery Annex at the World's Fair, an annex in fact instead of being an isolated structure as at first planned. The annex will adjoin Machinery Hall on the west. The entire structure will thus measure 500 by 1400 feet, and be second in size only to the Manufacturers Building, the dimensions of which are 788 by 1688 feet. With its galleries, the latter building will have 40 acres of floor space.

Pigs Found the Copper.

The Scientists Knew It Could Not Be There, but Nevertheless It Was.

"How was the Calumet and Hecla discovered? you ask. Here, Captain Donnan, you tell this man what he wants to know."

These appealed to, the broad-shouldered, smiling-faced man whose spirit pervaded the great copper mine stepped up to the little group waiting for dinner in the hotel at Osmet.

"It was pigs," he said.

"Yes, it was pigs," echoed the group.

"Pigs!" I exclaimed incredulously.

"Pigs, and no mistakes," remarked the captain. "Back in 1863 an exploring party came here to try and find copper. They built a shanty to live in, and of course they brought some pigs. One night the pigs were lost. The boarding-house keeper started out to find them. After a long search, he heard the pigs rooting and squealing, but he could not see them.

"The noises seemed to come from down in the earth. Next morning, a party of men went back to the place whence the noises came, and after a search, they found a pit 10 or 15 feet deep. The month was covered with bushes, and the growth of the trees about the sides gave evidence that it had not been used for centuries. There the pigs were contentedly rooting among the broken pieces of rock.

"A rude stone hammer and some charred sticks gave evidence of earlier explorers who had evidently gone away unsuccessful. The hammer was of the same kind as the other implements, which had been traced back to the days of the predecessors of the Indians whom the French found in possession of the lands—the Indians who built the mounds, and who overran the whole country from Mexico to Lake Superior, where they got copper for their implements and utensils.

The mound-builders, like the explorers who had discovered the ancient pit, looked for copper only in masses, as it had been deposited in fissure veins and in the lava flows. The huge chunks of virgin copper weighing many tons, and the smaller masses hanging in the rocks like metal icicles, were the only kind known to the ancients, and the moderns had been assured by the learned geologists that copper could be found only in rocks formed from lava.

"But the pigs had turned over pieces of rock formed by the action of water—aqueous rock—and in these conglomerates there certainly was copper. This seemed a find indeed. But when the matter was reported, science scoffed at the explorer, saying that the copper conglomerates found were simply a freak of nature, and that money would be wasted if an attempt were made to work them.

"So Mr. Haribart, who owned the lands, continued to give his attention to the Huron mine, which was working the lava flows. For the money he borrowed for the Huron, he gave to Quincy Shaw of Boston the lands on which the conglomerates were found. Mr. Shaw soon began to work these rocks, and from these beginnings, the richest, most stable and the best promising copper mine in the world has been built up."—*Detroit Tribune.*

How Gold is Shipped.

As few people realize the vast bulk of gold coin that is shipped annually from one country to another, and are unacquainted with the manner of shipment, the following from the *American Banker* will be interesting:

The Bank of America is the largest single shipper of gold from New York, and indeed from the United States. Shipments are made in stout kegs, very much like the ordinary beer keg. Every one contains \$50,000 in coin or bar gold. The latter is the favorite of these shippers, since the Government has permitted the Sub-Treasury to exchange coin for bar gold, as coin, in a single million shipment, is liable to loss by abrasion of from 8 to 20 ounces, or from \$128, to \$320; while the bars only lose about three-fourths of that value. Where coin is sent, double eagles are preferred. They are put in stout canvas bags, each containing 250 double eagles, or \$5000, and ten bags fill each keg. About the only precaution taken against tampering with kegs is a treatment of kegs' ends technically known as "red taping." Four holes are bored at equal intervals in the projecting rim of the staves above the head. Red tape is run through these, crossing on the keg's head, the ends meeting at the center, where they are sealed to the head by the bardest wax and stamped with the consignor's name. The average insurance is about \$1500 per \$1,000,000. There is an expense of about \$2 per keg for packing and cartage aboard ship, or \$200 for the same sum and the inevitable loss by abrasion, whatever it may prove to be. The great Wall street firms ship from \$25,000,000 to \$40,000,000 annually. Some of these have for years insured themselves, and assert that the saving has been sufficient to replace a loss of \$1,000,000. These are large figures, but this has become a country of large figures and affairs.

The loss by abrasion on every \$1,000,000 in gold coin shipped across the Atlantic is said to be between one and two thousand dollars.

JOHN COLEMAN, Supt. of the Ruby mine, near Forest City, Sierra Co., was shot and killed on the evening of Sept. 3rd by John St. Pierre, the watchman at the mine. The flames at the mine have been robbed several

times recently and Coleman censured the night watchman for negligence of his duties. St. Pierre felt aggrieved and murdered Coleman.

Electricity and Industry.

In the census taken ten years ago, a department was devoted to the subject of power used in manufacturing, but its reports and tables dealt only with steam and water power and made no mention of electricity. During the ten years that have intervened the application of electricity to industrial purposes has been wonderfully rapid. About two years ago, *Electric Power*, a New York journal, printed a list of 150 industries to which the electric motor had actually been applied in this country, and one of the editors expresses the opinion that if a list were now prepared with equal completeness, it would show that the electric motor has found employment in connection with nearly 300 branches of productive industry. The electric motor has been successfully used to run the sewing machines of girls employed in glove-making in their own homes, and with the reported result of enabling each worker to accomplish more and better work in less time, and under conditions more favorable to health and causing less fatigue.

With these facts before us, the introduction of electricity as a power applicable to a great variety of industries, and available in the private home and at the individual work-bench, is no longer a dream or a prophecy, but an actual realization, of which the possible future development and industrial influences cannot be foretold. One of the principle articles of belief of the cheerful economic creed so aptly propagated by Mr. Edward Atkinson is that natural forces are constantly tending to a distribution of population more favorable to individual welfare. That where men have been too much isolated on great farms and sparsely settled tracts of land, the tendency toward higher cultivation of smaller areas is operating to bring them into closer and better relations with the world, and that, on the other hand, where population has become too closely concentrated, in crowded cities and towns and over-crowded tenements, the development of rapid transit is operating to secure a distribution over a larger area, and to correct the evils incidental to a congestion of population at industrial centers.

In the latter direction, nothing could be more efficacious than the gradual adoption, in many industries and at many manufacturing centers, of a form of power peculiarly suited to such distribution as would do away with the necessity for crowding hundreds of operatives together in the work-rooms of great factories. Such a change could be made to bring with it an amelioration of many of the conditions which now occasion most complaint, and to secure for a great mass of workers more wholesome and cheerful surroundings, less crowded and better lighted and ventilated. Such a change seems like a dream of a return to the days of the hand-loom and spinning wheel, and its possibility is an answer to much of the sentimental lamentation constantly heard about the changes which time and development have wrought in the condition of the toiling masses. Progress in the application of electricity to the employments of men is but one of innumerable evidences that an improvement in social and industrial conditions is to be sought in the higher development of mechanical invention, and in the advancement of science rather than in vain regrets for the simpler life of their irrevocable past.—*New York Commercial Bulletin.*

HOW ONE FEELS WHILE FALLING FROM A GREAT HEIGHT.—A Boicot (Wis.) correspondent of the *Chicago Inter Ocean*, gives the fearful experience of an actor while falling four stories through an elevator shaft in Beloit: Mr. G. W. Sparke, the actor of the East Mall Company who fell four stories through the Goodwin House elevator shaft, will be taken to the Presbyterian Hospital, Chicago. He will survive, and in all probability will not be maimed for life, as was feared. His experience in falling was thrilling. "I opened the door quickly, and rushed into the room, as I before stated, to pack my grip, feeling for a match as I did so. I suddenly realized that I was falling, and inwardly cursed the step, thinking I had slipped off a step. Then I knew I was going down a shaft. I kept striking against something which I thought was boxes. My business has so associated galleries and boxes in my mind that this seemed to flash before my eyes, yet I counted one, two floors, and thought I would land on the third. 'I will save my temples and brain,' I said to myself, 'when I strike, and put my hands and arms to my head.' I was sure I was not going to be killed. When I passed what I thought was the third floor and was yet going down, down, down, an awful sensation came over me, a thousand times more horrible than what I had experienced, and I thought 'mercy! mercy!' I heard my bones crack and I knew I was dreadfully hurt, and thought I would call Mr. Carter, and if he did not hear me I did not know what I would do." Several persons heard me call "mercy."

THE NEW HERRESHOFF STEAM YACHT, built for Mr. W. R. Hearst, of San Francisco, made a trial trip lately at the rate of 24 miles per hour under 200 lbs. of steam. She is licensed to carry 260 tons, and is guaranteed to make 25 miles per hour. The yacht is 110 feet long, 12 1/2 feet beam, and 5 1/2 feet draught. She has an 800 H. P. quadruple expansion engine, and tubular boiler of the Thornycroft type.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

KENNEDY.—*Ledger*, Sept. 12: The last monthly dividend paid by this company was 30 cents per share, against 40 cents for the previous month. The reduction was owing to running through a larger quantity of the lower grade ore. The cleanup amounted to over \$40,000 without sulphurets.

NEWTON COPPER MINE.—J. A. Ferson, who is largely interested in this property, was in Jackson this week with a capitalist from San Francisco. There is a movement on foot looking to the building of a smelter at this mine. It is claimed that the ore is better for smelting purposes than that at Copperopolis, and the indications are that the ore body is equally as large. The Copperopolis mine gives employment to 150 men, and it is believed that with 100 men the metal output of the Newton would equal the Calaveras mine. No underground work has been done on it for years, and the introduction of the smelting process would give an immense impetus to business, and lead to the building up of a town at Newtonville.

Calaveras.

MINE BONDED.—*Mt. Echo*, Sept. 10: The Thorpe mine, situated in the South Calaveras mining district, and about midway between Angels and San Andreas, has been bonded to the Utica Gold M. Co. Operations have been commenced on the property and it will not be long before the mine will be in excellent working order. This is without doubt a good mine, and under the management of this company we look for big results.

MINING IMPROVEMENTS.—Quite a large force of men are employed in digging a ditch along Bush street from the Utica mine to the Lane & Tulloch mine in the southern part of this town. As soon as the ditch is completed a 20-inch iron pipe will be laid in it to convey water to the latter mentioned mine. This is an extensive as well as expensive undertaking, but it is evident from what is being done that the company has faith in the Lane and Tulloch property.

EXTENSIVE IMPROVEMENTS are being made on different mines in this vicinity at present and an immense amount of money will be expended in putting mining properties in condition for operating on an extensive scale. That the mines are here there is no doubt and no better evidence need be offered than the fact that the long-talked-of mother lode courses through this town, and also that the Angels, Utica, Stickle and Marshall mines are located on it. At a depth of 600 feet the vein is hundred feet and over in width, all good milling ore, carrying sulphurets of a high grade. Such a town is Angels at present and its outlook for the future is better than any place we know of.

El Dorado.

PACIFIC.—*El Dorado Republican*, Sept. 10: The Pacific Co. have had a force of men engaged for some weeks in cleaning out the shaft on the Harmon mine and have sunk it 12 feet deeper. They uncovered some very fine rock about a week ago.

SEAM MINING.—*Georgetown Courier*, Sept. 10: James Davis has purchased of E. C. Cheek his seam claim adjoining the Crane's Gulch mine. The old pioneer knows the mine well, and believes he can work it to good advantage. The shaft on the Darling reached a depth of 100 feet last Monday. The excessive flow of water has necessitated the putting in of a larger pump. The ledge holds its size and the ore its richness. Considerable preparations are going on among miners to open up, develop and work new as well as old claims, and everything portends a revival in mining. The season just closing has been unusually quiet, but it is now apparent that people generally are waking up to the necessity of working our mines in a more thorough and systematic way.

DRIFT.—There are some valuable drift mines on the Middle Fork of the Middle Fork below Ralston's which are being steadily worked. Among the mines which are being successfully worked are six claims as follows: Mike Corcoran, Oscar Vaughn & Co., Job Pierce & Co., Marshall & Wright, Baxter & Co., Mike Bagan. The gravel mines at Volcanoville are also being developed, and some of them producing handsomely.

Mono.

JORDAN DISTRICT.—*Bridgeport Chronicle-Union*, Sept. 12: The combination tunnel of the Goleta, Montecito and Sterling mines in the Jordan district is being pushed ahead energetically, and the indications are good for the ledge being within easy running distance, and liable to be cut within a very short time. The tunnel is in 850 feet. The work of getting out ore from the Dunderburg mine, near Bridgeport, is progressing. Several tons will be shipped to be worked by mill process. A. F. Bryane, who left for San Francisco on Monday, took two sacks of ore from the two drifts for a sample working.

BODIE.—Supervisors have been surveying the disputed ground of the Bulwer-Standard, containing the rich strike reported a short time since. For the good of Bodie and the county generally, it is to be hoped that the two companies will settle the disputed points without a resort to the courts again.

LUNDY.—The Lakeview mine at Lundy is looking fine, and a recent working of a few tons of ore paid splendidly. The new 10-stamp mill will be pushed to completion as fast as possible.

Nevada.

THE FEDERAL LOAN.—*Transcript*, Sept. 7: Last week a clean-up of 189 ounces of gold worth nearly \$3000 was made at the Federal Loan after four weeks' run with five stamps. This did not include the gold from the sulphurets, of which the company has about 35 tons on hand. The gold cleaned up exceeds by about \$700 all the expenses of extracting and milling, also the cost for the month in sinking the shaft and driving the drain tunnel. The ore crushed came from the 150 and 300 levels. Yesterday a splendid looking ledge a foot and a half thick was struck in the shaft. The Federal Loan has a bright outlook.

RICH STRIKE.—*Grass Valley Telegraph*, Sept. 7: There has been a large and very rich ledge unearthed in the Coe mine. The ledge is full of coarse gold and is heavily sulphuretted. The new ledge was

found in the east drift about 130 feet from the shaft and is about 3½ feet in thickness. The strike is very encouraging and creates much talk among mining men.

SHOULD BE WORKED.—*Grass Valley Telegraph*, Sept. 10: The Dromedary mine, just within the town corporate limits on Wolf creek, lies practically idle. Such should not be the case, for the Dromedary in years gone by yielded most handsomely. For the past three years this mine has been more or less developed by the Berriman Consolidated Gold M. Co. The development work consists of a new two-compartment shaft 60 feet in depth. Rock extracted from the shaft yielded an average of \$40 per ton, and some fine specimens were also taken out. Grass Valley has more than double as many mines idle as are working and which surely would pay. Such we believe will not always be the case.

MINING ON THE YUBA.—*Grass Valley Union*, Sept. 9: The mining operations on the South Yuba river, being carried on by Bourne, Pollard & Co., have been interrupted by finding that the ground uncovered is not over the old river channel, which is nearer the south bank. This will require a change in the line of the wing dam, and a shifting of the position of the pump, which will require several weeks' time. The edge of the pay gravel has been encountered, which prospecting at the rate of 50 cents to the pan, but it could not be worked into, as, being under the foundation of the pump and the site of the wing dam, there was danger of striking a strong flow of water that could not be controlled. It is getting late in the season to make the necessary changes in the plans of working, but some of the company believe that this can be done, and sufficient time left to have a few weeks to work in the gravel channel. There is no doubt felt but what the ground will yield richly now that the pay channel has been definitely located.

A GREAT BED OF KAOLIN.—*Grass Valley Union*, Sept. 16: John H. Nichols, who has been prospecting during the past season at Pine mountain, on Lower Wolf creek, in quartz, has found a bed of kaolin which is over 100 feet in depth. Not much prospecting has been done in it, but sufficient to show that it is largely free from impurities, while a portion of it is mixed with sand. The signs indicate that the clay is 100 acres in extent. In one part a quartz vein is found of low-grade quartz, but as large size it is believed will make it profitable for working, as it has been penetrated seven feet and not cut through. A peculiarity of this vein, as far as prospected, is that it has no inclosing walls of country rock, but is closed in on both sides with kaolin. It is contemplated to put up a battery this winter to prospect the quartz vein. The statement that has been published that it is the intention to establish a pottery on the ground to work the kaolin is not correct, the plan in present contemplation being to establish the pottery in Grass Valley and haul the clay here, the distance being ten miles. But the plan is as yet indefinite and has not assumed form, and no immediate working of the kaolin bed is contemplated.

TELEGRAPH MINE.—The steam hoisting works of the Telegraph mine will be ready to start up today. The incline shaft on the vein, which has been in the course of sinking for some time, has reached a depth of a little over 100 feet. A small vein of quartz has been in the incline all the way, and the quality of the rock is good. Not much water is coming in, but with the aid of the steam machinery, no trouble will be experienced from water in the future sinking of the shaft. The Telegraph is on the same vein as the W. Y. O. D., and the prospects up to the present time are considered very encouraging.

IMPORTANT STRIKE.—*Transcript*, Sept. 14: One of the most important developments that has been made here in years is that in the Nevada City mine. When the present company came into possession of the property, it concluded to commence operations some distance from the old workings, on account of the delay attending the pumping out of the old shaft. It commenced operations in a systematic manner, and the mine has been worked without a very large expenditure of money outside of what it has yielded. They have a splendid looking ledge on the 300 level, and the striking of the same ledge of a larger size and richer in quality on the 400 has demonstrated that they have a very valuable property outside of the old workings which is known to contain an endless quantity of good ore. Every indication points to the fact that the ledge on the 400 will be found on the 500, and how much deeper no one can tell.

NORTH BANNER MINE.—*Grass Valley Union*, Sept. 12: Some delay has been occasioned in putting in an additional pump in the North Banner shaft because of necessary castings not being ready, but now everything is in order. In the meanwhile the pump heretofore in use has been holding the water below the 400 level, and the stopping of ore from that and the levels above has been going on regularly, although the sinking of the shaft had to be temporarily suspended. The vein in the shaft is strong and the ore of high grade. Notwithstanding the interruption of work on account of striking a strong flow of water, the mine will give about its usual yield for the month.

CALIFORNIA MINE.—*Grass Valley Telegraph*, Sept. 10: The hoisting and pumping machinery are now about ready to start at the California mine, and Mr. W. S. May has done a good piece of work with the building and in placing the machinery. It is expected that on Monday next, steam will be started at the mine and then the work of sinking the shaft to a greater depth will be commenced. The building of the mill will be immediately begun, and by the 10th of November the new mill will be at work on rock from the mine.

Napa.

THE BLACK BEAR MINE.—*Calistogian*, Sept. 9: Road-making, getting out timber, and other preliminary work necessary for the beginning of labor in the Black Bear quicksilver mine, Pine Flat district, has been going on for some time past, and operations underground will soon begin. It will be remembered, at least by some of our readers, that all the workings in this mine have been caved. The shaft, through which it was intended to work the mine the past few months, caved in last winter. An old tunnel, 250 feet in length, is caved more or less, and was so before the present owners took possession. This tunnel is to be reopened, and its condition may be such, that much of the coming winter will be required to complete the work. When fin-

ished, no time will be lost in taking out cinnabar. It is there, but the trouble has been to get an opening through which the ore can be brought to the surface.

THE PALISADE.—We understand that the reduction works at the Palisade mine will not continue in operation much longer before being shut down. Work in the mine will be continued, however, particularly in the shaft in King canyon, where the hoisting works are located. This is to be sunk deeper, and a new level opened. Another run of the reduction works is not contemplated until after this work is completed. It appears that the company has decided not to work low-grade (\$10 or \$12-ore) as was the case during several months, when the reduction works were first operated. Only high-grade ore receives, or will hereafter receive attention.

San Bernardino.

CALICO.—*Cor. San Bernardino Times-Index*, Sept. 11: The Waterloo M. Co. have built a branch from their main motor railroad to Calico, and are transporting 100 tons per day of silver ore from the Silver King mine. This, together with what they are shipping from the Waterloo mine, makes a daily output of about 150 tons, which keeps their 75 stamps busy. Emil Sanger, Supt. and manager of this company, has just returned from quite an extended trip in the East. The Silver King M. & M. Co. are running their 20 stamps steady with ore extracted from their various mines in Calico. This company has resumed work on the Silver Odessa mine, with Wallace Corbett as foreman. Some very rich ore has been taken out of this mine lately by chloriders. At the Bismark and Humburg mine, chloriders have sunk through what was generally considered the bedrock in this part of Calico, namely, sandstone, and at both mines have struck some very rich ore. J. B. Stebbins is making preparations to erect a five-stamp mill in the place of the Barber mill, which was burned to the ground a few months ago. The Alvord mine, near Camp Cady, is doing steady work, and from latest reports is looking well.

San Diego.

TIN ORE.—*San Diego*, Sept. 10: Warner Wheatley has discovered a tin mine in San Diego county. The mine is located 65 miles from this city and somewhere "within sight of Salton lake," but that does not say exactly where. Some time ago Mr. Wheatley brought in some sample ore from the mine and showed it to Dr. Eames. The Doctor liked the looks of it and sent some of the ore to New York to be reduced and analyzed. The result was handsome. The analysis showed the sample to be 56.25 pure tin, an almost marvelous percentage when compared with the Cornwall mines, which show but 1.4 per cent tin, and good when compared with Temescal tin, which the richest ore shows but 65 per cent and the average is 15 per cent. Dr. Eames' son will in a few days go out to look at the extent of the deposit.

SOME RICH STRIKES.—*Julian Sentinel*, Sept. 10: The past week has been a red-letter one with our miners, and among our mines all along the line from Julian to Banner, there is the echo of new finds. The first to open the hall was the Cincinnati Belle, with a wide ledge of magnificent ore and no end of it yet in sight. Then the Helvetia people received a reward for their patience and faith by opening up a ledge of the most promising ore seen in the camp for many a day. A report has it that the vein as found is two feet wide and still increasing, some of the rock being so heavily flaked with gold as to make it possible to work it up into jewelry. The Ruby mine has passed into the hands of a well organized company, of whom there are several San Francisco men of capital. The company will be known as the Ruby Mining and Milling Co., and this fine property will be pushed now with unremitting energy. The boys at the Warlock have a splendid vein in sight. There is pay rock nearly four feet in width. The ore will average \$50 to the ton at the lowest figure, and the three who have the mine under lease are taking out each a ton a day. Fifty dollars a day to the man is not had for wages. They have 40 tons of ore on the dump that will soon be put through the Banner mill.

Siskiyou

BLUE GRAVEL.—*Yreka Journal*, Sept. 9: Lee, Lash & Co. are going down deeper with their shaft and drifting at the Greenhorn blue gravel mine, so as to make sure of draining the lowest portion of the pay channel, a very good precaution, as it may save making a deeper drift afterward. As soon as the drift is extended to the pay channel near the new shaft, they will again commence taking out rich pay in good quantity. The shaft of the Yreka blue gravel mine on the east side of Yreka creek, is now down about 100 feet, with gravel of same nature as during past two or three weeks, being of a heavy cement-like character similar to the Greenhorn blue gravel mine. The miners seem to feel confident that they are nearing bedrock, where good pay will no doubt be realized. The hydraulic and placer miners are commencing to fix up for winter work, so as to be well prepared for active operations when the winter storms commence again. The river miners along the Klamath are taking out pay gravel with good success lately and will continue to do so still better until the cold weather and winter storms interfere.

Tulare.

BALD MOUNTAIN.—*Porterville Enterprise*, Sept. 11: Many years ago D. B. James located in the little town of Tail Holt, and being something of a mineralogist, discovered that the neighborhood abounded in the precious metal, though in what quantities he was unable to determine. He delved and dug, and made so successful an examination that he erected a 9000 stamping mill of 10-stamp capacity. He opened mine after mine and took out thousands of dollars; but alas, he lost all he made in other ventures of chimerical aspect. Some months ago Mr. James disposed of his interest in all these mines to an English syndicate represented by Mr. Percy A. Thomas, a young gentleman of large experience and considerable foresight. Mr. Thomas experted the property, pronounced it satisfactory, and when an *Enterprise* representative paid a visit to that gentleman a couple of weeks back he found the stamping mill crushing free-milling ore, the Bald Mountain, Eclipse, Mammoth and Keyes mines in full blast. The Bald Mountain mine is situated 2½ miles from Tail Holt in a southeasterly or easterly direction and is the principal mine in the district. At the present writing a tunnel has been bored to

the extent of about 700 feet, while a shaft which is being sunk to admit air to said tunnel is down about 125 feet. Some very fine ore is being taken out, seven tons of which two weeks ago turned out about \$115 worth of the raw metal, averaging about \$16.45 per ton. It is the intention of the company, if everything turns out as satisfactorily as they expect, to develop this mine fully. They will put in more stamping power and batteries, construct a system of wire tramways between the mines and the mill, and otherwise rush things.

NEVADA.

Washoe District.

CON. CAL. & VA. MINE.—*Virginia Chronicle*, Sept. 12: 1100—Have continued retimbering south drift. The crosscut running east from the shaft station has been extended 40 feet; total length, 97 feet, in porphyry and clay with some quartz showing low value. Have continued to extract some ore from the openings on the 1300, 1500 and 1600 levels.

1650 level.—Have continued to extract ore of fair quality from the drift run west from the top of the upraise carried up 59 feet above the southwest drift. Ore of fair quality has been extracted through the drift run east from the winze No. 3 (down 73 feet) in working upward from that point.

1750 level.—In working out and upward from the bottom of winze No. 2, sunk from the 1650 level, we continue to strike ore of fair quality. There has been extracted from all parts of the mine during the week 1018-30 2000 tons of ore, which was shipped to the Morgan mill. The average assay value of all of the ore worked at that mill during the week (980 tons) was \$22.40 per ton. Bullion on hand in assay office, assay value, \$11,000.

OPHIR.—1465 level.—We have extracted and raised to the surface 20 tons of ore, the average assay value of which is about \$22 per ton.

MEXICAN.—On the 1465 level the south drift started from the east crosscut No. 1, at a point 618 feet in from the main north lateral drift has been advanced 27 feet; total length, 265 feet, in a hard porphyry formation showing clay separations.

UNION CON.—From the east crosscut No. 2 on the 1465 level, at a point 1070 feet from the main north lateral drift, the north drift. No. 2, has been advanced 22 feet; total length, 44 feet, in vein porphyry, which carries a low assay value.

GOULD & CURRY.—200 level.—Main south drift has been advanced 30 feet, through soft porphyry, streaks of clay and quartz. East crosscut No. 2, 65 feet above 200 level, has been extended 15 feet; total 43 feet, face in porphyry and quartz, showing some value. West crosscut, No. 2, opposite east crosscut, has been advanced 15 feet; total, 41 feet. The last eight feet passed through is in quartz showing some value.

BEST & BELCHER.—1100 level.—East crosscut, No. 1, has been advanced 23 feet; total, 80 feet; face in soft porphyry.

EXCHEQUER.—The joint south drift from the 1800 station of the Ward shaft is out 344 feet; the face is in porphyry.

CHOLLAR.—Extracted and sent to the mill the past week 359 tons of ore; average battery assay, \$16.08.

POTOSI.—The north and south lateral drifts from the winze station, 1400 level, are each out 36 feet in porphyry. Are opening a station at the 1500 level of the winze.

WARD COMBINATION SHAFT.—The joint southwest drift from the shaft, 1800 level, is out 344 feet; face in porphyry.

SILVER HILL.—The northwest drift, 50 level, is out from the shaft 250 feet; the face is in quartz and porphyry.

BULLION.—The southwest drift from the Ward shaft, 1800 station, is out 344 feet; the face is in porphyry.

CON. NEW YORK.—The west crosscut, 230 level north of shaft, 650 level, is out 52 feet; face in quartz assaying from \$15 to \$30. The north lateral drift, 1100 level, is out north of shaft 688 feet; face mostly in quartz yielding low assays.

UNION SHAFT.—The west drift from the shaft, 900 level, has a total distance west of shaft of 1060 feet; the face is in clay and porphyry.

UTAH.—The southeast drift has been extended 38 feet; total, 293 feet; being in porphyry, clay and quartz, the formation of low assay value.

SIERRA NEVADA.—The Kenosha tunnel has been advanced 28 feet; total length, 872 feet; the face is in porphyry.

NORTH GOULD & CURRY.—Last Monday we started work at the North Gould & Curry mine through the East B. & B. shaft. There is some water in the shaft, and it will take some time before we can get at the new drift running into the North Gould & Curry ground.

OCCIDENTAL.—Have extracted and sent to the mill from all parts of the mine 304 tons of ore of the average value of \$17.90 a ton. The stopes above the 650 level is showing a better grade of ore, the average assays being \$21.

Tuscarora District.

NAVAJO.—*Times-Review*, Sept. 11: Everything in and about the mine is working nicely, the stopes continue without material change.

NORTH COMMONWEALTH.—Second level.—No. 2 west crosscut extended 11 feet and raise started to open up ore cut by joint raise. Third level.—No. 2 joint raise extended 21 feet, cutting seam of good grade ore. Drift has been started south following the ore.

DEL MONTE.—Joint raise from third level extended 21 feet, cutting a seam of fair-grade ore. No. 1 north drift, same level, advanced 15 feet in the vein. North drift from east crosscut extended 13 feet, and crosscut from end of drift extended 16 feet, still in vein matter.

COMMONWEALTH.—Fourth level.—North drift from the bottom of No. 1 winze has been run 17 feet, face in vein showing some mineral. Raise from east crosscut through vein 33 feet, showing seams and bunches of good ore, assaying \$60 to \$270 per ton. Have started north drift from top of raise.

NORTH BELLE ISLE.—North drift from the south line crosscut, 400 foot level, extended 14 feet, showing some very nice ore which promises further improvement. No. 1 upraise from this drift extended 18 feet, vein larger but not so rich.

BELLE ISLE.—Line crosscut, 350-foot level, extended 20 feet, the rock is looking very favorable for ore. South drift from the same crosscut advanced 11 feet, the vein is growing wider, ore very

rich. North intermediate drift from the winze below the 450-foot level is in 14 feet and showing fine ore. South intermediate, same place, is in 11 feet. Line crosscut, 450 foot level, extended 14 feet, looking very favorable.

Aurora District.

PROSPECTORS.—Walker *Lake Bulletin*, Sept. 2: Mr. J. Huelat from Aurora reports that E. T. Greeley of the Prospectus mine is doing well. He has extracted about 600 tons of good ore, which has been shipped to the Del Monte mill. The mill will start up in a few days and if the ore pays, work will be pushed vigorously in the mine. John Fleming is hauling 300 cords of wood to the mill, and the people who have stayed with the old camp are very hopeful of the future. Five men are working the old Esmeralda, and the prospects are very encouraging. Supt. Scrutton says that he will increase the force if ore of good grade is encountered. Efforts are being made to induce capitalists to take hold of the John Neidy mine. A large body of good ore is known to exist in this mine, which, would, no doubt, yield a big return for money invested.

Montgomery District.

GOLD ORE.—Belmont *Courier*, Aug. 29: Reports from the gold mines situated in the southern part of Nye county are very encouraging. The work of development is being pushed ahead vigorously, and the indications for striking large bodies of good ore are excellent. Speaking of that section of our county, the Carson *Tribune* says: "Surveyor-General Jones received last Thursday a quantity of pay ore from the Chispa mine in Montgomery district. It was discovered by Mr. Montgomery and has been thoroughly prospected. A ledge fully developed, and from 2 to 14 feet wide, contains ore which works from \$18 to \$30 to the ton, and the chances are greatly in favor of finding very much richer ore. A ten-stamp mill is in course of construction and work will be vigorously pushed. The property is in Nye county in the vicinity of Death valley."

Jackrabbit District.

THE DAY MINE.—Pioche *Record*, Sept. 5: What is called the Junction tunnel is now in 130 feet, following the ledge which at this point contains but little ore. The winze sunk on the ore body 70 feet from the mouth of the tunnel is now down about 40 feet and is all in ore which is soft, easily mined and which averages 35 ounces in silver per ton and 40 per cent lead. The work is prosecuted by means of a small compressed air engine which is supplied with power from the compressor at the mouth of the old working tunnel. Exploration work has been resumed on the West Vein, the full extent of which is not yet ascertained, and some rich ore is being taken from it.

ARIZONA.

CUSTOM ORE.—Mohave *Miner*, Sept. 10: Messrs. Eames and Biddell, of the Empire mill, came from California this morning. They will put the mill in order and start up on custom ore right away. The last run of the mill was quite successful and the experiments made then will be of great benefit to the management hereafter.

THE MUSIC MOUNTAIN M. Co. is pushing work on their mine. The shaft has been cleaned of the debris left by careless chloriders, and newly timbered below the 70-foot level. Levels will be started near the bottom and as soon as possible a force of miners will be put on stoping. At present there is barely enough to run the mill one-third of the time, but it is thought that an abundant supply can be obtained by opening up the spring. The mill runs thus far have been very satisfactory, and no difficulty will be experienced in getting sufficient ore to keep it running to its full capacity.

WEAVER.—Del Bebe went out to Weaver district last Sunday. He says that the Edith mine has immense quantities of ore in sight and that a new road is being built to the Colorado river, a distance of eight miles. A 15-stamp mill will be put upon the bank of the river as soon as possible. The ore is all free gold and a 15-stamp mill will crush about 50 tons every 24 hours. Monaghan & Murphy, of the Needles, and Henry Brown, of Weaver, are the lucky owners of the properties.

CHLORIDE.—We learn that a big strike has been made in the Distaff mine at Chloride. A streak of pure black metal has been encountered that will run up in the thousands. The Denver M. & M. Co., who has the property under bond, has found in it one of the bonanzas rarely found in a lifetime.

CLOSING OF THE CONGRESS MILL.—*Journal-Miner*, Sept. 2: Rumors of various sorts have been afloat during the past few days concerning the closing down of the Congress mill, so that the *Journal-Miner* man called on Superintendent Murphy to-day and asked him concerning the truth of such rumors. "Yes," said Mr. Murphy, "I have given orders to close the mill down. The reason for doing so is that the construction of the S. F. & P. & P. railroad is now an assured fact, and, as is well known, the Congress Mining Company is financially fixed so that it is not only not obliged to run its mill, but is assisting financially in the construction of this road. The building of the road means a saving to the company in transportation from \$75,000 to 100,000 per year, an item certainly worth saving. The mine is looking better to-day," continued Mr. Murphy, "than it has at any time since work was commenced on it, and while of necessity the working force will be reduced some, work will be continued in the mine until all facilities at our command for the storage of ore have been exhausted or until the mill starts up again. The freighting outfits have also been reduced, but there are enough concentrates and ore on hand now to keep a few teams employed probably all of next month. We will close the mill with several months' supplies of all kinds on hand, and within six months of the completion of the railroad to the mine, it will be started up again, and the product stored until the road is completed there."

BRITISH COLUMBIA.

THE UPPER COUNTRY.—Nelson *Miner*, Sept. 1: The outlook for the upper country is becoming brighter. Illecillewaet is reported quite lively. Revelstoke is to become a lumbering as well as a smelting center. The snowsheds in the Selkirk are sound and as solid as the day they were put in. Donald is lively. The ore in the Monarch mine at Field is becoming less refractory. The Lanark

mine near Illecillewaet is said to be looking fine, the ore body being over 60 feet in extent and no walls visible. Archie McKinnon has bonded his Maple Leaf for \$50,000, with a cash deposit. The San Juan claim is reported sold at figures close to \$40,000. The Corbin & Kennedy claims on the east fork of the Illecillewaet are being examined by the representatives of an English syndicate, and are quite likely to change hands at a figure said to be \$200,000. Over on Fish creek better days are dawning, even the Dunvegan, is likely to turn out to be a big property. A strike of good galena ore is reported being made by Pete Walker and Tom Downs at a point on the Lardeaux about three miles from Trout Lake.

A FIND MADE ON SALMON RIVER.—Instead of going through to the Priest Lake country in Idaho. Jack Buchanan, Mike Landrigan, C. M. Gething, and Bill Springer wandered over to the east of the Salmon, and prospected a section that lies about 20 miles southeast of Toad mountain. They found what they were looking for and returned to Nelson the fore part of the week to see if it was really as good as it looked. Ellis, the assayer, made three assays; one yielded \$286 in silver, \$3 in gold, and 20 per cent lead; another, \$103 in silver and 34 per cent lead; and another, \$3 in silver and \$12 in gold to the ton. They claim the ledge is in place and of good width.

KASLO CREEK.—The Kaslo creek excitement continues. George Keeler and M. C. Monaghan returned to Nelson the latter end of the week and report making five locations. They say the mineral belt extends for several miles and that a number of locations have been made at the head of the Slokan, which is some 15 miles west of Kontenay lake. The mountains are reported high with grass-covered slopes on one side and precipitous broken ridges on the other. There is still a great depth of snow in places.

COLORADO.

LITTLE ANNIE.—Aspen *Times*, Sept. 8: Several months ago, John W. Atkinson and John Holbrook sold an option on 232,500 shares of stock in the Little Annie Mining Company to B. Clark Wheeler at 25 cents a share, and several days ago the sale was consummated, and \$14,000 paid with time and interest on the balance. This will give Mr. Atkinson the snug sum of \$50,000 for his tenth of the stock of the company, or at the rate of half a million dollars for the property before the Richmond, Iron and Eclipse claims were conveyed to the company. Now Mr. Wheeler is selling 100,000 shares of his stock at 30 cents a share after conveying to the company those three claims which, together with the Little Annie, Eureka and Judy, gives the company six claims, covering nearly 2000 feet of the apex of the great mineral contact at a point which contains one of the most extensive ore chutes in the country.

THE GRAND UNION CONSOLIDATED.—Hon. E. P. Cowen of Dallas, Texas, president of the Grand Union Consolidated Mining Company, is visiting Aspen, and is arranging, in connection with Major A. J. Pickrell, manager, to push the work on the company's 70 acres of patented property in Conundrum gulch. The company has 300,000 shares of stock in the treasury for working purposes. Good shipping ore is already developed in several veins on the property. Only about 50 feet more work in the 700-foot tunnel will cut one of the richest and strongest veins on the group, and the work will be pushed forward. The group also contains the extension of the great Cummings lode, which will be developed in the near future.

THE MOLLIE GIBSON COMPANY was sampling some of its rich ore at Taylor & Brunton's yesterday. Great chunks of native silver glistened as the great jaws of the crusher masticated it into a fineness for sampling. Ore has been struck in the Howard Russell, one of the Climax group. The formation and character of the ore are similar to the Little Annie. The property is owned by Cowenhoven & Brown, Al Hopely, ex-Mayor Reese and B. Clark Wheeler, and is being worked under lease and bond by Charlie Miller and Mr. Reese.

NEW MEXICO.

AT BURRO.—Silver City *Enterprise*, Sept. 11: Capt. Fitzsimmons, Supt. of the Hobson mines at Alhambra and the Eckles mines in the Burro mountains, came in Wednesday and reports prospects at both mines very favorable. He promised detailed accounts of development work on these properties on his next visit to Silver city. Hank Dorsey and Willis James are taking out high-grade ore from the Moonlight claim at Bald Mountain. The mine is owned by Mayor Fleming and Hank Dorsey; over 200 tons of ore is now on the dump and hauling will be commenced next Monday. The ore will be worked by Milstead & Co., at the Bremen mill. If all the miners in this section who have mines with pay ore in sight would expend their muscle in polishing a drill instead of wagging their tongues about the merits of their mines, they would not only demonstrate the value of the mine, but money would be more plentiful in their own and everyone else's pockets. Now that you have facility for milling your ore, stop blowing about your mine and work it. Dig up or shut up. The Mitchell M. Co., on the Mangus, while working along very quietly, has been meeting with extraordinary success in the shape of very high grade ore extracted from the mine. Good ore bodies running from \$200 to \$250 per ton have been worked and the ore milled during the past two months. Large quantities of the same grade of ore still show in sight in this mine. This property is conducted on the noiseless plan, and, like several other such properties in this vicinity, is paying its owners handsome profits.

SHIPPING ORE.—*Southwest Sentinel*, Sept. 10: Chas. Shannon is shipping ore from the Hughes & Shannon mine, which is believed to be the best copper property in the Clifton district.

THE AZTEC MINING CO. now keeps five eight-horse teams constantly on the road hauling down about 30 tons of ore a day from its mines at Pinos Altos to its mill here. Development on these mines is kept well ahead of the stoping all the time. The first shipment of amalgam from the Rain-in-the-Face mill under its new management came in yesterday. It was a small one, being the result of only a few hours' run; but it demonstrated in the most favorable and conclusive way what may be expected from this mill under efficient working. Another small

shipment from another mill came in about the same time.

THE TOTAL SHIPMENTS of ore, concentrates and bullion by freight and express out of Silver City during August were 35 per cent less in bulk than the shipments in July, although there was an increase of \$7895 worth of gold bullion and of 10,189 pounds of base copper and 80,000 pounds of copper ore. July, however, was an exceptionally big month, and the August shipments just equaled the June output in bulk, while the bullion shipments have been quietly and steadily increasing. The figures for August are as follows: Copper in bars, 30,221 lbs.; copper ore, 80,000 lbs.; high-grade gold and silver ores in sacks, 39,230 lbs.; lead ore, 280,000 lbs.; concentrates, 441,000 lbs.; iron ore 3,300,000 lbs.; gold dust and bullion, \$24,168. Owing to part of its new pump having gone astray in shipment here, the Silver City M. & M. Co. was unable to get the Bremen mill started up as soon as expected. Duplicates of the missing parts have been shipped and are now on their way here. The company expects to have the mill ready for operating on custom ores by next Monday. Teams were put to work hauling in ore from the Monarch and Copper Point mines to this mill yesterday. To-day freighters begin bringing in 300 tons of ore from the Good Luck at Lone Mountain for treatment.

DAKOTA.

AN IMPORTANT UNDERTAKING.—Deadwood *Pioneer*, Sept. 8: The statements recently published by the Homestake and Deadwood-Terra Mining Companies have opened the eyes of mining men. They show that for the past year the Homestake ore has only run \$3.60 a ton, while the Deadwood-Terra only goes \$1.40, yet the former has paid ten-cent dividends every month, and has a surplus of \$120,000, while the latter has piled up a surplus of \$300,000 and is paying five-cent dividends every month. The success of these mines in making low-grade ores pay has stimulated others, and a movement is now on foot, headed by the leading men of the Black Hills, to erect an immense custom mill at some point that is reached by railroad connections, and can furnish sufficient water power to run the mill. At present, B. H. Pourche is the point that offers the most favorable opportunities, having a large water power, and being connected with the free gold belt by a full railway system. There are immense bodies of low-grade gold ores in the vicinity of Central, some vertical veins and some flat cement deposits. A most painstaking examination of these has been made, and they were found to average \$1.90 per ton. The cost of mining, milling and transportation is estimated at \$1 a ton, leaving a profit of 90 cents. The intention is to have 2000 stamps working on this ore, crushing 3000 tons daily. It takes but little thought to see what immense benefit such an undertaking would be to the country, giving employment as it would to about 2000 men. A strong effort is being made to enlist Eastern capital in the scheme, and the promoters are sanguine of their success.

OREGON.

AT ROCK CREEK.—*Bedrock Democrat*, Sept. 9: Mr. C. M. Foster, who is of many years' practical mining experience, stated that the Chloride is making a splendid showing. The company has a force of 12 miners at work and the force will be increased in a few days. A new tunnel, to be 120 feet in length, has been commenced, which will tap the vein at a depth of 340 feet. When the vein is reached they will run both ways and drift all winter. Mr. Foster says the Chloride vein will average about six feet in width, and will go from 50 to 200 ounces of silver to the ton. Work is also progressing on the Forest City, owned by Dr. Fehrenbach and others of Portland, and a splendid showing is being made. Mr. Foster speaks in favorable terms of the mining outlook of Rock Creek district and predicts a grand future for that section.

THE JAY GOULD.—A *Democrat* reporter yesterday met W. H. Spagha, one of the owners of the Jay Gould, a promising mining property situated in the Pocahontas district. The gentleman stated that the mine has been undergoing extensive development for the past few months, and that the vein, which is of good width, is showing up in fine shape. Three cuts have been run on the property, and a 70-foot tunnel, which will tap the ledge at a depth of 50 feet, is now being run. Mr. Spagha informed the reporter that the five-stamp mill is about completed, and that within 10 days the stamps will begin dropping on the Jay Gould ore. There are 50 tons of ore on the dump, which will go over \$40 in free gold to the ton. The owners of this property are W. H. Spagha, A. E. Birdsall, John Lew and Messrs. Chadd and Macy.

UTAH.

CRESCENT.—Park *Record*, Sept. 12: The Crescent is destined to be one of the greatest mines in the West. There is a great improvement in the ore body on the 200 level since last spring, it being larger and containing much better ore in general, besides which the first-class ore is more numerous and richer. Mr. Hickey, the genial foreman, has this level in excellent shape and the ore is handled with greater ease and much more rapidly. Prospecting is also going forward rapidly and the vein is being uncovered both on its strike and dip, and much stoping ground is consequently being added. While the 300 level was not visited, the *Record* man was informed that it was looking very well and showed a general improvement both as regards the permanency of the vein and the quality of the ore. The Crescent is in good hands, and Supt. McGregor will yet bring the property to that stage when dividends will be the order of the day.

SILVER KEY.—The lessees of the Silver Key have cut through the low-grade body of ore mentioned in last week's *Record* for a distance of 25 feet, and still the foot-wall has not been reached. The ore runs 12.60 ounces in silver and 8 per cent lead and can be concentrated. With a backing of good ore, and the Silver Key has a rich vein in the old works, this immense body of low-grade rock will be a fortune. With modern appliances for concentrating ore, this huge vein should be made a rich producer. The tunnel is still being driven ahead. The starting of a three-compartment shaft on the Daly West, the rumored rich strike in the Meers group and the operations going forward in the Black Diamond and

Nimrod, are attracting considerable attention to that section of Utah mining district and creating considerable speculation as to what the results are going to be.

WASHINGTON.

IVANHOE.—Okanogan *Outlook*, Sept. 12: James Laraway came down from the Ivanhoe yesterday and reports work progressing favorably on this bonanza property. J. A. Nagle of Wilkesbarre, Pennsylvania, passed through our city last week en route for home, where he will remain this winter. While in Okanogan county, Mr. Nagle secured some very good mining interests, including a new location of great promise in the Wanicut district. The ledge is about 20 feet wide and carries both silver and gold. J. W. Shull has a force of men at work on a new location up near the head of Salmon creek. The ledge is 2½ feet wide, and assays as high as \$600 per ton in silver. Ed Harvey and H. J. Miller have finished their contract on the Buckhorn and Frankie Boy claims and moved down from Mineral Hill Wednesday. The Buckhorn ledge has improved greatly; during the last ten feet the boys run in the tunnel. They brought down some fine specimens of ore, showing gray copper and brittle silver.

LOOMISTON.—Okanogan *Outlook*, Sept. 5: The latest and liveliest camp in Okanogan county is that which has recently sprung up at the foot of Palmer and close to the War Eagle and Black Bear mines. Three months ago Loomis & Co., with their store, residence and lodging-house were the only inhabitants of the place. To-day there are from 15 to 20 buildings either completed or in course of construction and a community of from 150 to 200 persons are actively engaged in the work of building up a town and making homes. This change of affairs is due directly to the efforts of that enterprising and energetic gentleman, S. I. Silverman, in putting up here the first quartz mill ever built in Okanogan county and which is now operating with such gratifying success on the ore of the War Eagle and Black Bear mines. The mill started up on the 20th of July, and has been in operation about six weeks. As near as we are able to learn, it has produced in that time upward of \$10,000 in free gold. The concentrates, we are informed, represent about one-quarter of the value of the ore, which would add \$3000 more, making a total of about \$13,000 as the net proceeds of the mill on a six weeks' run.

Mining Share Market.

The way in which mining shares are being manipulated is a continued source of surprise, for hardly does the nimble chipper begin to master the true inwardness of the moves than a change is made, which again leaves him at sea. This week there has been a steady but quiet increase in the quotations for the North End stocks and a decidedly firmer tone, with fluctuations in the Gold Hills, while the Middle were seemingly left without a father. What will be the next change in the manipulation is a conundrum, and the persons who guess it correctly will do exceedingly well. So far the writer can learn, the more successful outside operators look for quite a setback soon. What they base this opinion on is more than can be learned, unless it be that no deal has been a continuous up move until top prices have been reached. There is no denying but usually well-informed persons do not look for much ore to be shown up on the present deal, for they expect it to be of an all cry and no wool character. It is a notable feature of the present move in stocks that several of the more successful monied operators are "noisy" around. They usually come out of their hiding places when an opportunity presents itself of making quite a turn in the market, either as bulls or bears, or as both, by turns.

In outside shares slightly more attention appears to be given to the Tuscaroras and Bodies. The increasing interest in the mining shares of these two districts is said to be largely due to the growing importance of the work, and also to the belief that the stocks are fairly well concentrated and that if inside holders do not make a deal soon, it will be hard to get one up before next spring. There is said to be considerable ore taken out of several of the Tuscarora mines, and which can be so milled as to foster a slight boom. From the Bodies the advices are of a still more encouraging character. In Bulwer another crosscut is under way to cut the rich ore found near the Standard line, and if they succeed in striking it, there will be no disputing it belongs to the mine. The Standard mine continues to turn out its regular quota of bullion. It was contemplated to start up the Bodie mill on either Bulwer or Bodie ore (both mines are reported to have considerable rich ore on their respective dumps), but for some reason it was deferred, probably to allow of the surplus funds being used up which would admit of assessing the stocks, by which they would frighten outsiders into selling. The work going on in the Bodie mine is of a very interesting and important character. Ore, it is said, is being taken out which ought to pay dividends, while it is claimed that there is every encouragement for believing that one of those blind, but very rich, pockets may be struck at any time. Secret work with this object in view, it is reported, is being done on a level which the superintendent evidently forgets to mention in his official letter.

This (Thursday) morning mining shares opened dull but strong. There is a general belief among well-informed brokers that there is a line of shorts on the market, principally on the North End stocks.

The news from the Comstock mines does not justify the assertion made by some that the pool will show up any new development of ore this year, but, on the contrary, everything warrants that the work is not only to kill time, but get the mines into still better condition for next spring's deal. While saying this, the fact must not be lost sight of that a good sized deal can be made this year without much showing of ore. There is a large amount of secret work going on in several of the mines, of which it is difficult to get particulars as yet. The pool has succeeded most admirably in getting miners who know nothing after getting of the mines, so that they might as well be deaf dumb and blind so far as they are of benefit to outsiders. An improvement is reported in Ophir; in Sierra Nevada they are in vein material, while good news continues to be received from the middle mines. Within the next 90 days very important work ought to be inaugurated in the Gold Hill group.

MECHANICAL PROGRESS.

Why Ball-Bearings are not Used in Machinery.

The plain, unadorned reason is that such bearings are much inferior to what are termed parallel bearings for all horizontal shafts.

A shaft or journal being true, properly finished and running within, or having run upon it a cylindrical "box" or "quill" which is also true and correctly fitted, and having between the two surfaces some oleaginous substances, as oil, plumago or grease uniformly supplied, is, so far as the world's experience to date, the ideal form of bearing.

It is important in such bearings that the two surfaces should be of dissimilar material. To obtain the highest results one of them (preferably the shaft) should be as hard as is consistent with strength, and the other should be of a somewhat softer material, though some of the best bearings ever made have had both surfaces hardened. This, however, calls for better workmanship and more thorough lubrication.

There are a few cases apart from cycles where the ball-bearings may be said to have advantages, as, for instance, heavy turrets or domes for astronomical observatories. In such cases the plane of rotation being horizontal, the weight is taken by all of the balls at once, while in the case of a horizontal shaft the load is borne by only a small portion of the balls at one time, and even then, if one ball is larger than the others, that one will have all of the responsibility while it is passing the "tight" side.

In these large slow-moving vertical bearings the balls may be so placed as not to rub against each other, which is a matter of no small importance. Again there are cases where the weight of a vertical shaft is supported by a "collar," so that the bearing surface must be at a distance from the center. This may sometimes be best accomplished by means of a properly proportioned ball-bearing, especially if the weight and speed are not excessive.

In bearings requiring rigidity and accuracy, as lathe spindles, the balls have been often tried, but such lathes are not in favor. This state of things could be helped materially if it were possible to make absolutely round balls, but that has never been done, though the manufacture of balls has been very much improved within the last few years.

Much more would no doubt be done toward overcoming the weakness of the ball-bearing for machinery if there were any advantages in it, even in a more nearly perfect form.

The excuse that exists for the ball bearing in bicycles is not valid anywhere else, and it is not an unmixed blessing even there. But two claims are made for it, viz., ease of running and the quality of being adjustable. As to the first, it simply isn't true, as any practical man knows if he has investigated the subject (and if he hasn't his opinion doesn't count). In making this statement I am assuming that the bearings are clean and properly oiled, for I readily admit that ball-bearing will run with more dirt and less oil than will the other kind, and when you have allowed the dirt to supersede the oil for a certain length of time, you may get a new bearing in either "case".

Except in some special cases, the ball-bearing is a decided disadvantage in machinery, to say nothing of its first cost. The parallel bearing being neater, stronger, smaller, cheaper, safer, and infinitely more durable, it naturally stands as a monument to that great and unget-overable fact, "the survival of the fittest," and I am willing to go on record as saying that it will stand.—*Cor. Wheel and Cycling Review.*

THE FATIGUE OF METALS.—With respect to statements that occasionally appear on the subject of the fatigue of metals under long-continued stress, a report that has recently been published regarding two similar suspension bridge links, is worthy of notice. A square iron link, 12 inches wide, 1 inch thick, and about 12 feet long, was taken from a bridge, then about 40 years old, and tested against a similar link which had lain unused in store ever since the building of the bridge. The means of comparison were, therefore, excellent, and the result should go a long way to show whether or not iron really does lose any of its strength in prolonged service. The effect of the tests was to determine for the old, used link an ultimate tensile strength of 21.8 tons per square inch, an elastic limit of 11.1 tons per square inch, an elongation of 14.05 per cent, and a contraction of 17.35 per cent at the point of fracture. For the unused link, the tensile strength was found to be 22.2 tons per square inch, with an elastic limit of 11.9 tons, and elongation and contraction at fracture of 18.42 per cent and 18.75 per cent respectively. The two pieces of iron were, therefore, of practically identical strength, the small difference actually observed being well within the ordinary range of variability of similar pieces of the same metal.—*London Iron.*

A MUCH NEEDED INVENTION is announced by Machinery of London, which consists of a device for automatically shutting off the gas when it has been blown out instead of being turned off in the usual way. The principle upon which the invention is based is the expansion and contraction of a metallic loop made of German silver and steel and which is adjusted very close to the gas flame. One end

of the loop is free, while the other is secured to the fixture. A valve controlling the gas is attached to the free end, and when the gas is burning the valve is open and the gas freely escapes. If, however, the gas is blown out, the loop will quickly cool and contract, and the valve will shut off the gas. It is said that the device is exceedingly simple and it responds quickly to the change in temperature.

A USEFUL INVENTION.—One of the most ingenious, and at the same time practically useful among the automatic machines which have been introduced of late, is a device which forms, fills, weighs and seals packages in those establishments where large quantities of goods, such as fine-cut tobacco, soda, starch, etc., are constantly put up. The operation by which this result is accomplished, though decidedly novel, is not at all complex in any particular, the machine consisting merely of a series of forming blocks, receptacles, folders, gammers and feeders, all working in mutual harmony, so that packages are smoothly and continuously produced. The forming blocks successively size the paper, which instantly afterward is wrapped around them, folded and gummed at the end; the paper sacks are then plunged into receptacles filled with the commodity for which they are intended, finally folded on top and sealed.—*N. Y. Sun.*

A CONVICT'S INVENTION.—A press report from Boston states that John E. Foster, a convict now serving a 25-year term in prison, in Massachusetts, has invented a new type of marine engine which is attracting much attention from leading mechanics, and will be patented as soon as a model is completed. In his invention no eccentric is used, and the engine was reversed without slackening speed by means of a button, but on a large engine a treadle would be used. The reversing was done so quickly that one could hardly tell that the engine had been reversed. Only three valves are used and they are self-acting. There is no steam chest and no condensed steam can get into the cylinder. He claimed that the engine is more powerful than a Corliss, and there is less expense attending it. The speed is faster than a Corliss or an oscillator. One feature of the engine is that the piston when detached, can be reversed.

A NEW WELDING POWDER.—An excellent powder for welding wrought iron is described by a German contemporary. It consists of borax, 50 per cent; sal ammoniac, 25 per cent; water, 25 per cent. This mixture is boiled, being at the same time continuously stirred until it is reduced to a stiff mass, which is then held over a fire until it becomes hard. When cold, the mixture is well pulverized and assimilated with one-third part of rust-free wrought iron filings. The pieces to be welded are first dovetailed, or otherwise connected; the welding parts are then heated to redness, when the powder is strewn over them and allowed to liquefy over the fire. Only very slight blows are then required to consummate the perfect conjunction of the pieces.

STRENGTH OF ANCHOR BOLTS SET IN PORTLAND CEMENT.—From a number of careful tests lately made to ascertain the precise strength of anchor bolts set in Portland cement in the ordinary way, the fact appeared that the joint was really stronger than the stone. In this demonstration, two-inch iron rods were set into the stones some 11½ inches, and then subjected to the test. The first rod had a screw thread to improve the grip of the cement, and the cement began to yield at a load of 32,000 pounds, the breaking of the stone taking place at 50,000 pounds. With a plain, smooth rod, it was found that the cement began to yield at a load of 34,000 pounds, but the rock broke at 67,000 pounds.

SUPERIORITY OF AMERICAN FIELD GUNS.—The new field guns turned out at the Watervliet arsenal for the army are demonstrating their superiority to anything of equal caliber that Krupp can show. The battery of four pieces of 3.2 inches caliber, tried by Light Battery F, Third Artillery, on the banks of the Guadalquivir river, could send shells a distance of five miles, and the extreme range with accuracy was probably not far from 2½ miles. The remarkable unanimity with which the shells pitched practically into the same spot when fired at the target was proof of the exactitude to which gunnery has been reduced.

THE WEAR OF STEEL RAILS.—A Belgian statistician has compiled some figures on the subject of the wear of steel rails, according to which, under normal conditions, every geographical mile of railway track loses two and one-fifth pounds by the passage over it of each train. As the length of the permanent ways on the globe amounts to nearly 60,000 miles, it follows, if a daily average of ten trains be taken, that the total loss suffered each day by the metallic rails of the earth will be about 600 tons.

AN IMPROVED WELDING PROCESS.—From Chicago comes the news of a new process of welding, which is performed by simple friction. The pieces of metal which are to be joined together are placed in a lathe and rapidly rotated. At the point of junction the ends are pressed into a die, thus giving the pieces the desired shape. The high temperature necessary to perform the welding is, it is said, the result of the rapid movements of the pieces under pressure.

SCIENTIFIC PROGRESS.

Peculiarities of Tornadoes.

The tornado which wrought such destruction at and near the town of Mexico, Missouri, on the 20th of May last, has probably been more accurately studied than any other which ever occurred. The speed of its forward movement was accurately determined by the difference in time at which it struck and broke a line of telegraph wire at two different localities, 28 miles distant from each other. It was 27 minutes in traversing that distance. The tornado's general route was more direct than that of the wire; but its zigzag course just about made the difference equal. During its passage, its gyrating force and velocity was terrific. Its roar at one point, when it rose at a great distance above the earth and among some low-lying clouds, is said to have been heard at a distance of 25 miles at a right angle from its course.

During its greatest fury, the center of the disturbance was marked by a white steamy streak, about a foot in apparent diameter, which swayed to and fro, and at times parted in the middle, the upper portion slowly rising and passing slowly out of sight. The funnel cloud, when simply traveling, was dark, but when it encountered any tall obstacle, where work was to be done, the white streak appeared and touched with its point the object, with the delicacy of a serpent's tongue, but at the same time with a force which sent everything movable whirling into the air. When it approached any very large obstacle, the cloud seemed to reduce its flight, mass itself together, throw out great filmy, revolving tentacles, which would dart violently out and in, while doing its work of destruction. The electric displays, to the eye, were not more remarkable than is often witnessed in large ordinary storms. Where it passed along with comparative quiet, crisply burned green leaves were afterward observed, indistinct heat, either electrical or frictional.

When passing over level ground, without obstacles in the way, the forward movement was very rapid; but when doing destructive work, it appeared to halt or move more slowly.

The average course of the tornado was west; but it zigzagged to the north and south, whenever any obstacle like a house or barn or trees appeared at a distance of a mile or less from its direct course. In one instance, after destroying a house, the cloud divided—one portion going directly west about half a mile, and parallel to its general course, where it did its work of wrecking a house; the other portion moving off in a southwest direction some three-quarters of a mile, where, after unroofing a barn, it turned back northwesterly, and the two united and passed on westward, in a zigzag course, working destruction to all elevated objects along the way. There appears to have been a slight separation and divergence several miles farther on, and then a reunion. The deviations from a straight line were generally about half a mile, the cloud always returning to or passing over the central line of course and again returning.

As we have condensed this description from the *Scientific American*, which gives a diagram of the course of the tornado, showing the different points where houses, barns and trees were attacked. The diagram shows nine points where the tornado crossed a line drawn due east and west, and at no place it does not appear to have moved from this line over three-quarters of a mile. It crossed a little stream in its course, and objects beyond that point were besmeared with mud, which must have been taken up from the bottom of the stream.

The upward vortex and onward motion of this storm must have continued long after the cloud rose from and ceased its destructive action upon the earth, for objects as large as window sashes were found fully 30 miles distant from the point where the destructive action of the storm disappeared.

Careful observations have shown that the barometer cannot be depended on as a tornado warning. The atmospheric disturbances must be confined within quite a circumscribed area, and without any change in the upper atmosphere. There was very little rain in the immediate vicinity of the center of disturbance, but at quite a distance, hailstones weighing two pounds fell, evidently from a great height. The lumps of ice were of irregular form, but on carefully noting them through, they were found to be formed around a small spherical center. Some of these hailstones penetrated to a depth of 10 and 12 inches into plowed ground.

At one point the path of the storm passed within observing distance of some large factories, from whose furnaces the smoke rose perpendicularly to a great height, where it was suddenly cut off by an upward current flowing toward the storm, the air rushing in to fill a vacuum. In addition to the diagram above referred to, the journal from which we condense gives several engravings, evidently from photographs of the ruins of houses demolished by the tornado. The study of this will no doubt add much to the knowledge which is being accumulated in relation to the causes and phenomena connected with destructive tornadoes.

PRIZE FOR A SMOKE ARRESTER.—It would seem that notwithstanding the great number of valuable devices for preventing the smoke nuisance in cities, even approximate perfection

in this line of invention has not yet been reached; for late European papers announce that the German Government has offered a prize for the best scheme to abate the smoke nuisance in cities. The prize is published as 3000 marks, which is no doubt a mistake, as that would hardly pay for a good essay on the subject. However, it matters not what the prize may be; the result will be the production of something of value. This and kindred subjects are now being thoroughly investigated in Germany, and people will be anxious to hear the result in this case. It is time that more attention was being paid to this matter in San Francisco. Notwithstanding our almost constant westerly winds which blow the smoke and poisonous sewer and other gases into the bay, there is a crying need that more attention should be paid to reducing the useless production of such unhealthy nuisances. The finer the day in this city the more smoke and foul sewer gas we have, and every year adds to the volume and intensity of both.

A STRANGE FEATURE OF MAGNETISM.—The *American Machinist* describes a strange feature in magnetism, which any one possessed of two bar magnets and a small screw can demonstrate for themselves. The feature alluded to is that decreasing the contact surface increases the attractive force of a magnet. This seems hardly credible, but can readily be proved. Take two bar magnets and place on the lower one a common iron screw, head down. In this position the lower magnet has the advantage of gravity to aid in holding the screw, as well as the apparent advantage of the much larger surface of the screw-head, as compared with the point. Now lift the upper magnet from the lower, and it will be found that, contrary to what seems to be a reasonable belief, the screw will be lifted up with the magnet. This is about the simplest test for this strange phenomenon of magnetism. The great contrast in area of points of contact, and the weight of the screw adding to the load to be lifted, makes it about as convincing as even the most skeptical can demand.

A NOVEL TOY HEAT MOTOR has been devised which depends for its action upon the fact that nickel is magnetic at ordinary temperatures, but at 300° C. becomes suddenly non-magnetic. A slip of nickel is attached to a disk of copper suspended by two strings, so that it can swing like a pendulum. On one side of the hanging metals is a magnet, with which the piece of nickel is ordinarily kept in contact and held by it. By placing a gas flame or a spirit lamp underneath the nickel, so as to warm it, it becomes so heated as to lose its magnetism, or power of being magnetized, and falls off, the pendulum thus making a swing. By its passage through the air, the nickel is cooled below the critical point, and on returning is held again by the magnet, only to fall off again as before, and so on with considerable regularity so long as the source of heat is kept up.

A NEW LENS has been devised, the object of which is to throw the rays of electric light in annular concentration, thus making use of its vast illuminating power in a direction to be most available. It dispenses with the use of a shade or concave reflector, and concentrates the light in an annular horizontal zone; but when it is desired to project the light to one side only, and with augmented strength, the inner or concave portion of the lens can have amalgam applied to any part, say half of its surface, more or less. This lens will accomplish what no shade or reflector will do, and it is thought that its strong points of merit will doubtless make it highly popular in the great illumination of the near future.

MEASURING THE HEIGHT OF WAVES.—An apparatus for measuring the mean level of the sea is announced. It is based on the principle that when a liquid wave traverses a capillary tube or a porous partition, its amplitude diminishes, and it is retarded in its phases without the mean level of the wave changing. It consists of a glass tube, the lower end communicating by a flexible pipe with a plunger which is lowered beneath the lowest water level. There are two cells in the plunger, the lower being filled with sand and open to the sea, the result being that the column of water in the tube rises and falls very little with the tides, and the mean sea level can be read from a graduated scale.

PHOTOGRAPHING ANIMAL MOTION.—Scientist Anschütz of Liess, has perfected a set of photographs of a dog in the act of jumping over a small bush. In the act of making one jump the animal was photographed 24 times, and each picture is not a mere silhouette, as was the case with Muybridge's first attempts of this kind, but a little picture showing half-tone and detail.

A NEW SWEDISH GLASS is claimed to have important advantages for microscope and other fine lenses, giving greatly increased power. The chief improvement over other fine glass consists in the addition of phosphate and chlorine, which impart absolute transparency, great hardness and susceptibility of the finest polish.

A HUGE MICROSCOPE.—There has just been completed in Munich a huge microscope, with a magnifying power of 11,000 linear perspective. Electricity is brought into service in the operation of the great instrument, the cost of which is \$8750.

ELECTRICITY.

IMPROVED METHOD OF TRANSMITTING ELECTRICAL ENERGY.—There was a brief reference in our last issue to some experiments which are being made in Europe, looking to an improved method of transmitting electrical energy. On Tuesday last, we received the following note from Mr. Wm. C. Qalby in regard to the matter: Darling the past three months there have been published in the *Electrical World* several notices of the apparatus to be used in transmitting electrical energy over long distances. The system to be employed is one that has been tested in a small way before, and consists in using alternating dynamoes of low potential—say of 2000 volts and 1000 amperes, or 2,000,000 watts. This current is then passed through a converter, which raises the potential to 20,000 volts and reduces the current to 10 amperes. A No. 6 copper wire will carry this current at a small loss for a very long distance. When the current reaches the point where it is to be used it is passed through another converter, which reduces the voltage to any point that may be desired and, as a consequence, increases the current to a proportional number of amperes. The loss by the converters and the line wire need be simply one of electrical resistance and leakage, and in the case under consideration, and say for a distance of 50 miles, would be about 40 per cent; that is to say, you would recover in electrical energy 60 per cent of the power of the engine or water wheel that drives the dynamo.

THE NORTH BEACH AND MISSION LINE.—It is confidently predicted that by May next, the citizens of North Beach will be able to ride either to the foot of Third or to Twenty-Sixth Street in electric cars. Mr. Skelly, the superintendent, says the company is going right ahead with the work of electrifying electricity for horse power. He further says that the company had well nigh completed its arrangements for putting in cables; but the recent favorable reports in regard to the working of electric roads has finally determined the managers to make the change in favor of the latter. Overhead wires will probably be used, as the company secured a franchise for such right over two years ago, and before the recent opposition to such use was set on foot. The franchise is good and cannot be set aside. The cost of the motor plant and cars when ready for operation, will be about one million dollars. Bonds will be issued for raising the money. The poles to be used for suspending the wires will be of the most approved and ornamental pattern. Several designs have been presented by our local foundries, and it is probable that the one submitted by the Eledon Iron Works will be accepted. It is but little larger in diameter than an ordinary lamp-post, which it much resembles in appearance. It is jointed and riveted, and filled with iron shavings, packed in a peculiar manner, to give it great solidity and strength, combined with comparative lightness.

THE STOCKTON ELECTRIC ROAD.—Ex-Congressman James S. Louttit, of Stockton, has consummated a transaction by which the Stockton street railway passes into the possession of a company of San Francisco capitalists, who will replace the present mule-car line with an electric road, having ten miles of double track. The same company which will operate the street railway will probably furnish Stockton with electric light, and will illuminate Goodwater Grove, which will be transformed into a park, especially for evening recreation. About \$15,000 will be expended in sinking a natural gas well, and \$25,000 will be devoted to the improvement of the grove. One terminus of the road will be at the grove and the other end of the line will leave the passengers at Jackson Park, where there are 25 gas wells, one of which produces daily from 90,000 to 100,000 cubic feet of gas. Water which is said to be developed with the gas is said to possess curative qualities, especially beneficial for rheumatic troubles and skin diseases. Swimming baths, into which this water can be turned, will be constructed, and \$460,000 will be expended in Stockton as a result of the investments of San Francisco capitalists.—*Pacific Lumberman.*

THE NEW YANKEE ENTERPRISE.—This is what the *Electrician* of London says of the development of electrical traction in this country: "A large and varied assortment of reasons can readily be marshalled up to account for the rapid development of electric traction in the United States and its analog progress in the United Kingdom. If a reproduction of the results obtained with the electric cars on the Boston West End Railway could be guaranteed on this side of the Atlantic—and we know of no insuperable obstacle—even the most cautious of tramway directors might be induced to emerge from the 'experimental stage.' In Boston, electric traction costs nearly 10 per cent less than horse traction per mile run, and its net earnings amount to over 77 per cent more. Meanwhile, we in this country are still hammering away at battery traction, pending the advent of the perfect closed conduit." Our English cousins need a little Yankee enterprise to wake them up.

THE SURVEY COMPLETED.—The plans and surveys for the Sutter and Yone City electric railroad are completed. This will be one of the most extensive electric

systems yet proposed in this State. The road will be 12 miles in length, connecting with all the principal towns along the mother lode in Amador county. Two surveys have been made both north and south of Sutter creek. The engineers are reticent as to their plans and as to which route is the best. The cost per mile is more than was at first anticipated. No difficulty is anticipated in securing the right of way, whichever route may be selected, for all agree that the road will be of great advantage, not only to property along the road, but to the whole county as well.

THE SAN JOSE ELECTRIC SYSTEM is to be extended a distance of two miles. A franchise has been prepared, and will no doubt be adopted by the Board of Supervisors before this item reaches our readers for an electric road to Oak Hill Cemetery, petitioned for by Jacob Rich, who will extend his first street line to the city of the dead, a distance of two miles. The most important provisions of the franchise provide for the laying of a plank sewer, four by eight feet, in a ditch on the west side of the Monterey road at the expense of Mr. Rich and the property owners along the route; that the sewer shall be covered with earth up to the level of the road and the tracks laid over it. Cars shall be run every half hour and single fares shall not exceed five cents each way.

STREET RAILWAYS. of all classes, are the best paying investments in the country. The *Electrical Age* of New York gives a list of regular quoted prices of 84 street railroads, 53 of which are quoted at or above par. Quite a number are quoted as high as two and several as high as three times their par value. No other industry in the world can make such a showing. These prices, it should be borne in mind, are quoted for New York City. There are probably hundreds of street railroads not registered in New York which are equally as well-paying investments and bring equally high prices in their several localities.

THE PONDROUX BATTERY.—Flavien Pondronx of Paris claims to have solved the long existing problem of a substitute for dynamo in electric lighting by providing a cheap, inodorous, inoffensive electric battery capable of supplying light enough for domestic use." Mr. Pondronx claims that by the construction of this battery he is enabled to employ a great surface of zinc in a cell of moderate capacity containing little liquid. The ingredients of the solution, he adds, are very cheap.

OAKLAND AND PIEDMONT.—It is reported that Theodore Meitz has made arrangements for placing bonds to the amount of \$100,000 on the Alameda, Oakland and Piedmont railway, and will soon begin the equipment of the Santa Clara avenue and Park street lines, Alameda, with electric motors. The Park street road will be built as soon as the bridge is completed, so that the road may be operated to East Oakland.

ELECTRIC OR HORSE.—Messrs. Benj. Morgan, W. C. Upton, Adam Green and W. S. Porter have made application for a railroad franchise along the following streets in Berkeley: From western terminus of Channing Way to Anduhon street, to Dwight Way, to College Way, and thence to town limits. The request is for either horse or electricity. If granted, electricity will undoubtedly be used.

A LESSER LIGHT PREFERRED.—The *Electrical Review* says, in the course of an editorial: "Electric lights in the interior of trolley cars have been objected to by people who ride out of town to get a cool and rapid view of the surrounding country. A company could make its line quite popular with the younger contingent if the lights were extinguished after leaving the city limits."

FROM OAKLAND TO HAYWARDS.—It is reported that the Haywards, San Leandro and Oakland Electric Road Company expects to have the iron and ties on the proposed line of its road within three or four weeks. It will take 13½ miles of iron for the single track. The grading for the fill between San Leandro and Haywards will be finished in a few days.

ELECTRICAL INVESTMENTS.—The *Electrical Age* of New York quotes the price current of no less than 160 companies engaged in various electrical industries, aside from street-car companies. These companies represent a capital of \$380,615,000. Sixteen of these companies are quoted above par, and represent over \$27,000,000 capital.

THE RACE OF IMPROVEMENT.—As showing the tendency of the march of improvement in this age of progress, we would state that after July, 1892, no horse-cars will be permitted to run in the streets of Washington, D. C. It will not be many years before a street-car drawn by horses in any large city of the United States will be a curiosity.

ELECTRICAL PROGRESS.—There is no branch of science where the changes are so sudden and the progress so rapid as in that of electricity. It is only by a constant perusal of papers discussing that branch of science that a person can keep abreast of it. Books are quite too slow.

AN ELECTRIC ROAD FOR WHATCOM.—The Dooley Walty Electric Street Car Company of Whatcom, Washington, has been awarded a

contract for the construction of four miles of track from that town to Whatcom lake—the work to be completed by January 1, 1892.

USEFUL INFORMATION.

The Banana a Developed Lily.

Goldthwait's Geographical Magazine says the banana belongs to the lily family, and is a developed tropical lily, from which, by ages of cultivation, the seeds have been eliminated and the fruit, for which it was cultivated, greatly expanded. In relation to the bearing qualities of this fruit, Humboldt, who early saw the wonders of the plant, said that the ground that would grow 90 pounds of potatoes would also grow 33 pounds of wheat, but that the same ground would grow 4000 pounds of bananas, the proportion thus being, to wheat 133 to 1, and to potatoes 44 to 1. The banana possesses all of the essentials to the sustenance of life. The savage of the sea Isles and the jungle owes what he has of physical strength to this food.

Wheat alone, potatoes alone, will not do this. When taken as a steady diet it is cooked—baked dry in the green state, pulped, and hollid in water as soup, or cut in slices and fried. I do not know whose hearty I admire the most—the majestic cocoa palm, with its heavy crown of great fringed leaves, or the graceful banana, with its great leaves, which are six feet long and two feet wide.

The leaves of the banana are tender, and the strong winds of the tropics—the hurricanes—soon tear the leaves in strips, thereby adding to their grace and beauty. The banana is a fruit that heats and blurs, as well as men, are fond of, and the owner, when he lives in a sparsely settled country, must needs protect his plantation by a fence of some thorn plant.

A CURIOUS QUALITY OF COTTON SEED OIL.—We have already adverted to the curious quality which cotton-seed oil possesses of taking up lead under certain conditions. That quality is now being utilized and adds one more to the numerous uses to which this remarkable product can be applied. The peculiarity referred to is shown as follows: One gallon of pure cotton-seed oil is placed in a suitable iron vessel into which 20 pounds of molten lead are poured. After a thorough stirring the lead separates into globules, and when the oil has been poured off, after cooling, there is found to be about 17 pounds of the lead, the remainder having been absorbed by the oil. On the lead being again melted, and the operation repeated to the fifth pouring—the amount of lead being less at each succeeding pouring—the total amount of lead absorbed is about 10 pounds. The oil thus charged with the lead is then used as a paint, being applied in the ordinary way to metallic surfaces. It is claimed that this liquid, which adheres closely and becomes very hard, is especially useful in protecting metals from oxidation or corrosion.

NATURAL GLASS.—A mineral discovery of unusual value is reported from Kamooraska, in Lower Canada. It is stated that an entire mountain, composed of silicates, otherwise known as vitrifiable stone, of a purity certified by the provincial engineer to average 98 per cent, has been found. This material is used for the manufacture of the finest glass, and it is believed to exist nowhere else on the American continent in such purity. The provincial government has been asked by a deputation to guarantee four per cent interest for ten years on £20,000, if a local company subscribe that amount, to develop the new industry, and has promised to consider the request if the principal municipality concerned is prepared to take a fair share of the risk.—*London Iron.*

THE HORSE AND THE VELOCIPEDE.—It is noticeable that, while the speed of various machines or instruments for accomplishing various desirable things is being continually increased, that of horses has remained at a standstill for some years past, and it is believed by some competent men has about reached its highest development. The speed of bicycles has now almost reached that of the trotting record, and is being continually increased, so that it bids fair to surpass the horse. Locomotives make faster time continually, and do it with heavier trains while on the water the transatlantic record is being constantly improved, with promise of still further improvement.

THE HEAVIEST MODERN ORDNANCE is the English 110-ton gun. Its charge is 960 pounds of the best prismatic gun-powder, and the cylindrical steel shot weighs 1800 pounds. At the last test this enormous shot penetrated entirely through compressed armor (steel-faced iron) 20 inches thick; then through an iron backing five inches thick; then it pierced wholly through 20 feet of oak, five feet of granite and 11 feet of hard concrete and three feet into a brick wall. No existing fortresses, much less armored vessels, could withstand such a shot.

PATENTS.—The average number of American patents issued yearly is about 20,000. England, which comes nearest to us, issues only about 4000 to 5000 a year, and its system is very much more lax than ours. Patents are issued without any conditions as to novelty or merit; and not two applications in 100 are rejected. In Prussia the number granted annually is less than 100; in Belgium, 1500 to 2000.

GOOD HEALTH.

The San Francisco Cancer Cure.

We are constantly receiving letters from various parts of the State, and from the Eastern States as well, asking if we have personal knowledge in regard to the truthfulness of the reported cases of cancer cures in this city, to all of which we send favorable answers. The writer, the senior editor of this paper, has made this matter a most careful study for some five years, and we are constantly more and more confirmed in the correctness of our convictions, notwithstanding the persistent denial of many physicians of this city that no such cures are being effected.

Such denial are made without personal investigation and nothing more heartless or more devoid of truth ever dropped from lips or pen. We now reiterate and declare, without qualification or fear of successful contradiction, that all that we have heretofore said in regard to this matter is correct in every particular.

If we do not state the truth, a successful disproof can easily be made and the writer he put to open shame as a falsifier.

What we have said and still affirm is that patients are constantly being cured of a malady that the best and leading physicians of this city, practitioners of undoubted skill in their profession, have pronounced malignant cancer, in such advanced states that no mistake can be made in the diagnosis. Many of these patients have been operated on and the cancer removed by regular surgeons before treatment by Dr. Cook, and the malady came again, and further operations recommended by those very physicians as absolutely necessary. We have repeatedly given the names and addresses of the patients and the physicians to whose treatment they had previously submitted. If we have made misstatements in these cases, proof of the same might be readily obtained, but none has been adduced.

We would furthermore say that the statements made to numerous patients that caustics and mineral poisons are used by this successful practitioner are utterly false and without a shadow of truth. The most malignant cases of scirrhus, both on the surface and internally, are cured by purely constitutional treatment, without so much as reddening the skin or producing the slightest internal irritation.

We hold that it is a sin and a shame that our physicians in this city, with a few honorable exceptions, persist in their personal denial of these facts, of which they know nothing from their own observation, and still refuse to investigate whether these things are so or not. Their recalcitration in the matter is leading scores to the grave in this State every month, while a little investigation would open the way to one of the greatest boons to suffering humanity which ever blessed the world in which we live.

Discharged Cured.

In proof of the above, we append the names of several patients who were discharged as cured during the week ending August 29th last:

Miss Jansen, a young Swedish girl; cancer in her mouth. Lived in the city, but has gone to a place in the country.

Miss Rose Ward of Vacaville; cancer in both breasts.

Mrs. Wyman, of Los Olivos, Santa Barbara county; internal cancer.

In each of the above cases the disease had been pronounced cancer by leading surgeons, and the knife recommended as the only remedy.

A DANGEROUS PRACTICE.—"In the course of my practice," said a prominent physician to a *Call* representative recently, "I have had a great many cases of 'white swelling' and injuries to the knee-pan among women. Usually the patient is unable to make any explanation as to how the injury was received. Some will attribute it to a strain in going downstairs, or from walking too far, or similar causes. A careful investigation of the matter, however, has shown me conclusively that these knee injuries result almost entirely from the habit, very general among women, of closing a bureau drawer by a push of the knee. This very common and mischievous practice bruises the knee, causes changes in the synovial fluid that lubricates the joint, and has even, in some cases, produced fracture of the knee-pan."

EXPLOSIVE MEDICINE.—In the June number of the *Therapeutic Gazette*, reference is made to an article which appeared in *La Pratique Medicale* for May 5th, calling attention to an accident that had happened from carrying chlorate of potassium tablets in the pocket. The tablets had been prescribed for a patient who was suffering from ulcerative stomatitis, and he was in the habit of carrying the medicine about with him. One day, as he sat down, a detonation was heard, and before he could remove his clothes, he was seriously burned. The tablets, wrapped in a piece of paper, were carried in his pocket together with a penknife, and it is supposed they detonated under the influence of concussion and set fire to his garments.

AN AUTOMATIC LIFE SAVING BELT has been tried in the Thames. It can be crowded up like a ball and fired from a cannon or thrown by hand, the belt righting itself by contact with the water.

Passing Events.

The manufacturers and employers of this city having organized and attained strength sufficient to insure success, now ask all engaged in manufacturing or employing labor, to join their ranks so that concert of action may be possible when found necessary.

The Folsom Water Power Co., whose plant is described in this week's PRESS, intend furnishing electricity for power to the city of Sacramento, conveying it from Folsom. This is a very important move indeed. It is not beyond the possibilities, within a very few years, to see electricity conveyed to the cities in San Francisco bay, from sources of water-power in the distant mountain streams. At Frankfurt in Germany, they are transmitting a power current 110 miles.

The streams are now low in the mountains,

and in many places the river-bed miners are reaping their harvest. But low water is not so good for the quartz miners, as some stamps have to be hung up.

There is nothing much new to report of the two new mining camps in Nevada and Utah. The prospectors are at work there and will very shortly determine the merits of the respective camps.

Who Would Be the Most Benefited by Bimetallism.

Last week Senator Stewart of Nevada made a public speech in this city advocating bimetallism. The arguments presented, backed as they were by a formidable array of statistics, brought the gold-bug organs to the front, and in their desperate efforts to undermine the splendid effort of the able senator, make assertions far from the truth. In their wild endeavors they either directly or indirectly claim that by remonetizing silver only mine-owners will be largely benefited. While there is no denying that the mining industry will be largely advanced by bimetallism, yet these organs appear to think that their readers are devoid of reasoning faculties, and that in being so they will accept as a fact, as the *Call* of Sept. 13 puts it, that "Mr. Stewart thinks meanly of the intelligence of the farmers when he says that they 'must have free coinage in order to get more money and better prices for their exports.' It is a very long time since any class of persons in the United States entertained the delusion that prices were governed by coinage—unless the coinage were depreciated."

The Senator's position is eminently correct. Taking the silver product of the United States and mine-owners' increased income to be derived through the remonetizing of silver would not be much, if any, over \$16,000,000, while farmers would be benefited several hundred million dollars. In confirmation of this, we will briefly state that from 1868 to 1878 the price of wheat averaged at the port of New York \$1.32½ a bushel, while from 1885 to 1888 the average was \$7 9-10 cents per bushel. To illustrate still further, the following table is given of the average prices at the port of New York:

	1868 to 1876.	1885 to 1888.
Corn, bushels.....	\$.77½	\$.60 3-5
Wheat, bushels.....	1 32½	\$ 7 9-10
Cotton, lb.....	18½	10
Butter, lb.....	26	16
Cheese, lb.....	13½	9

The price of silver from 1868 to 1875 continued at par \$1.29½ per ounce, but from 1885 to 1888, the average price went below 97 cents an ounce. Taking our large crops in the above products of the farm, and any school boy can readily figure out the loss to farmers through the depreciation in the market value of silver by its being demonetized. To illustrate the loss incurred by farmers, we give the following from a letter written in September, 1890, by a London firm that has large dealings with English farmers: "The exchange value of the ruble (silver coin of 75 cents value) to-day is quoted at over 30d, against only 25½d at the beginning of April, and 24½d a year ago. This depreciation of the ruble in Russia quite prevents Russian shippers from fulfilling their engagements, no less than 4s per quarter (eight bushels) having by this means been added to the cost price of wheat since April, while compared with last year, there is a difference of 5s per quarter against the shipper. In other words, at the present rate of exchange, 30s per quarter paid by English buyers represents in the Russian price and measure only about 80 copecks (a copeck is ¼ cts.) per pood (a pood is 36 lbs.), while last year the same price was equal to 100 copecks or one ruble. Thus the Russian producer loses 20 per cent. Two to three years ago, however, the ruble exchange on London was as low as 19d, so that at that time, if 30s per quarter in English money was obtained, it represented 125 copecks per pood. This state of things can not fail to have an effect upon prices, for we cannot have both Russia and the Atlantic ports holding back their wheat for any time without sending up values." If the United States had free coinage for silver, then the Russian ruble would be still higher, as would Indian rupees, a silver coin of about 50 cents legal tender value. In paying for Indian wheat, etc., English buyers either do so in Indian council bills or in rupees, which they buy in gold on the basis of the market value of silver.

Manufacturers and Employers.

An organization of the Manufacturers and Employers of California was perfected last month, as was stated in the PRESS at the time, and the secretary of the board now announces that the membership is sufficient to insure the success of the association. It is the intention to invite every employer of labor to join before October 1st, but after that time 60 day's notice will be required.

In a circular issued on the 10th inst., it is announced that the association has been recently formed for the purpose of promoting the business industries of the Pacific coast, and with the belief that by unity of action and purpose employers can the better withstand the tendency of "trade unions to impose unjust and ruinous exactions."

The declaration of principles of the association is as follows:

"This association is formed to promote the manufacturing interests of the Pacific coast. Its policy is not dictated by a spirit of aggression, but it shall be the earnest endeavor of its members to prevent friction, and to peacefully settle all disputes that may arise between employer and employee."

"We, the members of this association, have no wish to interfere with the indisputable right of labor to organize, but believe that the organization and the federation of labor compel the organization and federation of employers of labor, to the end that neither party shall tempt the other to overstep the bounds of right, reason and justice."

"We believe that the arbitrary spirit shown by the unions in the absence of any effective restraining power, and the frequent strikes and boycotts which have, in consequence, prevailed in this community, are dangerous to its industries, and this association of employers is formed to check these growing evils."

"We recognize the right of labor to organize in its own defense or to ameliorate its condition, and we, as employers, will not trespass on that right by refusing employment to any one because belonging to such labor organization; but we reserve to ourselves the right to decide as to whom we shall or whom we shall not employ."

Coast Coal.

The opening up at Carmelo Bay, Monterey county, of a bituminous coal mine, is causing renewed attention to the coal fields in this State. This bed gives promise of a large supply of steam coal. Something over 200 tons of the coal sent to this city and tested for steam purposes gave much satisfaction, and under the favorable results obtained more energetic measures will be taken not only to thoroughly develop the mine from which the shipments came, but open up other mines in the vicinity.

Although California is the pioneer coal producer on this coast, yet the coal mined has never stood high, owing to its being mainly lignite and of a poor quality at that. The first coal mined in this State was at Mt. Diablo, Contra Costa Co., in 1852, but it was eight years thereafter, or in 1860, before the mines there were opened out so as to be large producers. Several other districts have been since more or less developed, bringing the total product of the State to about 125,000 tons in 1890.

Owing to our large dependence on foreign and up coast coals, more interest is being manifested in the subject of an adequate fuel supply for the increasing demands of the State, which has resulted in more determined and well-directed research. This research has been largely stimulated by constantly improving inland transportation facilities, and also steadily growing local fuel requirements in many parts of the State. There are many persons who keep well informed on coal mining in this State, who are free in expressing their belief that judging from recent discoveries of coal beds in various sections of the State, the time is not far distant when California will cease to be so largely dependent upon foreign coals for its requirements.

NEW OREGON CAMP.—Geo. A. Dysou, postmaster at Brownsville, Oregon, writes us as follows: We have a new camp on the head of this creek here, or, at least 40 miles from here, known as the Calepovia and Bine River District. The Poorman Co., have a tunnel on about 240 feet, and have just erected a small prospecting mill, but as yet, have failed to make it pay, owing to the plates being poor and the screens too coarse, so gold can be panned out of the tailings. There is no road yet, and everything has to be packed in on horses, some seven or eight miles. The ledge is a large

one being 20 to 25 feet wide and the drift is now on black decomposed quartz showing free gold, but very fine. I have been on this coast some 30 years on various camps in California, Nevada and Idaho, including eight years on the Comstock, and consider this new camp very promising, as there are lots of leads and a great supply of wood and water. The only drawback is that there are no roads, and capital has not yet come to the assistance of the miners.

Returned as Agricultural Land.

We recently stated in the PRESS that Acting Secretary Chandler, of the Department of the Interior, had made a new ruling in which he holds that in order to defeat agricultural entry on the ground of mineral character of land, it must be shown that the mineral was known to exist at the time of entry. Heretofore the practice has been to cancel agricultural entries where mineral was discovered at any time prior to issuance of patent. The ruling is a very bad one for the mining interests. Half the time people do not take the trouble to inquire as to the mineral, or prove its presence, unless some one tries to "gobble" the land as agricultural by making entry of it. Under this ruling it is useless to protest. This is "Department law," not "Congressional law," and the miners' rights are disturbed by some ephemeral official.

A self-explanatory comment on this "agricultural and mineral land question" is given in the annexed paragraph from the Yreka (Siskiyou Co.) *Journal*: "Several men and boys are usually engaged in working the bed of Cottonwood creek, at the Old Dave Horn ranch, Hornbrook, sold some years ago to the railroad company, and make from \$2 to \$5 and \$6 a day with rookers. The workers sort out around like a crowd working in the ruins of a fire, without taking up claims, from the fact that no claims would be recognized, the land having been returned as agricultural land many years ago, and so recognized at the Land Office. As long as the miners work harmoniously, there will probably be no trouble; but if they quarrel, all will be fired out in short order. This crowd will probably take out between five and ten thousand dollars before the winter rains stop working in the creek bed, which has to be dug up as deep as 15 feet in some places to reach bedrock."

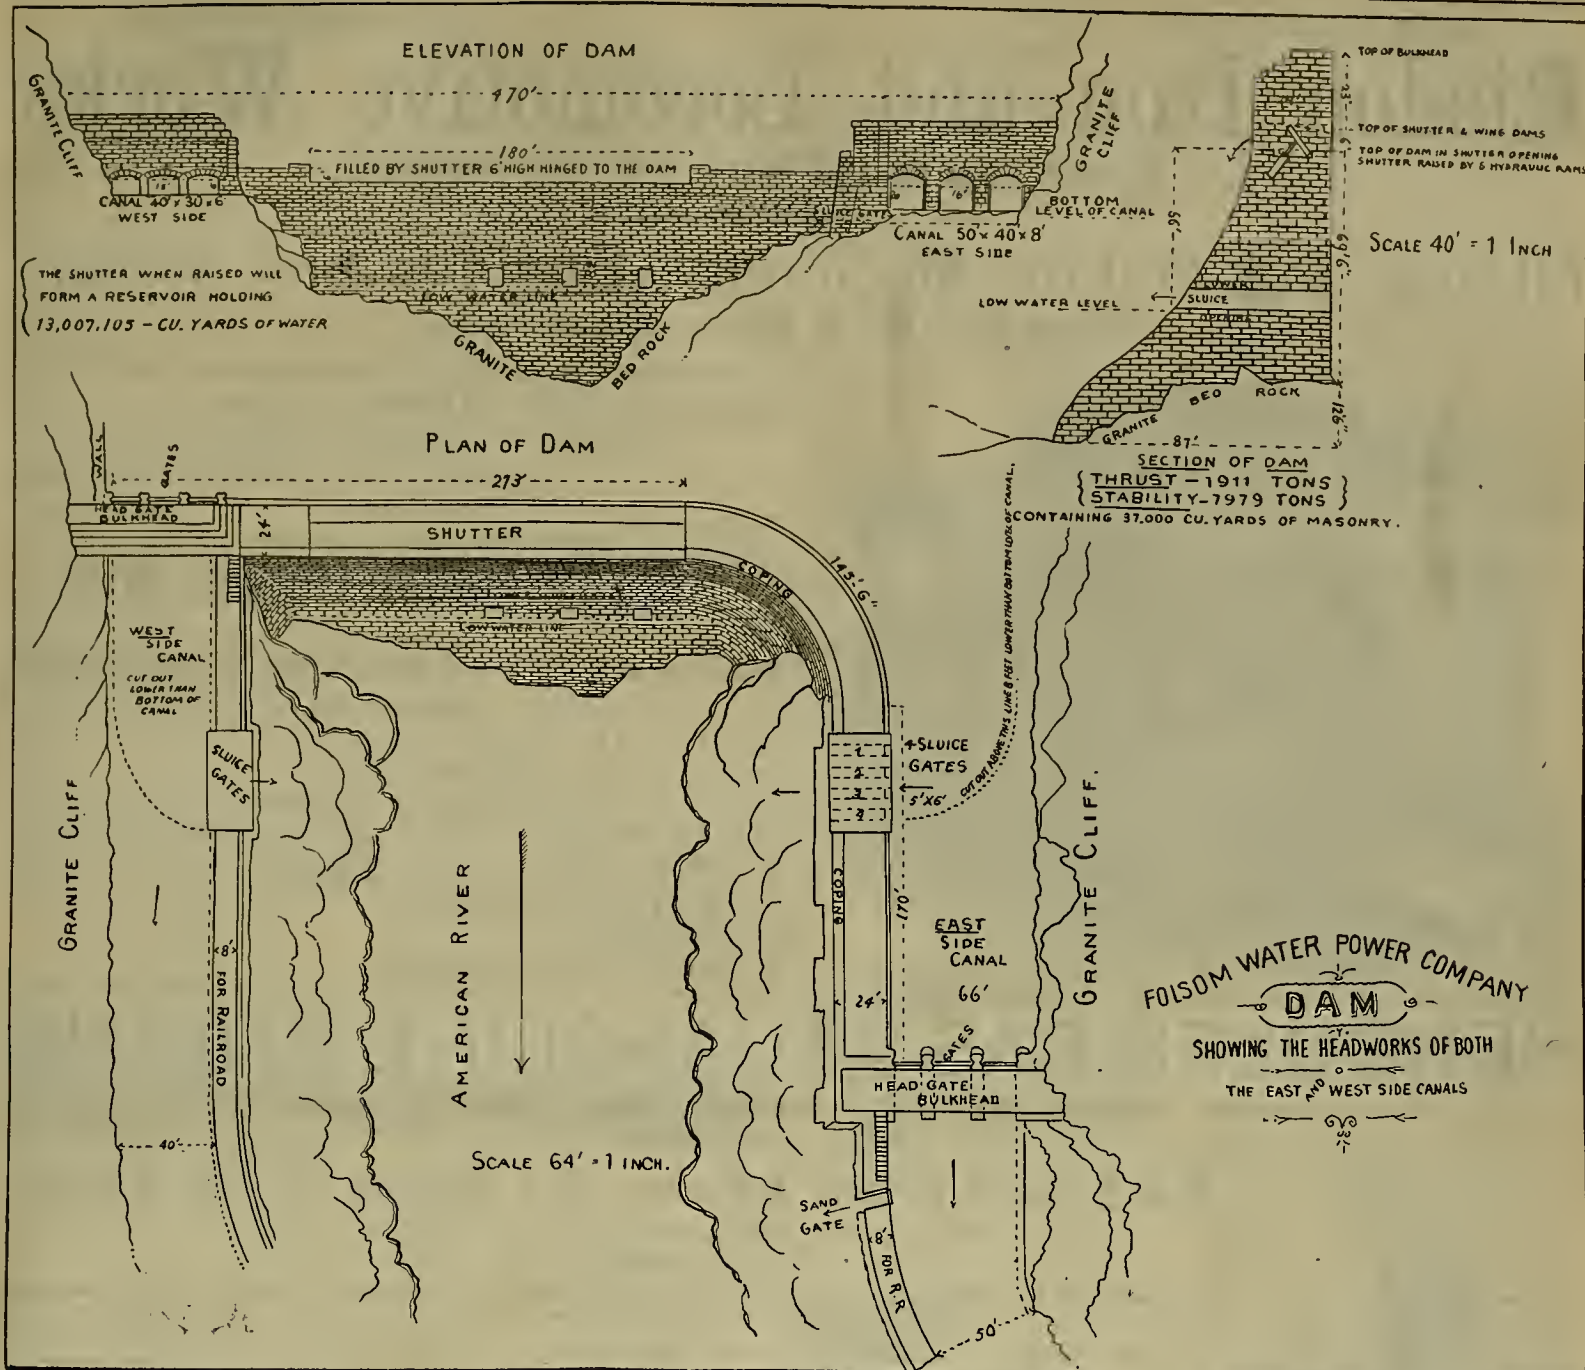

MINING SUIT.—M. W. Fox has filed another suit against the Directors of the Savage mine, and, as in a previous suit, Fox charges that the defendants have entered into a conspiracy with certain milling companies in Nevada whereby the ores taken from the mine are reduced so as to leave about 50 per cent of gold or silver in the waste tailings. These tailings, it is asserted, the defendants caused to be worked over to their own advantage, thus entailing a fraud upon the plaintiff and other stockholders. The prayer of the complainant is for a permanent restraining order and for \$500,000 damages.

MEXICAN TARIFF.—Under the new Mexican tariff, machinery for industrial use, agricultural, mines and cars, is to be free of duty when it is not arranged to be moved by crank or pedal; if so arranged, it is to pay five cents. Tools are reduced from 10 cents to 5 cents; steel ingots reduced from 5 cents to 3 cents; pig iron reduced 1 to 3 cents, and bar iron 5 to 10 cents, according to quality; angle iron will be 3 cents, sheet iron and corrugated iron, galvanized or not, 4 cents; iron beams will remain at 1 cent; manufactures of iron, not otherwise specified, will be increased from 20 to 25 cents.

PINE NUT.—Reports from Pine Nut are to the effect that Zirn has struck a silver vein four miles from his other claim, the Bank of California. Numbers of men are still going from Carson to the Pine Nut mines. The Pine Nut and the Monarch Cons. claims, both, have men at work.

INDISPENSABLE.—The Coronado Foundry and Machine Co., Coronado, San Diego Co., in renewing their subscription, write us as follows: "We find the MINING AND SCIENTIFIC PRESS becoming indispensable and get a great deal of information from it."

ALUMINUM BEARING CLAY is reported as having been discovered by Capt. George Alsworth at Redondo Beach, Los Angeles Co.

The Folsom Dam.

(Continued from page 177.)

for the convict labor, a water power to be developed in the Prison-yard, where the State is now huddling a power house to utilize this power. Six powerful water-wheels, and other machinery has all been provided, and is on the ground. The wheels are 87-inch Lefel turbines, No. 2 "Special."

The work below the prison is simply excavation, considerable of which work has already been done. A broad-gauge railroad, belonging to the Folsom Water Power Co. extends along the outer bank of the canal from the dam to the town of Folsom, where it is connected with the general railroad system of the State.

There has been expended on the work by the Folsom Water Power Co. and by the State of California, more than half a million of dollars. The benefits to spring from its completion are both of a public and private nature.

The erection of this dam has formed a "still-water basin" about three miles long in this section of the river above the dam. Under franchises from Sacramento and Placer county the American River Land and Water Co. has built across the river a heavy timber boom, supported by three massive granite masonry piers, each upward of 50 feet high and 50 feet wide on the base. They have erected a saw-mill at the boom, and float down the river to the mill large quantities of logs from their forest properties on lands on the upper branches of the river. Careful and complete estimates show that on these lands there is now standing upward of 360,000,000 feet of pine lumber, which, by the river and the boom, can be brought at great profit to market. This is but

a portion of the timber land so located tributary to the boom.

The Folsom Water Power Co., foreseeing that, upon the completion of their canal, during a portion of the year all the water of the river could be diverted from the river bed, obtained more than 20 years ago the right to mine the river bed, and said right is protected by U. S. patent. This right they have protected jealously, and so soon as the first section of the canal is finished they will be able to commence such mining.

One of the engravings shows an elevation of the east side bulkhead while being constructed, by which the massiveness of the structure can be understood. It is now 18 feet higher than the cut shows it. The water is drawn from this to the power house, and drops 7.33 feet, where it is utilized on the Lefel turbine wheels for power at the prison. After leaving the wheels, it passes into the canal and flows on to Folsom. The contract with the company is that the State furnishes all the labor required to complete the work down virtually to Folsom, and this is given in payment for the land on which the prison is built and the perpetual use of the power, with certain other privileges. The power will be used at the prison for pumping, lighting and the jute-mill.

The power-house in which the wheels are to work is built of stone, and the walls are now up. The wheels are in place in their concrete arches ready for the water. These wheels are very large, and it took three flat-cars to bring the six wheels from the East.

The irrigation feature is an important one in this plan, as may be imagined when it is stated that water can be delivered to between 400,000 and 500,000 acres of land. It was at first

thought possible to supply water to some 200,000 acres, but special surveys have been made, extending over many months, and it has been ascertained that the canals extending from this dam will deliver water to a much larger area than was originally apposed. The area will include all that region between the Cosumnes and American rivers on the north, and the American and Bear rivers on the south, extending in fact, to within two miles of Wheatland in Sutter county.

It is the intention to utilize the waters of the American river by storing them in immense reservoirs during the months of most copious flows, and distributing them when needed. All of this water has been going to waste. The ordinary common barley and wheat producing land can then be made to yield fruits, etc. All the land will naturally be greatly enhanced in value by being available for irrigation. Other companies will attend to the distribution of this water on the lands. There is plenty of water; it only needs to be conserved and distributed.

The development of the timber and inner interests of the immense timber regions of the upper waters of the American river will give an excellent source of income to the company. Saw-mills, sash, door and blind factories, will be built at the dam and on the railroad. The river mining plan contemplates work in a mile and a half of the bed of the American river, which will be laid bare. There will be plenty of water power for heavy hoisting, as necessary in river mining.

The Folsom Water Power Co. (the offices of which are in this city) will carry the water to Folsom, where the principal power will be developed. A cable will be extended from this

point to Sacramento, 18 miles, and electric power furnished in quantity to that city for light and power. The capital city will be enabled to have all the electric power it needs when the plans of this company now being perfected are carried out.

The granite for building this dam is taken from the banks of the river on the spot. It is first-class material in every respect. It is used not only in the dam, but in the bulkheads, houses, etc.

The original foundation of this dam was laid as far back as 1866. In 1886 the new foundation of the present structure was laid on the old foundation, and the dam was finished in 1891. The entire works can now be completed so as to make a large portion, if not all, of its power available early next year. The dam is a splendid one, but had to be made very strong. The river is one that sometimes rises as much as 60 feet in a few hours, and in flood times is a torrent of magnitude. From the crest of the dam to the level of the water below (as shown in the engraving on the first page), the water falls about 57 feet. The engravings show the headworks of both the east and west side canals, plan and elevation of the dam, with section, etc. This is the most important water-power plant in the State or on this Coast. The fact that electricity will also be generated on a large scale, and distributed for power to the Capital city of California, gives an added interest at this time, when the transmission of power by electricity is attracting so much attention.

The Fresno Edison Electric Light and Power Company has ordered a 200-horse power holler and a compound cut-off engine for the new plant, which will be in operation in October.

We have on hand and for Sale Cheap, A 50-H. P. PUMPING PLANT

— CONSISTING OF —

- One (1) 6" x 6" Plunger Pump.
- One (1) 4" x 6" Jack Head Pump.
- One (1) 10" x 36" Retort and Furnace.
- One (1) Complete Outfit for a 2½-ton capacity chlorination Works.
- Two (2) 6000-gallon Circular Tanks.
- One (1) Amalgam Barrel.
- One (1) Batea.
- Three (3) Frue Concentrators.

HERCULES GAS OR GASOLINE ENGINE

FOR POWER OR PUMPING PURPOSES.

The Lowest Priced Reliable Gas Engine on the Market.

SEND FOR ILLUSTRATED CATALOGUE AND PRICE LIST.

For Simplicity It Beats the World. It has Fewer Parts, and is therefore Less Likely to get Out of Order than any other Gas Engine now built.

IT OILS ITSELF FROM A RESERVOIR. JUST LIGHT THE BURNER, TURN THE WHEEL, AND IT RUNS ALL DAY.

No Carburetor to get out of order. No Batteries or Electric Spark to care for. Always Ready, and a Boy can start it at once. No Double or False Explosions, which are frequent with the Unreliable Spark.

IT RUNS WITH A CHEAPER GRADE OF GASOLINE THAN ANY OTHER ENGINE, AND CONSEQUENTLY IT COSTS LESS TO RUN IT.

- California.—William Cameron, Millipitas, Impalement trap; Alexander N. Chalmers and J. R. Wallace, S. F., pump for planers or other machines; Andrew Fraser, assignor to Kieckhefer Iron Works, S. F., ore concentrator; Joseph Herring, Pomona, fruit-gatherer; Theron H. Lark, St. Helena, assignor of one half to W. A. McKenzie, Napa County, wagon-tongue support; Mark P. Madden, Coronado Beach, device for tapping mains; Francis M. Mecum, Chico, gang plow; James C. Nicholson, S. F., reversing valve gear for engines; Edwin M. Reese, Santa Paula, ditching machine; Henry Richmond, Santa Cruz, rotary air compressor and pump; August H. Scholz, Holz, assignor to the Kieckhefer Iron Works, S. F., ore crusher; John T. Smith, S. F., oiler; Archibald W. White, San Jose, pump; Oregon Robert Bruce, Penitentiary, halter; Jonas D. Henry and W. E. Wood, Portland, feed-mill; Washington—Joseph Lanauer, Spokane Falls, mail-bag; John Sampson, Walsburg, chum.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and For-

out of place or shape when the tender is pressed forcibly against any wall or substance.

SELF-HOISTING MECHANISM.—George Biddall, Woodland, Yolo Co. No. 450,247. Dated Sept. 8, 1891. This invention relates to that class of lifting mechanisms in which the operator, by means of a suitably arranged tackle, raises himself to various heights to perform any work desired. The object is to provide a device adapted in the use of picking fruit and pruning trees. A standard or post is supported on a base-frame, and on this is a sliding seat. The operator takes his place upon the seat, and pulling on the hoisting rope, raises the entire seat-frame and himself. In this upward movement, a pawl or dog slips freely by the teeth of a rack so that he has not to attend to this pawl or dog, but simply to the exertion of his power, resulting in lifting himself to the point desired. When he has reached this point, he has only to relieve the rope, when the pawl will engage the rack. In coming down, he beats the pawl out and slacks on the rope. This device can be readily transported from tree to tree in an orchard, is very stable and not liable to rock or get out of order. A fruit-basket or bucket may be attached to the seat to hold the fruit that is picked.

ANT-EXTERMINATOR.—Michael Barthel, San Jose. No. 450,246. Dated Sept. 8, 1891. In a former patent issued to the same inventor a box was shown having holes upon the opposite sides, a poisonous compound placed within the box and an absorbent material arranged in contact with the compound for the purpose of keeping it in a moist condition. In the present invention, the box is so constructed that the inventor is enabled to dispense with the moistened absorbent material and to retain the compound in its properly moist condition for use without the use of the absorbent material. A compound attractive and fatal to the ants is placed in the box, and it is carried away and stored in their nests to be eaten and fed to the young, the tribe being thus destroyed without getting into food and other articles.

Fulda's Band and Hoop Coupling.

A very simple and effective band and hoop coupling for large tanks is that shown in the engraving, and patented and manufactured by Fulda Bros., 30 to 40 Spear St., this city. The ease to which it may be applied to any hoop places it ahead of many more elaborate and expensive contrivances for the same purpose. It consists simply of two eye bolts, each bent at right angles, and engaging into each other. If desired, a sufficient lap of hoop renders it un-

necessary to rivet it to the hoop. It will fit the circle of any tank regardless of size, and is particularly adapted to large mining, water or wine tanks. The engraving shows what a very simple device this coupling is.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions to our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Citations free.

Two New Books on Steam Engineering.
By Emory Edwards.
JUST READY.

The American Marine Engineer.

Theoretical and Practical, with Examples of the Latest and Most Approved Marine Practice. For the Use of Marine Engineers and Students. By EMORY EDWARDS, Marine Engineer. Illustrated by 85 engravings. 12mo. 435 pages. Price.....\$9.50
By mail free of postage to any address in the world.

CONTENTS.

Introduction. Chapter I. The Theory of the Steam Engine. II. Expansion of Steam. III. The Efficiency of Steam Engines. IV. Triple Expansion Marine Engines. V. Cylinder Ratios of Triple Expansion Engines. VI. Calculation of Work Done in a Compound Engine. VII. To find the Horse Power of Simple, Compound and Triple Expansion Engines. VIII. To find the Mean Pressure. IX. Slide Valves. X. Proportioning Ports and Slide Valves. XI. Link Motion Valve Gear. XII. Valve Motion Diagram. XIII. How to Set a Slide Valve. XIV. Engine Construction Details. XV. United States Government, General Rules and Regulations for Steam (Marine) Boilers. XVI. Burning of Fuel. XVII. Forms of Steam Boilers. XVIII. Modern Marine Boilers. XIX. Riveted Seams. XX. Forced Draft. XXI. Water Tube Marine Boilers. XXII. Repairs at Sea, and How to Make Them. XXIII. Taking Care of an Engine. XXIV. Valuable Information. XXV. Steam Yachts and Launches. XXVI. Modern American Marine Engines and Boilers. XXVII. Steam Engineering. U. S. Navy. XXVIII. Triple Expansion Screw Engines and Boilers of the U. S. S. Philadelphia. XXIX. Examples of Recent Engines. XXX. Triple Expansion Engines. S. S. Columbia. XXXI. Compound Marine Engines. Appendix. Index.

An illustrated circular of 6 pages, quarto, giving the full table of contents, with specimens of the engravings of this valuable book, will be sent free of postage to any one in any part of the world who will send us his address.

ALSO,

EDWARDS'

600 EXAMINATION QUESTIONS AND ANSWERS.

FOR ENGINEERS AND FIREMEN

HENRY CAREY BAIRD & CO.,
INDUSTRIAL PUBLISHERS, BOOKSELLERS & IMPORTERS,
810 Walnut St., Philadelphia, Pa., U. S. A.

Blinn's Tin, Sheet-Iron and Copper-Plate Worker.

A New, Revised and Enlarged Edition, from New Type, with New Engravings.
One of the Most Popular Technical Books ever published in the United States.

JUST READY.

A PRACTICAL WORKSHOP COMPANION

FOR

TIN, SHEET-IRON

AND

COPPER-PLATE WORKERS.

Containing rules for describing various kinds of Patterns used by Tin, Sheet-Iron and Copper-Plate Workers. Practical Geometry. Mensuration of Surfaces and Solids; Tables of the Weights and Strengths of Metals and other Materials; Tables of Areas and Circumferences of Circles; Composition of Metallic Alloys and Solders, with numerous valuable Receipts and Manipulations for every-day use in the workshop. By Leroy J. Blinn, Master Mechanic. A new, revised, and enlarged edition, printed from new type, and with 170 newly engraved illustrations. In one volume, 12mo, 200 pages, price \$2.50, free of postage to any address in the world.

It having been found necessary to make a new set of electrotype plates and new engravings of this most popular book—the old ones having been worn out by actual use—it was determined to have the book re-edited and to add to it, in the different departments, new, recent and necessary matter. All of the old illustrations of patterns have been retained, and new ones have been added. The portion treating of metallic alloys and solders has been entirely rewritten, so as to have a more systematic arrangement, and to bring it abreast with the best modern practice in this interesting and important field. In all the other departments new matter has been added, every effort having been made to render the entire work, in the future, if possible, even more useful to the tin, sheet-iron and copper-plate worker than in the past.

ABSTRACT OF CONTENTS.

Rules for Describing Patterns; Practical Geometry; Mensuration of Surfaces; Mensuration of Solids, and Capacities of Bodies; Tables of Weights, etc.; Tables of the Circumferences of Circles and of the Areas of Circles; Rules for Rendering the Tables Useful; Sizes of Tinware; Capacity of Cylinders, and various other Useful Tables and Information; Practical Receipts, Varnishes, Lacquers, Cements, Metallic Alloys, Miscellaneous Receipts, Strength of Materials, with Tables. Index.

The above or any of our Books sent by mail, free of postage, at the publication prices, to any address in the world.

A circular of 4 pages, quarto, giving the full Table of Contents of this popular book, will be sent free of postage to any one in any part of the world who will furnish his address.

Our New and Enlarged Catalogue of Practical and Scientific Books, 88 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free of postage to any one in any part of the world who will furnish us with his address.

Giant Powder Fuse Cap Fastener.

The instrument represented in the above cut is a new and rapid little invention, being designed to save life and limb, and innumerable lawsuits, by doing away with the dangerous operation of digging out wet and unexploded loads where Giant Powder is used in mining. The little instrument crimps the cap on to the end of the fuse firmly and absolutely water-tight. It is also used for cutting the fuse. They are neatly gotten-up of the finest cast steel, nickel plated. Price, 52 cents, or the entire instrument finished in gold plate, \$5. N. W. MOODY, Fresno, Cal.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Sept. 17, 1891.

The general market does not present any new features deserving particular mention. Iron workers and manufacturers are, as a rule, well provided with orders. The money market continues to show signs of ease under freer remittances from the interior and only a moderate call for funds for speculative purposes. The rapidity with which wheat is being exported gives assurance of more general ease in the money market by the last of the year than for several years. That already exported represents a value to farmers of \$3,000,000, and the ships in port loading wheat will take out fully \$1,500,000 worth (farm value), while there is to arrive under charter for wheat-loading ships that will take out over 425,000 tons of wheat, which at \$30 on the farm will amount to nearly \$13,000,000; and as this grain will be mostly dispatched before January, 1892, it will be available that still larger sums of money will soon be available. It is this general ease in the money market through disbursements to farmers that will undoubtedly give a decided impetus to all kinds of business. As the above only represents disbursements for wheat, when that made on barley, hay, fruits, etc., the total will be about doubled.

QUICKSILVER—Receipts the past week aggregate 237 flasks. There was shipped overland in last month about 30 flasks. The market is strong at full figures in sympathy with a higher market abroad.

MEXICAN DOLLARS—There was exported the past week the following sums: To China, \$25,973 and to Japan \$13,500. The market is fairly steady at about 77 1/4 cts.

SILVER—The market has been slowly falling in London and also in New York. As the Mint has purchased the monthly requirements of 4,500,000 ounces for September, it will not be in the market until Oct. 2d, and in the interim speculators can knock prices to still lower figures. It can no longer be doubted that the silver markets of the world are under a strong moneyed pool, formed for the purpose of speculating in the certificates on the New York market. It looks very much as if the pool had sold large quantities of the certificates at much higher prices, and are now doing all in their power to break the market, so as to get back their sales at lower figures. Silver has become more of a gamble than ever before, and in making it so the market value of many commodities governed by that of silver, is made to fluctuate as the pool desires.

BORAX—The overland shipments in August aggregated 6748 cts. There was exported by sea in last week, 2013 cts to New York. The market appears to have a firmer tone.

LIME—Receipts the past week aggregate 3359 bbls. The market is steady, with, it is said, more being used for fertilizing.

LEAD—The market is fairly strong at full figures.

TIN—In our market there is absolutely nothing to report. The East reports a slack demand. European advices report the market somewhat uncertain, but with the tendency to a return to a normal condition by the turn of the year.

COPPER—The market is gaining slightly in strength, with an advance in quotations received from New York. European advices indicate the market working into better shape for sellers. In their monthly circular, James Lewis & Sons, Liverpool, reports as follows: A material reduction in the consumption of Argenteiferous Copper Matte has been caused by the almost complete cessation of the manufacture of sulphate of copper, pending the absorption of the large stocks resulting from the overproduction of the last and the early part of this year. American consumers have for some time past only supplied their immediate requirements, and consequently hold little, if any stock; it is therefore expected that they will require large quantities during the autumn months, leading to a considerable advance in price, as, owing to the large shipments to Europe, and continued stoppage of the Anaconda mine and works, the available supplies are much reduced.

COKE—Imports the past week aggregate as follows: Cardiff 684 tons, Newcastle, Eng. 1179 tons; total 1863 tons. The market is reported easy.

COAL—Imports the past week aggregate as follows: Kobe 2500 tons, Coos Bay 800, Newcastle, N. S. W. 5596, Carmelo Bay 200, Departure Bay 5180, Cardiff 502, Baltimore 2840, and Seattle 2270; total 20,888 tons. The market is weak for cargoes in all positions. Many large consumers are not disposed to anticipate their wants unless offered concessions. It now looks as if the market will see still lower prices before it advances any on present quotations.

Eastern Metal Markets.

By Telegraph.

New York, September 17.—The following are the closing prices the past week:

	Silver in Silver	London, New York, Copper.	Lead.	Tin.	
Thursday	45-16	95 1/2	12 30	4 47 1/2	20 05
Friday	45-16	95 1/2	12 30	4 47 1/2	20 00
Saturday	45-16	95 1/2	12 30	4 47 1/2	20 00
Sunday	45-16	95 1/2	12 30	4 47 1/2	20 00
Monday	45-16	95 1/2	12 30	4 47 1/2	20 00
Tuesday	45-16	95 1/2	12 30	4 47 1/2	20 00
Wednesday	45-16	95 1/2	12 30	4 47 1/2	20 00

Quicksilver shows no activity at hardening prices. Borax is strong at a slight advance. Copper shows a steady, strong tone. Lead and tin are firm. The demand is only fair.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done to all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their Scientific Patent Agency (B room week to week and year to year.

PLACER AMALGAMATORS

Combined with Steam Shovel or Dredge.

BUCYRUS SYSTEM.

NEW METHOD OF PLACER MINING.

Saves all the Gold. Uses very little Water. Treats large quantities at Low Cost.

— BUILT SOLELY BY THE —

BUCYRUS STEAM SHOVEL AND DREDGE COMPANY,
BUCYRUS, OHIO, U. S. A.

ELECTRICAL ENGINEERING CO.,

— MANUFACTURER OF —

Dynamos and Electric Motors

FOR THE TRANSMISSION AND DISTRIBUTION OF POWER.

Manufacturer of and Contractor for the Installation of all Kinds of

ELECTRIC APPARATUS.

The Dynamos and Motors manufactured by this Company develop the highest mechanical efficiency; they require little or no attention, are almost noiseless, and run with an entire absence of sparks at the brushes, rendering the daily trimming of brushes unnecessary.

Electric Power Apparatus for Quartz Mills, Hoisting, Pumping, Drilling, and all Mining Work, where Long Distance Transmission is desired, a Specialty.

Office and Works, 21 & 23 SPEAR ST., San Francisco, Cal., U. S. A.

ELECTRIC BLASTING

VICTOR ELECTRIC PLATINUM FUSES.
Superior to all others for exploding any make of dynamite or blasting powder. Each fuse folded separately and packed in neat paper boxes of 50 each. All tested and warranted. Single and double strength, with any length of wires.

VICTOR BLASTING MACHINE. Made in two sizes. No. 2 fires 20 to 30 holes. No. 1 fires 5 to 8 holes. Adapted for prospecting, stamp blasting, quarry and general railroad work.

"PULL UP" BLASTING MACHINE. — The strongest and most powerful machine ever made for Electric Blasting. No. 4 size fires 70 holes. No. 3 size fires 40 holes. Are especially adapted for submarine blasting and large mining work.

Standard Electric Fuse and Blast Tester, Wire Reels, new design, Leading and Connecting Wire.

— MANUFACTURED ONLY BY —

JAMES MACBETH & COMPANY,
128 Maiden Lane, New York City.

PARKE & LACY CO., San Francisco, Cal., AGENTS.

HOISTING ENGINES FOR MINES

1, 2, or 4 Drums, with Reversible Link Motion or Pat. Improved Friction.

MADE ONLY BY THE

LIDGERWOOD M'F'G CO.,
1 to 7 N. First St., Portland, Oregon.

98 Liberty St., New York.
34 and 36 West Monroe St., Chicago.
197 to 203 Congress St., Boston.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

Send for Circulars and Price List.

MARSHUTZ & CANTRELL.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

WILLIS G. DODD, Vice-President and Manager.

IRA P. RANKIN, President.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 1300 IN USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

THE PELTON WATER WHEEL CO.

121-123 MAIN STREET, SAN FRANCISCO, CAL., U. S. A.

PELTON WATER MOTORS. Varying from the fraction of 1 up to 15 and 20-horse power, unequalled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. Address as above.

THE GATES ORE AND ROCK BREAKER.

UNLIMITED IN CAPACITY UNEQUALLED IN EFFICIENCY, UPWARD OF 3,000 NOW IN USE. Will do more than twice the work of any other with the same cost in wear. Gives a fineness of product that increases the capacity of any mill from 25 to 40 per cent without any additional expense. THE BEST AND ONLY CRUSHER ADAPTED TO MACADAM ROAD WORK. Send for Circular.

It having come to the notice of the undersigned that their patent rights are being infringed upon, intending purchasers are hereby warned that all such infringements will be duly prosecuted. (Signed) THE PELTON WATER WHEEL CO.

FRUE ORE CONCENTRATOR

OVER 3000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

Manufactured under Patents of April 27, 1880;
September 18, 1883; July 24, 1888;
and March 31, 1891.

Price of Plain Belt Frue Vanner, \$575, f. o. b.

Price of Improved Belt Frue Vanner, \$825, f. o. b.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs," for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - \$650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices.

DAVID McKAY, JR.,
[Signed] Sup't North Star and Original Empire Mining Co.
N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Concentrating Belt manufactured in San Francisco; we can therefore fill all orders on short notice. The length and width of these belts are the same as is used on the Frue or Triumph Concentrating Machines, but can be made of any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen. First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffling surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight rifflings also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

STRONG AND DURABLE.
Price.....\$575 f. o. b.
See for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. This excess in length of material effectively prevents the edges from cracking; plain edge belts have to stretch about one inch to the foot as they pass around the drums. This continuous stretch cracks the edges. The improved belt obviates that difficulty.

The Heine Safety Boiler.

A dispatch from St. Louis, dated Sept. 21st, says: "The Heine Safety Boiler Co. of this city has contracted with the Broadway & 7th Avenue Cable Railway of New York City to supply them with Heine boilers aggregating 4500-horse power, the boilers to be used in operating their new cable system. This is the type of boiler for which the Risdon Iron Works of San Francisco have recently closed contracts with the Palace Hotel and the San Francisco Gaslight Company."

In this connection it may be stated as a fact of interest that the S. F. Gaslight Co. recently tested their Elephant boilers under the most favorable conditions and the result showed an evaporation of seven pounds of water per pound of Sydney coal. Then they made a test of the Heine patent boiler in use at the Risdon Iron Works and got an evaporation of 12½ pounds of water to one pound of coal.

The engraving given herewith shows the Heine boiler. It consists of an upper shell, two water legs and the water tubes. The shell has dished or rounded heads and forms the steam drum. Near each end of the shell, just inside the heads, on the lower side, it is cut away, making an opening about one-quarter of the circumference in length by 13 inches in width.

The tubes are 3½-inch lapwelded tubes, extending from water leg to water leg into the inner sheets of each of which (tube sheets) they are rolled or expanded. Opposite each tube, in the outer sheet (head plate) is placed a hand hole, large enough to insert or withdraw a tube in case of renewals. Each hand hole is closed from the inside with a hand-hole plate which, by an ingenious device for locking, can be removed in a few seconds when necessary to inspect or clean the tube. The hollow stay bolts permit the passage of a 3-inch steam nozzle to blow off any soot accumulating on the outside of the tubes.

A mud drum is suspended in the steam drum (near its rear end) 3½ inches above its lower surface and entirely surrounded by boiling water. The feed water is introduced through the front head of steam drum by the pipe entering the mud drum, thus becoming heated as it flows to the rear of mud drum there depositing its sediment, which is blown off through the blow-off pipe, while the clear water eddies over the sides and head of the mud drum which is cut down about one-quarter of its diameter as shown in section. A supplementary blow-off cock is provided in the base of the rear water leg.

The water column, with gauge glass and cocks, steam gauge, steam valve and safety valve are also attached to the front end of boiler, thus placing all appliances for safety and control at one convenient point.

Light firebrick tiles, resting on the upper and lower rows of tubes (see section) form flues around the tubes which are thus suspended in the heated gases, which sweep along their entire length making three turns to the breeching, which they reach usually with about 400 deg. F. temperature, thus showing the completeness with which the heat is utilized by the boiler. The breeching may be placed at front or rear end of boiler as circumstances may require.

The boiler is inclined 1 ft. in 12 ft. from front to rear and stands with the base of the front water leg resting upon a cast iron fire front while the rear water leg, which is sup-

ELECTRIC GENERATOR FOR USE IN MINING OPERATIONS.—See page 201

ported by the roller, is free to expand or contract. The tubes thus rising from the rear to the front end give natural channels for the circulation of the water, which flows from the tubes into the enlarged area of the water leg permitting the ready and free separation of the steam bubbles. Both steam and water rising through the throat at top of front water leg are deflected by the deflection plate, the water flowing to the rear of the steam drum and dropping into the rear water leg to continue its circulation. The steam passing over the deflection plate to the perforated dry pipe or dry pan is dry and free from water spray.

The inclination from front to rear also gives a larger steam space in front and a larger water space in rear of drum (which is about one half full of water at middle gauge) thus giving very large steam liberating surface.

Every portion of the internal heating surface can be inspected from the outside and the tubes can be examined, cleaned and replaced easily. Among other advantages claimed are: No cold air currents; large steam space; ample steam liberating surface; hot furnaces and cold chimneys; no rivet seams in the fire; positive circulation; no cold feed on hot sheets; ample throat areas.

The Capitol Mill Co., of Los Angeles, have one of their boilers of large size under which they are using oil as fuel, and it gives great satisfaction. The fuel is severe on boilers, but in this case, only the tubes need replacing when burned out. The legs nor drums do not burn out, as the oil fuel does not affect them. The tubes are easily cleaned, as may be seen by the construction.

250-HORSE POWER HEINE BOILER READY FOR SHIPMENT.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

Nevada County Mines.

NUMBER II.

North Bloomfield District.

[From Our Traveling Correspondent.]

The Derbec mine is situated on the Derbec or North Bloomfield channel and is operated at a point about one mile north of Bloomfield. The channel is opened by a shaft 466 feet to bedrock. The channel averages 300 feet in width. About ten feet of gravel, next to the bedrock, is extracted, though there is an average thickness of 370 feet of gravel that would pay immensely if the present injunctions on hydraulic mining could be removed. The ten feet worked gives an actual average of \$249 a ton. The channel has been drifted on for a distance of 7800 feet. At this time the superintendent is working back through the mine, removing pillars which will require several years to exhaust. The gravel is very loose and easily washed. The mine cars are hoisted to the surface, run out and dumped into a large dump-hox. Here the gravel is washed by a hydraulic giant which frees the greater part of the gold. The gravel passes down through a sluice-hox 600 feet long, the bottom of which is packed with car-wheels, laid on their sides, for riffles. The waste drops into an old gravel claim, where it is caught and held until the cement is all air-slacked, when the gravel is re-hydraulicized and run down the gulch 4000 feet where it is caught again, and in time hydraulicized and all the gold caught. From this point it flows into the old workings of the North Bloomfield mine, where it is all held. The Derbec is evidently in the North Bloomfield channel, but in a higher channel, which is far richer than the lower. There is a large extent of country adjoining the Derbec, on the same channel, that is idle and unproductive for want of capital to develop and equip. [Since our correspondent wrote the above, Mr. S. Galavotti, the superintendent of the Derbec, was murdered by highwaymen while taking bullion to town. An account of this outrage is published in another column.—Eds. PRESS.]

The North Bloomfield.

The North Bloomfield Co.'s mine is idle, awaiting the action of the Government, the owners firmly believing that once the rights of the hydraulic miners are properly understood and the immense territory and great wealth of the hydraulic mines made known, the Government cannot fail to provide a way by which these hoarded millions can be extracted and added to the world's wealth.

North Columbia.

Here, as at Bloomfield, the hydraulic mines are idle. The only properties in operation are the quartz mines, three miles north.

The Delhi.

The mine, C. H. Mallon, Supt., is on Grizzly ridge, on the west bank of the Middle Yuba and about 3½ miles from North Columbia. The mine is opened by a crescent tunnel, 1700 feet long, with drift run, from the end of the tunnel, 700 feet, on the vein. The end of the drift out the vein 1700 feet deep and shows a four-foot vein of \$4 ore, enclosed in slate walls. Mr. Mallon has recently driven a crescent of 10 feet, 350 feet from the end of the drift, and here struck the Delhi vein proper, which, at this point, is four feet in width, and very rich in free gold and high-grade sulphurets. The mill is of 18 stamps, and with the present high-grade ore must delight the owners with a large output of gold.

The St. Gothard.

Carl Davis is Supt. of this property, which adjoins and is situated immediately above and to the east of the Delhi. The mine is opened by shaft, which is now down 200 feet and will be continued to a depth of 600 feet. A drain tunnel 1000 feet long taps the vein 180 feet deep. In the tunnel the vein shows 2 to 5 feet in width. In the early workings of this mine the ore milled \$60 to the ton. The present owners expect to continue the development of the mine for another year, at least, before erecting a mill. The hoist on the property is calculated to go to 1000 feet. It was built by the Fulton Iron Works. The millwright is Mr. T. W. Jones, formerly with Conner & Grant, the well-known millwrights.

At Cherokee, North San Juan and Camp-tonville the only difference between them and North Bloomfield and North Columbia is in the degree of deadness. A few years ago there was no section of the State more prosperous. Stores, hotels, banks, etc., were all full of business, and no one looked aught of the future. To-day the towns wear a deserted, desolate air. In Cherokee the buildings are almost entirely deserted. The few people remaining are there simply because they cannot get away. While the miners and those engaged in business have been the principal sufferers, the farmers find themselves left without customers.

It does not seem possible that the billions of gold contained in the gravel deposits, that can only be worked by the hydraulic process, shall forever lie buried there, benefiting no one. Once the present work of the U. S. Geological Survey is completed and the extent of territory, value per yard and aggregate wealth is accurately determined and shown, the industry

will receive the recognition at the hands of the Government that this great and but little known wealth of the United States justly deserves.

Washington District.

The mines of this district are situated on the South Yuba river, 25 miles east of Nevada City and four to six miles on an air line due north of Emigrant Gap. The mountains here are almost bare of all kinds of vegetation and loom up grandly with their rugged and almost perpendicular walls—a prospector's paradise. The mineral bearing veins are all in the belt running between the slate and granite formation, which is here about three-quarters of a mile in width. It can hardly be called a contact as there is no direct or positive contact, but a gradual change of slate to granite for a width of three-fourths of a mile. In this belt the vein-walls run from slate to granite, being of a somewhat conglomerate character. Next to the granite is

The Eagle Bird Mine.

H. C. Callahan is superintendent of this mine. The company has recently purchased the stock of O. Newhouse—a one-third interest—and incorporated under the name of the Diamond Creek Con. G. M. Co., Mr. Newhouse, the former superintendent, giving way to Mr. Callahan, who had charge of the property previous to Mr. Newhouse. The mine is on the south bank of the South Yuba river, four miles due north of Emigrant Gap, with an altitude of 3400 feet. The vein runs from 6 to 20 feet in width, with an average value of \$8 a ton in free gold. The vein-matter carries a very small per cent of sulphurets that average \$120 a ton. The property is operated through tunnel and shaft. The surface tunnel is in 600 feet and onto the vein 360 feet deep. The two-compartment shaft is down 600 feet, with levels run 800 feet south and 300 feet north. The mine is equipped with a 30-stamp mill, 20 of the stamps being 850 pounds in weight and 10 an even 1000 pounds each, with six-inch drop. The superintendent prefers the 1000-pound stamps. The crushing capacity of the mill averages two tons to the stamp. The mine has its own water, which drives the mill under a 180-foot pressure and then drops 235 feet to the air compressors. Three Ingersoll drills are run on ore and two on development. At this time the mine has large reserves in sight. In addition to the mill the company owns and operate a sawmill that adjoins, or may be said to be a part of the mill. This, with the company's store, boarding houses, miners' residences and fine home of the superintendent, make the Eagle Bird a complete mining nest of its own, in this its craggy eyrie.

The Yuba Mina.

Geo. Hare is superintendent, and Haggin & Tevis are owners. The Yuba is situated about three-quarters of a mile below the Eagle Bird and on the same side of the river. The mine is developed by tunnel and shaft. The tunnel, which is 1100 feet long, cuts the vein 175 feet deep, while the shaft is down 800 feet, with drifts run 900 feet on the vein. The average width of the vein is five feet, with a milling value of \$6 to \$8 a ton. The mine is equipped with a 25-stamp mill crushing 60 tons a day. The Yuba has been in successful operation for 25 years and ranks among the oldest and most reliable mines of the country.

Champion.

J. S. Cook is superintendent. Campbell and Sanderson are owners of this claim. The Champion is high up on the side of Lindsey Hill, and about opposite to the Yuba. The vein is opened by two tunnels. The lower tunnel is 230 feet in length, and taps the four-foot vein 115 feet deep; the upper tunnel is in 100 feet, and taps the vein the same depth. At this point the vein is two feet in width. The superintendent places the average value of the ore at \$25 a ton. The higher grade ore is valued at \$500 a ton. In addition to the free gold the vein carries 10 per cent of galena sulphurets that assay \$4800 to the ton, as will be seen the ore now shown in the Champion is the richest in the camp. It seems to be Mr. Campbell's luck to "strike rich," as he has lately found it just as rich in his Washington mine in Calaveras county.

Ormonde.

The mining properties at this point, in the Washington district are under the charge of Mr. Alf. Tredidgo, the well-known and popular mining superintendent.

The Washington M. Co.

Property consists of five full locations—the Baroo, Becker, Don, Dee, and Dal, all on the same vein. The plant is erected on the Becker location, and consists of a complete 20-stamp mill, large boarding-house and offices. The Becker is developed by a tunnel 1320 feet on the vein, which out the vein 400 feet deep. The first shaft is sunk from the bottom of the tunnel and 125 feet from its mouth. The shaft is two-compartment, and is down 300 feet below the tunnel. This shaft is also extended up to the surface, where a steam-hoist is erected. When water is plenty the shaft is worked through the tunnel by water-power; but in times of scarcity of water, the steam-hoist on the surface is called upon. The first shoot of ore on the Becker has been driven on for a distance of 230 feet, and the end not reached. The ore in this shoot averages four feet in width of \$6 ore. The second shoot is 268 feet long, with an average width of six feet, and value of \$6 per ton. In the main tunnel south, 920 feet, a shoot of ore has been encountered which has not been driven through, as

yet, to determine its extent, the vein at this point is 16 feet in width.

Blue Ball.

Mr. Alf. Tredidgo is superintendent of this mine, which is on the north bank of the south fork of the Yuba, and is on the Eagle Bird vein, and adjoins the Eagle Bird property on the north. The mine is opened by shaft to a depth of 300 feet, with drift of 250 feet on the 100-foot level, and the same length of drift on the 200, with the vein averaging five feet in width of \$6 ore. The 300-foot level is now in good ore. The mine has a 10-stamp mill. The past record of the district is good and the future still more promising.

E. H. SCHAEFFLE.

Pacific Coast Marble.

EDITORS PRESS:—Having been a constant subscriber to your paper from its first establishment, I often notice articles in relation to marbles of various kinds being discovered in different parts of the country. It has often brought to my mind a deposit which I discovered on the Humboldt river when crossing the plains in 1850. I was on horseback riding along the road, when I discovered a singular-looking black rock rising up out of the level plain about 20 or 30 feet long, 10 or 12 feet high and the same in width. Back of it perhaps 100 feet, more or less, arose the hills or mountains skirting the valley, which I noticed to be of the same material and had that rough pitted appearance which all marbles have on exposure to the atmosphere for ages, and was hard and destitute of vegetation. It looked so black and firm that it attracted my attention, and I broke off a piece and put it in my traveling bag and brought it to California with me. It remained in my bag until 1861, when the Comstock mines were discovered, and, seeing some of the black ore from those mines, it reminded me of my specimen from the Humboldt, and I immediately hunted it up, but on comparing I found they differed very materially except in color. I then went to work and polished it, and found it to be a beautiful specimen of black marble with fine white and variegated streaks running through it, resembling what I have heard called Egyptian marble.

From the Central Pacific Railroad maps and my journal (which, by the way, I still keep), it must be very near Golconda Station, on the C. P. road, on the north side of the river, and cannot be over one mile from the railroad. If there are any of your embers living in that vicinity, I think it would be well for them to look it up. If I were in a condition to do so, I would go there myself and hunt it up, as the place is so vividly impressed on my mind I think I could go directly to the spot. There is also another deposit of very white marble at the junction of the Fort Hall road and Hedgepeth out-off road, near Raft river. It lies in an immense bed 20 to 40 feet thick, but I suppose that is out of reach of transportation. I also brought a piece of that with me to California the same year.

San Diego, Sept. 16, 1891.

W. A. BEGOLE.

The River Mining Dredge.

EDITORS PRESS:—The Carson River Placer Mining and Dredging Company are working in the tailings deposited in the river by several mills up along the river. The claim of this company is from 100 to 200 feet wide and several miles long, and contains quicksilver, sulphurets and gold. The deposit is from 15 to 25 feet deep, over virgin soil of 5 to 10 feet. The assay is all the way from \$2 to \$120, besides quicksilver from 1 ounce to 14 ounces.

Mr. Angel has the contract of replacing the scoop with a bucket dredger which will raise 600 to 700 tons per day. This passes through the belt amalgamator and separates anything free, and from the amalgamator over sluices to the concentrators.

The company has experienced some difficulty in getting the proper machinery for handling successfully this form of mineral deposit, but feels confident of success in their present effort, as this system of mining is better understood than formerly. The company estimate the cost of operation at 10 cents per ton, and if success crowns their present efforts, they have a life-work before them. Mr. Roe is the business manager and takes pleasure in panning out some of the river-bed gravel before your eyes.

Dayton, Nev.

GARD KENNEDY.

An Electrical Chlorination Process.

The first practical demonstration of the extraction of gold by means of chlorine is, it is believed, due to the late Prof. Plattner, upon whose discovery all subsequent improvements are based. The most noteworthy modifications and improvements are those of Calvert, Jackson, Ott, Meares, Daeken, Patra, Rosner, Hanok, Newbery and others of less note. The introduction of electricity in the extraction of gold is of more recent date, and the leading names of those who first adopted this method are Ploehner, Ansel and Marie and Cassel.

Mr. Th. Ranft, M. E., of Sydney, has just introduced an electric chlorination process, says the *Australian Mining Standard*, in which he claims to have overcome the vital defects before experienced in electrical chlorination, viz., the getting rid of the sequent hydrogen and sodium as they are formed by the electric current when passing through the electrolyte. In

all processes where the hydrogen cannot be kept separate from the chlorine gas, the two will combine and form hydrochloric acid, which combination does not solve gold and is in every way most injurious to the process. The inventor does not claim or patent any new law, but an apparatus by means of which the laws observed are complied with. The apparatus consists of two cylinders, one within the other. The inner cylinder, made of a porous material, serves four functions, viz.: First as a filter; 2d as the negative pole or cathode; 3d, it acts as a burrette to allow the precipitated gold to escape along with the caustic soda, and lastly it allows the former hydrogen gas to escape at the top. The outer cylinder, which is air-tight (except at the places where it is required periodically to discharge), serves three purposes: Firstly, it forms the positive pole or anode of the battery, next it acts as a chlorine-gas generator and store, and lastly as the chlorinating vessel.

The process performed in the apparatus is described by our contemporary as follows: The ore to be treated (free of sulphur, arsenic, lead, zinc or bismuth) is mixed in certain proportions with common salt. It is then fed into the outer chamber, where the anode is, and the electric currents enter. Water is then added, which dissolves the salt in the ore, and this, combined with the saline liquor, forms the electrolyte. An electric current from a dynamo is then led into it by the anode, and passing through the solution into the inner chamber or cathode, is discharged back to the dynamo. The chemical actions produced by the passage of the electricity is to decompose the electrolyte into its elements. Hydrogen and oxygen are the products of water, chlorine and sodium those of the salt. Hydrogen being a positive substance, deposits on the negative pole; oxygen, on the other hand, being negative, deposits on the positive pole. Chlorine and sodium deposit respectively on the positive and negative poles. In order to prevent the accumulation of oxygen and hydrogen, contrivances are provided which continually wash the surfaces of the anodes to prevent polarisation, which would stop the whole process. With regard to chlorine, it has been established by Bisguet that chlorine in its nascent state is more active than afterward, so that if in the ore under treatment any gold is present, it would not be most readily attacked by the chlorine and form itself into chloride of gold (salt of gold), which again is soluble in water.

The gold now being in solution is readily acted upon by the electric current. The molecules, as established by Grothius, 1805, are under the same condition as any other molecules, which in their transit to the negative zone become split up into their elements, the chlorine parting and returning to the positive zone, whilst the gold is deposited on the negative pole in a fine metallic condition in the inner chamber. From this it is washed and drawn off in the contracted part of the inner chamber in conjunction with the caustic soda and passed through a filter. The powder is then calcined and the gold remains.

The gold having been extracted from the ore, the latter is drawn off at the bottom of the outer cell and an equal amount entering simultaneously at the top from a hopper, in which it has been mixed with the salt, makes the action continuous. In a working plant every ton of ore will be virtually from 20 to 24 hours under the chlorinating and electrical influence, and travel about 20 feet, which will give sufficient time for effective treatment.

As to the cost, adds the *Mining Standard*, it is estimated to be about one-ninth of the present cost of chlorination, or that 3.5d. per ton should cover the cost, supervision and sinking fund for capital. The inventor estimates the outlay for a complete plant to be £250, exclusive of an engine to drive the dynamo.

The Gravel Mining Industry.

A correspondent at Gold Run writes as follows to the *Colfax Sentinel*: "I was much pleased in reading your Dutch Flat correspondent's letter, and particularly that part which alludes to mining. Every newspaper correspondent should agitate the subject until the mining industry, that has been so long and so unjustly oppressed, be protected and again recognized, as it should be the foundation of every industry of the State. One year prior to the downfall of mining, the deep channel passing through Gold Run was opened by an expensive tunnel from Canyon Creek, powder alone costing over \$84,000. The claim was one among the first to be enjoined. The last run it made of 130 days it cleaned upward of \$100,000. From this point north three miles it is estimated it would take 40 years to work it. It would give employment to 300 men and give a net profit to its owners of \$300,000 a year. At Dutch Flat the channel is more developed, having been opened in several places, and is richer in character and all in readiness for working, with the best hydraulic machinery in the world. Crossing Bear river at Dutch Flat, we soon enter Little York and You Bet, which mines were unsurpassed in richness only by North Bloomfield and Cherokee Flat. These four mining camps would give employment to 1000 men and a profit to their owners of at least \$1,000,000 a year. North and south across the State we find the mines on this channel in a crippled condition and every industry suffering thereby. Should not something be immediately done? Take the taxable property of Yuba and Sutter counties to-day and com-

pare it with that of 15 years ago. Marysville, once the most prosperous business city of the State, surrounded with fertile soil, behind her inexhaustible mines, is a Chinese trading-post compared with what she was. What has done this? The question can be easily answered. Where is that great mining trade that once gave life and bustle to all around? Gone to Sacramento county, whose wisdom was proof against any affliction with the Anti-debris Association that has pauperized their county and done so much injury to the State. They say: "We admit the elephant cost too much, but the hay and harbor of San Francisco is worth more to the commerce of the world than all the mines of the State." The hay and harbor of San Francisco is as safe from injury by mining as the gulf stream.

"When the waters of the inland seas of the State were emptied into the great Pacific, it created a channel for everything to pass that must necessarily follow, but the Sacramento river navigation was destroyed before any mining had been done. How many a man of the days of '49 was derailed on the Hogsback; and now steamers of any size pass to and fro without difficulty. Can this fact be denied? We must admit that mining has ruined some valuable land and beautiful homes, but where one acre of good land has been ruined, fifty have been made productive that were worthless. Where one individual lost all, fifty have been made wealthy. This needs no argument. Every one who has seen the land subject to overflow by mud, will see the benefit of min-

Placer Mines

Being Run without Violating the Law.

The closing of the extensive and rich placer gold mines throughout California was a great calamity to the miners, says the Sacramento News. That it was necessary is generally admitted; but since the day the mines closed the question of how such mines could be worked without detriment to the navigable and unnavigable rivers of the State has been a matter of much speculation. Every one has confidently believed that the time would come, and at no distant date, when the interests of the miner and farmer would be harmonized. For a time the miners hung their hope and faith in the Legislature, but the problem proved too much for them.

Geology, enterprise and the development of the fruit industry of the State, it appears, are about to open the throats of the rusty monitors.

Without assuming to be prophetic, it is not too much to say that at the very least the question has commenced to ravel, and the solution is not far distant.

Among those who are taking practical steps to reopen the placer mines may be mentioned the Hill Top Company of Sacramento county, operated by Ballard & Byam, and the Forest Home mines, Amador county.

The Hill Top Company has been operating for the past three years from four to six monitors, being run continuously night and day.

The modus operandi was explained by Mr

The Migration of the California Sequoias.

[Graduating essay of Mr. CHARLES PALACHE of the class of 1891 of the University of California.]

Ask an Arctic explorer to tell you of the forests that clothe the regions of the far north, and he will describe the shrubs and tiny flowers which alone represent the floral kingdom in those desolate regions.

Yet by proof that is incontestable, we know that, at a period geologically recent, the polar zone was the seat of the grandest and most varied forest growth that has ever existed on the face of the earth.

There, circling the pole, in a climate differing not much from that of California, flourished the ancestors of the trees that now, widely scattered, find their homes in Asia and on the slopes of the Pacific ranges; trees that skirt the western shores of the Atlantic, and border the seas of Southern Europe.

A polar forest! where, wandering in imagination, we may see tree upon tree so like to its congener of the present day that the botanist alone may discern a difference; where, lord of the forest, the giant Sequoia overshadows with its mighty dome the noblest of its rivals.

The genus *Sequoia* consists of but two species, the Redwood of the coast and the Big Tree of the Sierra, both found in California alone, and there in localities most remarkably isolated. These two trees lack all connecting link

But how with plant life? Must not these vast forests of sub-tropical trees perish in the van of the glacier? Surely they cannot fly the advancing ice flood! No! as individuals they must die; but so slowly comes the change that many are enabled to modify their functions for existence under new environments, and the new generations move with a common instinct ever southward. The most conservative estimate makes the Sequoias of our day as old as the Christian era, and a thousand years is, therefore, a moderate allowance for a generation. Judge, therefore of the lapse of time needful for the passage of this majestic procession, where every step consumes ten centuries.

Types not readily yielding to the modifying influences perish. In the tramping, pushing throng of refugees, many are trampled under foot. Many, as invaders, struggling for possession, fall before the inhabitants of a new land. What wonder, then, that species are lost. Surely here must be the "survival of the fittest."

We have seen that in the circum-polar forests the species were somewhat uniformly distributed. The disturbing cause was at or near the center of the zone. Hence, as each species would seek the shortest route to safety, we should expect great similarity in the forests of all the northern continents.

But on the contrary, we find the greatest diversity, and the explanation of this apparent anomaly is found in the diverse conditions which were met along different lines. In one direction a species might find all things favorable to its continuance; in all others the obstacles were insurmountable, and it perished. Or the species might perpetuate itself on two widely divergent lines. And accordingly we find many American species duplicated or paralleled in Asia, while as a whole the floras are so different.

In the light of this history, revealed by geology and interpreted by evolution, we can read plainly the story of the California Sequoias. Twenty species at least started on the long journey toward the equator. In the struggles that ensued all save two perished, leaving in the rocks of Europe, Asia and America memorials which might testify to the former greatness of the race.

It is a law of evolution that species reach their highest development in size and function shortly before their extinction. Since we can not believe that Sequoia can surpass its present self in bulk, grandeur or beauty, we should be forced to the conclusion that it is the last of a long race, whose end can not be distant were it not that a new and most important factor has appeared to modify the law. Man, so potent an agent in the destruction of many types, will here become the savior of a race, for through him the countries that knew Sequoia centuries ago only to lose it, will again be stocked, and the tree will begin a new era of its long life history.

In California's fairest Sequoia grove there stands a noble tree, bearing the name of one who has lately gone from our midst, revered, beloved and lamented.

The tree is the embodiment of all that is noble, beautiful and perfect in the floral kingdom—a summation of types, a monument of ages.

The man was the embodiment of truth, beauty and nobility—the undying characters of manhood.

What more fitting memorial could mind devise or nature evolve to perpetuate the name of one whom we remember but to admire and emulate?

[The touching allusion with which the essayist closes is to the late Prof. John Le Conte, who died but a short time before commencement.—EDS. PRESS.]

The Real Rain Maker.

WASHINGTON, September 14.—The real inventor of the rain-producing process has been discovered in the person of General Daniel Rogers of Fredericksburg, Va., to whom a patent was issued ten years ago. He served in the Mexican war, and at the breaking out of the civil war cast his fortunes with the South, the result being that he came out of the army impoverished and broken in health. He is now over 80 years old, and for a number of winters he has been endeavoring to enlist aid from Congress to make the very experiments that have been made and are to be continued under the supervision of General Dyerforth. He finally secured the assistance of Senator Farwell, who offered an amendment to the general Appropriation bill whereby \$10,000 was set apart for the proposed experiments. It was stipulated in the amendment, however, that the experiments should be conducted under the auspices of the Department of Agriculture. It is understood that a syndicate of Washington capitalists, satisfied that the invention has proved a success, have offered General Rogers \$75,000 for his patent, their idea being to sell it either to the general Government or to the several States.

A SUN-BURST.—A luminous outburst on the sun was observed by French astronomers on the 17th of June. First appeared a luminous spot of a yellow golden tinge, soon followed by another just above it. The spectroscopic showed the first spot to consist of a central eruption, from which volcanic bombs were thrown to heights above the chromosphere, where they seemed to rest as dazzling halls. A few minutes later these were replaced by brilliant jets or filaments.

ON THE SUMMIT OF MT. TAMALPAIS.

ing to worthless land. One instance to prove this: The Cherokee Flat mines destroyed their outlet, Dry creek, embracing 300 acres of fine land and eight or ten beautiful homes, which they paid dearly for. Their tailings spread far and wide over the plains that were worthless for even sheep-grazing, and now they have more than 7000 acres of as good wheat land as there is in Butte county.

"Is it not time the mining interest was protected? Every industry of the nation and State demand it. Should it not at least enlist the sympathy of that government that has so long raveled in its spoils? Hundreds of millions invested in it are idle and perishing, where millions were produced and put in circulation to the growth and prosperity of our loyal State."

The Summit of Tamalpais.

Many who gaze upon Mt. Tamalpais from the great region of sea and bay, hill and valley, plain and populous town which lies spread beneath it, will be interested in a view of the actual crest of the mountain as shown in the engraving on this page which is made from a recent photograph.

Mt. Tamalpais is the greatest elevation which can be seen to good advantage from San Francisco and the region of the bay north of San Francisco and Oakland. It is true that we can look from the metropolis across the hills back of Oakland, and see the broad back of Monte Diablo and sometimes from our hilltops we can catch a glimpse of Mt. Hamilton east of San Jose, but Tamalpais is the only height of which we have a close view. Its shapely proportions and the colors which play upon its sides at sunrise and sunset make it a subject of constant adoration from city and suburban gazers.

Tamalpais is reported as 10 to 15 miles distant from San Francisco according to different estimates or measurements. It is located in Marin county and is consequently northward from the city, and on the northern side of the narrow channel by which ships pass back and forth from the Pacific through the Golden Gate.

Ballard, the superintendent, to a representative of the News.

"Certainly," said Mr. Ballard, to the reporter, "I will explain our method of operating. It is most simple, and is one which I believe will be generally adopted.

"Our company owns a valuable water-right, and was operating extensively at the time the mines throughout the State were enjoined. The question with us, as with all the other mines, was what to do with our debris.

"The company finally purchased large tracts of valley and foothill lands located some 15 miles below the mine, and at great expense an irrigating ditch was constructed to the tract.

"We now had a means of disposing of the water, which, after being used in hydraulic mining, was so objectionable to the Anti-debris Association.

"We had yet to dispose of the gravel and heavy sediment, and we resolved to try an experiment. We applied and secured permission of a farmer owning a large tract of dry foothill land adjoining us, to run our debris and water upon his property, explaining, of course, our purpose. Dams were constructed of earth across dry and rocky ravines, and from time to time as they filled up, we raised them. We settled all the heavier particles of debris carried by the water on this farm, and took the water up below in our ditch, which we conveyed to the company's tract for irrigating purpose."

"We managed to fill place after place with coarse gravel and as it leveled up, the current was checked, naturally finer particles settled and formed a fine soil.

"The result is, that now, after three years' run, we have made the farm one of the most valuable in the county. Where, when we commenced work, the land produced only a small crop of short annual grass of no value worth mentioning, now it produces a heavy crop of green feed the year round. The owner has become one of the most prosperous cattle men in that county, and the value of his land doubled.

"This same system is being put in operation at Forest Home, some miles above us. It appears to me to be the only practical one."

with the other members of the Cypress family, to which they belong.

Along systematically and geographically; hoary with age; wonderful in bulk and stature, and seemingly immovable as the hills—they stand. Imperatively the question arises, Whence come they? Did they spring where now we find them, full nurtured from the hand of the Creator? Are they the forerunners of a new race just entering upon its course? Or are they the last scanty remnant of an exhausted stock, now tottering to its fall?

Let us see if geology will not, as a master-key, unlock for us the dark volumes wherein, with fossils for her symbols, nature has written the answers to these riddles.

The book of Time has told us that of the Tertiary circum-polar forest, Sequoia was an integral part, exhibiting many species and connected by existing forms with its ancestors.

Evidently our tree is not a new one! Yet how came it here? By what magic were our groves transplanted from the pole, and why are we alone the fortunate inheritors of this great legacy of the ages?

We read the answer in a new chapter of the earth's history—the Glacial Epoch, or great Age of Ice.

The canons leading to the accumulation of the vast ice mantle, which, with steady advance, spread chill and desolation over most of the Northern Hemisphere, are yet but vaguely understood by geologists. Certain it is, however, that, beginning at the end of the Tertiary Period, there was, throughout the polar regions, a slow and constant fall of temperature, which in the course of centuries produced an entire change in the climate of that zone.

And as the correlative of this change began a migration, the most remarkable that the world has seen, a flight for existence of a whole life system. For slow as was the advance of the ice wave, immediate and sensitive was the response of fauna and flora, and hence their retreat.

For the animal kingdom it was an easy matter to yield to the pressure of an uncongenial climate, and southward wandering, seek new homes.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Alameda.

SALT-MAKING.—Haywards *Journal*, Sept. 19: Your reporter this week paid a visit to one of the chief industries of Mt. Eden—salt-making—this week, and buckling on our "salt shoes," spent a pleasant and instructive visit along the salt marsh. The largest manufacturers, of course, are the U. P. works. We find that the local output this year by them will reach 10,000 tons. Next comes P. Maricano with 3000 tons from five ponds. Then comes D. Pestdorf with 1500 tons in sight and clear weather will add another 1000 tons. Mary Mickelson will have 1000 tons and the Oliver Bros. the same amount, and L. Whisby a like amount. C. Madsen has 300 tons in sight and with any kind of good weather will secure 700 tons, H. P. Jessen will have 400 tons, Claus Pestdorf, 300 tons, Janies Tucksen, 300 tons, besides shipping 300 tons, Chris Green, 250 tons, Mathiesen Bros., 200 tons. In regard to the effect the rain will have on the salt, the most extensive damage will result to the salt in the ponds.

Amador.

FREE OF LITIGATION.—Amador *Ledger*, Sept. 19: The attachment suit of George Newman against the Clinton Con. M. Co. was settled last week, the defendant paying the amount claimed and the costs being divided among the parties. The suit against the Macato mine has also been dismissed, so that the Clinton Con. is now free from all legal entanglements. The Plymouth Con. will start 20 stamps in a few days. The Bunker Hill paid one-half of last month's wages of the employees and promises to pay the balance the end of this week. Lumber is being hauled from Whitmore's mill to the New York mine in John Bull's gulch, to be used in the construction of a mill building there. The machinery for the large Huntington mill will be shipped just as soon as they are ready for it. The Clinton Con. paid off its employees in cash at the mine on the 16th. Heretofore the men have been paid by checks cashed by business houses in Jackson. This involves a trip to town to get the money on the checks and consequent loss of time. Payment in coin is much preferred by the workmen.

FROM SUTTER CREEK.—Cor. Amador *Ledger*, Sept. 19: The work of drifting on the North Star is being pushed with all possible speed. Although over the boundary line, the lease they have secured will enable them to continue exploration indefinitely, or until they are satisfied. Sinking at the South Eureka is progressing in a satisfactory manner. They are already down 150 feet. The ground is quite soft, which enables them to make rapid headway. Buildings are being erected for protection against winter storms. Some changes are being made at the Lincoln mill. As the north portion of the mill about the mortar docks, guides, etc., is giving way, they are moving the stamps to the south end, where the mortars and framework are good. This will enable them to run 15 or 20 stamps for years to come, that is, as far as the stability of the mill is concerned. The ore now being crushed is of fair quality, and Chas. Smith, the millman, is apt to work it for all it is worth.

THE SILVER STAR MINE.—*Dispatch*, Sept. 19: This mine, located near the Gate, and which is just being developed by Messrs. Mello & Co., is turning out to be a first-class mine. We were shown some extraordinarily rich rock taken out of the mine a few days ago, which was literally filled with free gold all through. Their little mill was doing good work, and a "clean up" last week showed that the ledge was yielding fully as well as the owners had any reason to anticipate. We understand the mine has been bonded to capitalists below for \$20,000, and that they will soon commence working it on an extensive scale.

ANOTHER QUARTZ MILL.—The grading for the site of a 20-stamp mill at the New York mine, about three miles below town, is nearly completed, and the work of erecting the mill will be commenced next Monday. A portion of the machinery for the mill has already arrived at Ione and will be hauled up as soon as needed. The mine has been pretty thoroughly prospected under the able management of the superintendent, Mr. W. G. Anderson, and the owners were fully convinced of its value and permanency before they would go to the expense of putting up a mill.

Butte.

GOLD POOR.—Oroville *Mercury*, Sept. 18: Much has been said and written about the undeveloped mining sections of this and adjoining counties, but it is seldom we hear the expression that any community of people is "gold poor"—that is, gold poor in the same sense that men are land poor. A *Mercury* reporter this morning, in conversation with A. Ekman, the well-known assayer, who has recently been on a trip through the Sierras, heard that expression. "The people of the mining regions adjacent to Oroville and extending into Plumas county don't know their wealth," said Mr. Ekman. "They are actually gold poor; that country is covered with ledges teeming with gold, and comparatively little of it is extracted. What that section needs is more capitalists and more scientific miners." Two new mills are being built in the Spanish Ranch region—one of 10 stamps and the other of 20.

Calaveras.

THE OLD UNION MINE.—*Prospect*, Sept. 19: Workmen have been engaged during the week in hauling timbers from Mr. Ratgeb's mine, near the Boston, to the Union mine, which also belongs to that gentleman. We learn that Mr. Ratgeb is about to retimber the old shaft on the Union, and will then proceed to work it on an extensive scale.

GRAVEL MINING.—Hugh McCosley of Mokelumne Hill was in town Saturday last in company with C. E. Prindle of the Mokelumne Hill & Campo Seco Water Co., to make arrangements for the extensive working of his gravel mine near that place. The gravel deposits near the Hill have heretofore proved very rich and it is hoped that his mine will prove no exception to the rule.

ANOTHER STRIKE.—Last Thursday the men at work on the Venus quartz mine at Campo Seco to the number of 16 went on a strike, not for higher wages, but for what was their due. Several months pay is due to the men, and they came to town

Thursday night and filed liens on the property. The men say that the mine looks well with a good vein seven feet in width, and that at a recent cleanup over a thousand dollars was taken from the mill.

El Dorado.

PYRAMID.—Mt. Democrat, Sept. 19: The Pyramid mine, 12 miles west of this city, is being opened in good shape and a large mill will be erected on the ground. This promises to be one of the most extensive mining plants in this county. The ledge is large and crops out several feet above the top of the ground and is prospecting well in free gold. The Sailor Jack mine in Green Valley district is showing very rich ore. A tunnel has been run to tap the vein over 100 feet from the surface, where it is found to be two feet wide, of ore in which free gold is plainly to be seen through its entire width. A fair percentage of sulphurets is contained in the ore.

GREENWOOD.—Some very fine looking ore has been shown us from the vicinity of Greenwood, which has been attracting some attention. This ore seems to contain a large amount of lead and is said to carry \$2 to the ton in silver. It appears to be of a nature that can be worked by smelting. The Taylor mine is reported to be turning out some very rich ore. The Los Padre mine near Nashville seems to increase in width and richness as depth is attained. Some little water is encountered but not enough to materially retard work. The Church mine at the 600-foot level is sending up better ore than they have ever had above that level. At the Harmon mine an upraise is being made from the tunnel to meet a shaft which is being sunk from the surface. In both of these places the ledge is about six feet wide, of rich ore. The Gentle Annie is running regularly and making her usual output. The tunnel at the Blair mine is now in 1400 feet. It is the intention of the company to make an upraise into the gravel channel as soon as they have reached 1500 feet with the tunnel. Much interest is felt in this work as it opens a large extent of what is believed to be a rich gravel bed. Some encouraging new developments are being made in the Baltic district. It is reported that 10 stamps were started up at the Plymouth Con. mine on the 15th inst. The output at the Canada mine for the month of August was a little over \$40,000.

THE VAN.—Georgetown *Gazette*, Sept. 17: Present indications point to an early settlement of the Van mine difficulties. Connant stepping out and Baldwin & English assuming full control. If this be true, it will not be long before the Van will be equipped with a large mill and producing golden bars.

Fresno.

WEST SIDE OIL.—Fresno *Republican*, Sept. 18: Continued favorable reports come in from the Coalinga country regarding the oil finds in that region, and the work of developing is going on as fast as possible, the money being sufficient and the energy and experience not wanting. The oil fields of which there is the most talk, and in fact the only portion that is being talked about at all, is located on sections 17, 18 and 20 of township 19, south and range 15 east, or about eight miles a little east of north from Coalinga. The company which owns the claims on these sections is a Los Angeles corporation, and has hitherto done but little in the way of development. On August 4th the corporation, through its representatives, leased to W. R. Rowland and William Lacy the south half of all three sections, the consideration being that the development work should be pushed forward. According to the terms of the lease, Messrs. Rowland and Lacy must, within 60 days (before October 4th next), furnish the necessary derricks and drills for oil. The work must be prosecuted reasonably until oil is developed or until there is sufficient proof that oil cannot be developed. Messrs. Rowland & Lacy have been pushing matters since they secured the lease, and though the 60 days have not passed, they have the derricks and drills in position and had begun work. They have one well down a considerable distance and can take from it at least ten barrels a day now, and if it is agitated it will flow much stronger. They have pushed the work far enough to know that there is oil in paying quantities, and are now holding off a little until they can get everything prepared for handling the oil when they succeed in getting a heavier flow.

Nevada.

COTTON TAIL MINE.—Grass Valley *Telegraph*, Sept. 16: The Cotton Tail mine is located in Rough and Ready, on Torpie's farm. It is bonded for two years and is being worked by James Stead, Josiah Andrews, Oscar Patterson, Wm. Torpie and John Williams. The parties named have been working the mine, now at a depth of 25 feet, for three weeks and Friday night they brought to this office sample ore from the claim. It showed gold freely and the rock is of high-milling grade. The bonder, it seems, have a good prospect in sight. The hanging wall is slate and the footwall of porphyry formation.

ANOTHER DIVIDEND.—With most gratifying regularity for the past few months the Morning Star gravel mine of Iowa Hill has been declaring dividends. To-day No. 6 of \$1 per share was levied and payable at once. The Morning Star is destined to pay many more in the future with its capable management.

TO ERECT MACHINERY.—Grass Valley *Telegraph*, Sept. 18: The Jack Rabbit M. Co., encouraged by the result of their recent crushing at the Crown Point mill, and also by the present appearance of the mine, have purchased the hoisting and pumping works now on the Alaska and Ben Franklin mines. The machinery will be immediately moved to the Jack Rabbit and put in place for further developing the property.

CALIFORNIA MINE.—Wm. May has about completed his work in erecting the hoisting and pumping machinery at the California mine. To-morrow steam will be started and on Monday next it is expected that the work of sinking the shaft deeper will be begun. A battery will be immediately built and soon the company will have its own mill complete.

W. Y. O. D. MINING CO.—Grass Valley *Union*, Sept. 18: The annual meeting of the W. Y. O. D. Mining Co. was held on Tuesday, at which J. R. K. Nuttal of San Francisco, Joseph and Jacob Weissbein, C. A. Brockington and W. J. Connors of Grass Valley were elected directors for the ensuing year. The Board organized by electing Mr. Nuttal as President, Mr. Connors Vice Pres., Jos. Weissbein Sec'y, and Weissbein Bros. & Co. Treas. C. A. Brockington was reappointed Supt.

Placer.

HOMESTAKE.—Placer *Herald*, Sept. 19: The Homestake quartz mine, near Forest Hill, owned by Remler, Russell, Bilkey and Neal, is said to be looking fine. At present the mill is closed down to allow them to put in a 30-foot overshot wheel in place of the Hurdy, as they have hardly water enough to run the latter.

Plumas.

GREEN MOUNTAIN.—Greenville *Bulletin*, Sept. 20: G. P. Cornell, owner and superintendent of the Green Mountain mine, went to Oakland, last Sunday, taking his family with him. Mr. Cornell will return in about ten days. The work at the mine is in charge of Foreman Ghidottie, who informs us that work is progressing very rapidly. In the work of opening up the tunnel he expects that in two or three weeks, the back chute will be reached.

San Bernardino.

TEMESCAL TIN.—The following communication, signed by S. Harris, mining manager of the Temescal tin mines, appears in the South Riverside *Bee*, Sept. 16: So many damaging reports being in circulation the past week or two respecting the change of management and the mode of working at these mines, which is quite misleading to the public, and in duty to myself wish the facts to be known. I observe in the *Perris News Era* a paragraph headed "Cajalco Cornishmen," that Americans are being discharged at Temescal tin mines to make room for aliens. This I totally deny. I have been here in charge of all mining work three months; during that time not a man of any class has been discharged, in fact we have been constantly increasing. We have now employed here close on 100 men, all on practical mining work, and I can fearlessly say, out of that number we have only five Cornishmen on the works that have come to this country within the past five years. We have about 15 here that claim to be Cornishmen, but have been in this country varying from 15 to 30 years, and never intend returning to the old country again. I also observe in the same paper another paragraph headed "Temescal Tin—Is the Output to be Restricted for England's Gain?" What sane man could imagine, after a company spending three-quarters of a million dollars, as this anonymous correspondent puts it, would in any way try to restrict the production in favor of or to benefit the Cornish producer. I can assure him it is not so, but they wish us to raise and to bring to market every pound that can be judiciously done. The present management don't believe in leaps and bounds, but go steadily and cautiously on. In this way we hope and expect to lay open a permanent and profitable mine, pay the company back their money with good interest, and prove a blessing to this neighborhood.

San Diego.

RICH STRIKES.—Julian *Sentinel*, Sept. 17: The rich strikes that have of late been made at the Stonewall, Helvetia, Gold King, Cincinnati Belle and Warlock mines have sent the camp merry on its way toward a prosperous winter. There are projects now on foot and others contemplated that, if consummated, will make Julian and vicinity, before December 1st, one of the liveliest camps in Southern California.

AT THE HELVETIA.—The rich find at the Helvetia continues to be the all-absorbing topic of the time. As to whether or not the rich lead now being worked is the Old Helvetia ledge, there is a diversity of opinions among miners. If it should prove to be the original Helvetia, the rock now coming out affirms the popular belief that when the Helvetia stopped work years ago there was still rich ore in sight. If the rich strike is not on the Helvetia ledge, then Mr. Havermale is to be congratulated indeed in the certainty that exists of still another rich strike when he encounters the Helvetia ledge proper. One strong circumstance that tends to prove that the recent find is a new and distinct ledge, is the fact that no water has been met with in the drifts, while the Old Helvetia was continuously troubled in this respect. Be it one or the other ledge, the truth stands forth clear and bold that the rock now being taken out of the lower levels of this mine has never been surpassed by any mines in this camp, even in the palmy days when the Banner mines were turning out fabulous wealth. It is no word-painting or stretch of the truth to say that some of this quartz is literally stuck together and binged with gold, and this not in mere isolated pieces or specimen rock, but great chunks of ore coming up with each bucket are scored and seamed, flaked and spotted with the precious metal. It is open to any one to verify these statements by a personal inspection at the shaft-house of the mine, where the buckets rise every few moments and dump their contents. Here there is no attempt made to conceal, diminish or exaggerate the truth. Particular significance is attached to this strike as going to show that the Julian mines are not all on top the soil; that there is gold beneath the grass roots and that too in magnificent quantities. All that is needed in Julian as in any other gold camp is for individuals or companies to apply capital and industry with a proper amount of skill and patience. At the time of our going to press the men at the Helvetia have proceeded along the vein 30 feet from the point where the strike was first made, and there is as yet no abating of the rich rock. An encouraging feature is that the vein is wider on the bottom of the level than at the top, which goes to show that the biggest end of the strike is still farther down. George Plant and C. E. Smith have been busily at work on the ledge near the old Washington. They worked like beavers and have driven a 35-foot cut and a 40-foot tunnel toward the main ledge within the past ten days. They expect to strike good rock within a few days. The Warlock mine is continuing to yield the boys rich returns. Another crushing will soon be made.

San Luis Obispo.

OUR ASPHALTUM INTERESTS.—Attoyo Grande *Herald*, Sept. 19: One of the interests of this part of the county is now attracting some attention. On many occasions we have, through the columns of this journal tried to interest some of our local capitalists in the vast beds of almost pure asphaltum that lie within a stone's throw of our depot. Up to the present time, however, our advice and suggestions have been unheeded. Now, glad to notice, a couple of enterprising gentlemen from Los Angeles, Mr. Hutton & Co., have leased the asphaltum deposit of Mr. Sanford, which is known as the Tar Springs. They are now putting up works for the purpose of eradicating all the refuse material so as

to enable them to transport nothing but the pure article to market. Our asphalt beds extend from within a few hundred yards of our railroad depot to the Tar Springs, a distance of ten miles, with here and there a spring where the pure stuff is oozing out at the top of the ground. There is one of these springs on Mr. Sims' ranch near the mouth of Tar Spring canyon, another on Madam Tapia's ranch, one mile above. Mr. Sims has run a 40-foot pole down his asphalt spring without finding bottom, which proves that the supply is inexhaustible while the quality is equal to that of Mr. Sanford's tar spring. We understand that parties are negotiating for this property with a view of opening a mine and preparing the asphaltum for work. Mr. Hutton informs us that the material is making quite a reputation in Los Angeles. Asphaltum is being used there from all over the county, and they find from experience that the asphaltum shipped from this locality is much superior to that from any other. He is now at the ranch preparing to mine it more extensively than ever. In the light of this information it is probable that the shipment of asphaltum from this locality will be greatly increased and the deposits become more valuable.

Shasta.

SHUT DOWN.—Redding *Free Press*, Sept. 12: The shutting down of the Walker Bros.' (of Salt Lake) mine in the Old Diggings mining district has been a surprise and somewhat of a mystery to many, as it was well known that the ore taken therefrom was rich. But a visit to Mr. Rippetto, Supt., explained the reason. The rock is of high grade, but from some unexplained cause no process now in use will save the gold.

CALUMET.—Ore from the mines of the Calumet Company, on Flat creek, is being hauled to the new mill of the Shasta Gold Extraction Company, and will be worked by the MacArthur-Forrest process. The Calumet Company owns five mines on Flat Creek.

A PROMISING MINE.—Cor. Shasta *Democrat*, Sept. 16: Being called upon to visit a mine belonging to David Pesenti, situated between Spring and Flat creeks, about 1½ miles west of the Sacramento river, I found that he had a good-looking vein. I made several tests of the ore and it runs high in gold, to make it a good investment for capital that is seeking mines. The strike of this vein is nearly east and west, with a dip of 82½ degrees to the north, easy of access, and as far as development work has been done, proves the continuity of pay rock. He has run a crosscut 32 feet to strike the vein and 34 feet on vein west, which gives 35 feet vertical depth in the drift and on surface has uncovered the ledge for about 75 feet, with cuts and shafts here and there, and from floor of tunnel to surface the assays will average over \$60 per ton. As Mr. Pesenti worked 1½ tons in an arrastra, the returns I saw from Selby's—\$58.40—go to prove that this mine can make a good showing, as this was only the free gold that was saved, for sulphurets cannot be saved with the arrastra. This county has undoubtedly many more such propositions if they were only uncovered, and, using the prospectors' own phraseology, "strike it rich." Her gulches were rich with gold that came from the veins that course along her mountain sides, and all it lacks is energy to bring Shasta county to the front as one of the great bullion producers of the State.

SOME OF THE MINES.—Redding *Free Press*, Sept. 19: The following is a list of some of the mines of Shasta county, ores from which were exhibited at the late Shasta County Fair. The mines are all good and the ore averages well. First is the Summit mine, located at Sunny Hill, which is owned by the Bell Bros., and has been operated for over one year, the ore being shipped and getting large returns. The ore averages from \$200 to \$270 net per ton. The mine was operated unsuccessfully by other parties, who endeavored to work the ore by the common free gold process. The Black Bear is located on Muleton mountain, and is owned by Judge Bell, Jos. Bell and Sheriff Hopping. Ore shipped has netted as high as \$600 to the ton. A shaft and short tunnel has been run, and recently a tunnel has been started to tap the ledge 200 feet deep. The Gray Eagle, also on Muleton mountain, is owned by Judge Bell, Sheriff Hopping, the estate of Geo. Knox, and Kahney, the brewer. A couple of shafts have been sunk, showing ore that will assay as high as \$600 per ton with a strong ledge. Prospects are favorable for a fine mine. The Price mine, at Centerville, is owned by Tom Price and shows some very good ore. There is very rich ore exhibited from the Sky Blue mine, near Middle Creek, owned by Biegle, Bugbee, Becker and Bouk. This mine is undoubtedly a continuation of the old Bunker Hill claim. Considerable work has been done and the ore is of high grade. The Pfeiffer mine, on Salt Creek, had on exhibition some very good ore. A small sample of ore was exhibited from the Thompson mine, located at the Swasey place. Considerable development has been made on this mine. Ore from the Trinity and Mollie mines, in the Dog Creek district, was very rich. These mines are owned by a large company, and thousands of dollars have been spent in putting up mill, erecting a boarding-house and building a road, but as the ore is not free milling, the managers are considering some process which will extract the gold from the ore, rich by assay. Silver ore was on exhibition from the Crystal, Black Prince, Wright & Son's location. These mines are located in South Fork district, near Igo. The Crystal is owned by Henry Rothwell, who has recently discovered some extra fine ore, assaying from \$700 to \$800 per ton. The Black Prince is a contiguous location, owned by Robinson & Sons, in which there has been recently some fine developments. J. P. Wright & Sons' location is also near the Crystal. It is a recent strike. The ore placed on exhibition showed up brittle silver, and is worth at least \$800 a ton. From French Gulch there was exhibited ores from the J. I. C., Wheeler and Gopher mines, all gold and rich. These mines are not fully developed, although considerable work has been done. They are contiguous to the Gladstone, a mine which is fast going to the front as a dividend paying mine. Matt Hume had ore on exhibition from a mine on Iron Mountain. The ore is good. It is owned by Hume, Dix and others. There were two mines represented from Flat Creek district—the Presenti and the Spelman locations. The former is owned by David Presenti and H. Cineschmidt. The ledge has been uncovered for about 75 feet, and a crosscut 32 feet has been run to strike the vein, and 34 feet has been run on the vein west. From cuts and shafts here and there, the ore

will average \$50 to the ton. The Spelman mine is owned by John Spelman and Dan Haskell.

Slakiyou.

QUARTZ.—Yreka Journal, Sept. 16: We learn that a rich quartz ledge has lately been discovered on Six Mile Creek, at South Fork of Scott river, above Callahans, by a man named Short. Twenty-five pounds of the quartz lately taken out was at least half gold, and caused considerable excitement at Callahans and vicinity. A man named Reibolt, from San Francisco, who bought an old condemned placer claim on the same creek a few years ago, has also found very rich prospects. Clark & Heckathorn, of Greenhorn, are finding very rich pay in their quartz ledge on Greenhorn, near the Big Spring. They have a body of decomposed quartz and paying dirt about six feet in width, prospecting to a depth of 15 feet and about 700 feet long, which pays not less than from \$5 to \$100 per day to the hand by washing in a rocker, and laying the hard pieces to one side for crushing hereafter in a mill. They have only water enough at present in the spring to work a rocker, but intend running a couple of trenches toward the summit of Deadwood mountain, so as to gain the benefit of the melting snow of winter in washing the decomposed quartz and ground in sluices. Chas. Lunger visited the Empire quartz mine last Saturday, at Klamath river, in which he has a force at work running a tunnel to strike the ledge lower down. The tunnel is now about 119 feet long, in very hard base rock, with expectation of soon being completed to the ledge. As soon as sufficient water is obtainable for running the mill, a large lot of quartz on the dump at the upper level will be crushed. The Allen Bros., of Quartz Valley, have been doing very well in their quartz mine this season by getting the quartz crushed at the old Johnson mill, near Mugginsville. The ledge averages about a foot in width, and yields from two to four ounces of gold per ton. They have just received hoisting machinery, which arrived at the Yreka R. R. depot this week, and is now being hauled to their mine by returning teamsters hauling wheat from Scott Valley. This machinery is operated by compressed air under the working of steam engine, and can also be used to good advantage in furnishing pure air in the tunnels if needed.

GRAVEL.—The shaft in the Yreka blue gravel claim is now down over 100 feet from the surface, with the ground of very tough like blue cement. As soon as softer ground is reached, it will be a very good indication of nearing bedrock. It was expected that bedrock was not over 100 feet down, and may come in sight before sinking many more feet.

GOLD.—The members of the Chinese Co., working the old Bentz Bar claim, Klamath river, just above Honolulu, are reported as taking out gold dust in great abundance, as rich as ever realized on that rich-yielding stream, but no one can get any figures, as the Chinamen "no sabbee." James Wheeler of Yreka visited the cinnabar mine on Siskiyou mountain last week, going by buckboard from Quigley's on Klamath river. He brought several specimens of cinnabar to town, which, on being pounded in a mortar and washed in a pan, exhibited an exceedingly rich prospect. The furnaces are about completed for commencing the reduction of ore, but the machinery for retorting has not all been received yet. Hard wood is to be used principally in the furnaces.

Trinity.

NEW RIVER.—Cor. Trinity Journal, Sept. 19: Our energetic and enterprising miners are busy at work every day, penetrating the bowels of the earth in search of lucre. F. Colegrove, the worthy superintendent of the Excelsior mine, is very much elated over a rich streak of ore he discovered about three weeks ago. Bowerman & Fillmore, who have a lease of the Excelsior, have several men employed in getting out ore, and manage to keep their mill in motion day and night. The Mountain Bomber mine, owned by Clement & Ladd and leased by Leas and Nickolson is producing abundance of rich ore this summer, thereby giving Mr. Ladd, who runs the Mountain Bomber mill, sufficient ore to keep him busy almost day and night. The Ridgeway Gold Mining Co.'s (consolidated) mine under the able management of its venerable superintendent, Maj. W. Toms, has quite a number of men engaged, and has been running a magnificent ten-stamp mill very successfully since they started up, six weeks ago. Notwithstanding that they run only 12 hours per day, yet they crush 15 tons of ore daily, and after they get to running day and night, which they expect to do in the near future, they say they can grind 30 tons daily.

Tuolumne.

VERY ENCOURAGING.—Sonora Democrat, Sept. 19: The Badger mine, owned by W. G. Martin of Rawhide and T. M. Yancey of Sonora, and which is under bond to J. Sevenoaks of San Francisco, is rapidly being developed at the 200-foot level, a drift being run north. In the face of said drift is $4\frac{1}{2}$ feet of ribbon rock which will mill \$40 a ton in gold and \$20 in silver. There is a tunnel running to intercept the shaft 800 feet away north, coming south, which will cut the vein 300 feet from the surface. Upon the whole, this is considered one of the best mines that has ever been opened in Tuolumne county.

MISSSED.—The amount of money put in circulation by the working of the Bonanza and San Giuseppe mines is readily missed since the stopping of those mines. It is estimated that no less than from \$1000 to \$1500 was paid out for labor on and supplies to these mines each month. However, the mines are valuable properties and will not be permitted to remain unworked for any length of time.

NEVADA.

Washoe District.

SAVAGE.—Virginia Chronicle, Sept. 17: During the week we have boisted 598 cars of ore from the 500, 750, 950, 1100 and 1400 levels, shipped to the Nevada mill 555 tons and milled 335 tons, average assay value as per battery samples of \$20 a ton. We have built on band amounting to \$14,636 30. On the 1500 level the north lateral drift from the Hale & Norcross side was advanced 20 feet; total distance, 130 feet from our south boundary. Face is in quartz, showing some fair grade ore. Ten feet back from the face of the north drift we have started east and west crosscuts.

HALE & NORCROSS.—On the 1500 level No 3

west crosscut was advanced 25 feet; total length 160 feet; face in porphyry. Winze No. 2, started at the end of No. 2 east crosscut, is down 83 feet. From this point we have started a west prospecting drift, which is advanced 8 feet. The main incline is repaired and retimbered 190 feet below the 1500 station and we will commence this week to open the 1630 level.

CROWN POINT.—South drift from west crosscut on the 500 level has been advanced 15 feet during the week and is now out 62 feet. At this point it was stopped temporarily and an east crosscut started from the end. This crosscut is now out 23 feet and has passed through a width of 4 feet of quartz giving low assays.

KENTUCK.—Have sunk the winze from the north crosscut on the 1000 level 4 feet during the week and it is now down 21 feet; the bottom is in low-grade quartz. Are still following the ore streak above the south drift from the north raise 1000 level which varies in width from one to two feet of rock that assays from \$20 to \$25 per ton. Have started a north drift from the Crown Point west crosscut on the 500 level to explore our ground in this direction.

JUSTICE.—The south drift No. 1 crosscut, 822 level, was advanced 9 feet during the week; total length 21 feet; face in low-grade quartz. The north drift on this level is out 826 feet, having been advanced 19 feet since last report; face in fair-grade ore.

BELCHER.—The west crosscut from the south drift from the 200 level has been advanced 5 feet during the week and is now out 77 feet. At this point it was stopped and a west crosscut started on the track floor at the foot of the raise and which is out 28 feet; face is in low-grade quartz, containing occasional spots of ore.

IMPERIAL.—The east crosscut on the 400 level is out 53 feet; face shows clay. Raise No. 3 from the 500 level is up 22 feet, having been commenced during the week; the top shows quartz of no value.

SEG. BELCHER.—The west crosscut from the south lateral drift on 600 level has been advanced 22 feet since last report, and is now out a total distance of 350 feet. The face of the drift is in porphyry, with considerable water running from it.

YELLOW JACKET.—No ore is being shipped, since milling is arrested on account of low water in the Carson river.

SCORPION.—The joint north drift from the 900 level of the Union shaft was advanced 24 feet, making its total length 447 feet; face in clay and porphyry.

CONFIDENCE CHALLENGE.—The joint Confidence-Challenge, west crosscut on the 230 level is now out 73 feet, face shows quartz of no value. North drift on the 300 level is in 423 feet; face shows quartz of no value.

CHALLENGE.—The joint Challenge-Imperial west crosscut on the 1100 level is out 166 feet, 20 feet having been made during the week; face shows a mixture of quartz and porphyry.

Jefferson District.

NUGGETS.—Belmont Courier, Sept. 16: James T. Darrough of Smoky Valley showed us on Monday last a number of gold nuggets and some gold dust which were found in Jefferson Canyon, Nye county. Mr. Darrough says that gold-bearing quartz has also been found and he believes that the owners of the claims will, in the near future, strike the ledge from which the quartz is supposed to come. He also states that Messrs. Stebbins and Corrallo, who are working the placer claims, have thus far made wages. It has been known for several years past that gold exists in Jefferson district.

Pahranaagat Lake District.

PROSPECTING.—Pioche Record, Sept. 5: Pahranaagat Lake Mining district, 60 miles west of here, is still heard from, though the boom looked for two years ago has so far failed to materialize, on account of the cessation of work by the U. P. folks on their road. But the few nervy prospectors still left in the district believe firmly in the future of that section and propose to see it come. The Balback mine owned by Henry Sharp Jr., is coming into prominence. The mine was bonded last year to Messrs. Barber & Silvia for six months, who prepared to work it, but ended with cleaning out the old drift and shaft, when they threw up the bond and left. Since then Sharp has worked the claim and now has a nice vein of ore exposed and the mine is withdrawn from the market. On this claim at the end of a 125-foot cut and drift, a winze is sunk some 60 feet on the ledge. Thirty feet down, a drift runs west 15 feet, showing 20 inches of high-grade ore. At the bottom of the winze, drifts run east and west. The east drift is in 15 feet, where 18 inches of ore running 200 ounces in silver per ton is seen. The west drift is in 30 feet and the whole face is ore, and has been for the last eight feet. This ore runs 80 ounces in silver per ton. There are 20 tons of ore on the dump and 20 more in the mine ready to hoist. This will be sorted down to about eight tons, to run about 230 ounces per ton, which will be shipped to Salt Lake. The balance will remain on the dump until a better market offers. On account of the distance nothing much under 80-ounce ore will pay to ship from that district. J. B. Gilbert has struck a nice vein of silver lead ore in the Carbonate claim which he located last January. Ore was found a short distance from the surface, and he now has a carload nearly ready for shipment, which will average 80 ounces silver per ton, and carries about 40 per cent lead. Lee Routzong is following down a rich seam of sulphide ore on an old relocated claim in Silver canyon and expects soon to make a small shipment. He is on a side vein, but is sanguine of encountering the main ledge soon. John Purtscher and J. C. Henderson are busy doing assessment work on claims they own there and have encouraging showings in a number of them. Mr. Sam'l T. Goodbe has let a contract to sink 50 feet on the old Buckeye claim on the north side of Silver canyon, and work will begin at once. This is the mine from which Howell and Lytle, five years ago mined a large quantity of high-grade ore, and which was milled there, their operations ceasing for lack of funds when the ore body pinched. It is confidently expected that the new work will result in a good find. Irish mountain, where all the above claims are located, is several miles in length, and it is boneycombed with ore veins and ledges and it only requires an expenditure of capital to make it one of the best mineral producers which this section of country has known. This may not be properly undertaken until a railroad is at hand to assist, but that time bids fair to come soon.

ARIZONA.

STOCKTON HILL.—Mohave Miner, Sept. 17: M. W. Scott and Dan Haskins have a lot of rich horn silver rock ready for the smelter which they will ship to Kingman next week. This ore is from the Esperanza, a fine mine near the old "og," long famous for its rich horn silver, and the Esperanza bids fair to become just such another bonanza. Messrs. Haskins and Scott purchased it last summer from George Lockwood and have had good ore in sight from the start. They have been working like beavers and deserve their good fortune. The assays run away up, and they will realize a snug sum from their shipment next week. They intend to work this property all winter.

ONYX.—Prescott Courier, Sept. 16: Messrs. Mason and Fisk, mining men from Los Angeles, leave to-day for the Big Bug onyx fields with a view of looking into the feasibility of handling the output of this remarkable deposit of valuable ornamental stone. It is said to be their intention to ship two carloads of onyx to San Francisco to be worked into various articles, but much of it will be used in finishing the inside of the famous Baldwin hotel. With cheaper transportation, which we will certainly have in the near future, the onyx industry will furnish its full quota to our material prosperity.

BRITISH COLUMBIA.

THE SKYLINE CROSSCUT IN ORE.—Ainsworth Hot Springs News, Sept. 12: For a month past, every claim owner in Hot Springs district has been anxiously awaiting the news that the crosscut from the bottom of the Skyline shaft had reached the vein. When the crosscut was started it was thought the vein would be reached within 50 feet, but that distance was run without encountering more than small stringers of galena. The rock turned extremely hard, and progress was slow. This week the face of the crosscut is in vein matter that assays \$63 to \$70 in silver, and is similar to that found on the hanging wall in the old incline shaft. Supt. McDonald is confident that he has the ledge, and his confidence in a great measure, is catching. The crosscut taps the ledge (on the incline) fully 200 feet from the surface. It is reported that the owners of the Skyline will now begin work on the Krao, on which they have machinery. They are also doing considerable work on the Libby, a promising claim on Cedar creek.

CONTINUES TO MAKE ORE SHIPMENTS.—The only mine in the Kootenay Lake country that is shipping ore at present is the Number One in Hot Springs district. So far about 150 tons have been shipped, the last shipment of 35 tons being sent out this week by the steamer Nelson. The ore goes to the smelter at East Helena, Montana, via Little Dalles and Spokane.

COLORADO.

A GREAT PLANT.—Aspen Times, Sept. 19: Fully \$250,000 is being expended by W. S. Morse, E. R. Holden and R. Cline in building the lixiviation works at Aspen. Everything about the establishment is of the most substantial nature. These men mean business. Manager Morse says they will start out by charging in the neighborhood of \$10 a ton for treating ores to make sure of a financial success, but after a while may be able to cut that a little. Even this will save \$5 to \$8 per ton to the miner, and as the works will handle ore that does not run over \$25 to the ton, 150 tons a day of Aspen's ores that now has no market will go into the general output. This will cause to be opened many new ore bodies. As soon as the works are under successful operation and the lower grade output sufficient to justify, these gentlemen will increase the capacity. Aspen can stand it if they extend the plant clear to the mouth of Castle creek. They are here to make money, but by so doing Aspen will receive great benefit and cheer them on. Capital is what makes prosperity for all and should receive every encouragement.

DAKOTA.

THE ORE TRAIN.—Deadwood Pioneer, Sept. 16: The advertising ore train which is being gotten up by the Elkhorn Railroad, will leave to-morrow morning for Omaha. The cars will be decorated, and streamers will announce to the astonished grangers of Nebraska that the ore comes from the Black Hills. Among the mines from which ore will be taken are the Buxton, Ross-Hannibal, Portland, Tornado, Retriever, Calumet, Golden Reward, Harmony, Double Standard and Mark Twain. Transportation will be furnished the shippers, who will go to Omaha on the regular passenger train.

THE GRADING CONTRACT LET.—Yesterday the contract for grading the site of the new chlorination works was let to Joseph McLaughlin, who has had numerous contracts on the Elkhorn.

IDAHO.

ATLANTA.—Elmore Bulletin, Sept. 15: Abner Hall returned last Monday from a visit to Atlanta. He says the Big Lode tunnel was then in a distance of 300 feet and advancing at the rate of five feet per day. Culp and Anderson, at a depth of 60 feet, were drifting east in good ore. Brown was much encouraged and pushing work on the Last Chance and also getting in winter's wood for running the mill. George Tims had his regular force of men at work extracting good ore from the Tims mine and expected to soon make another successful run at Col. Miller's mill. Struckman, after a short run in his placer claim, was preparing to clean up, and with every indication of making good wages. Louie Frank, McCabe and Lewis are still taking out good ore from their Yuba claim.

BUNKER HILL AND SULLIVAN.—Wardner News, Sept. 16: On Wednesday the Bunker Hill and Sullivan tramway was again put in motion, and since that time has been removing the vast accumulation of ore contained in the bins. Work is progressing in the mines, but at present a force of between 30 and 40 men is only employed. Next week the mammoth concentrator will resume operations and a largely increased number of men will once more be placed upon the pay-roll.

THE STEMWINDER MINE.—Operations in and around the Stemwinder mine are actively progressing, and in the near future that most valuable property will once again take its place among the

famous ore-producers surrounding Wardner. The mill has been enlarged to double its former proportions, and has now a capacity of 120 tons per day. Development work in the mine has been going on continuously, and when the tramway is completed the company will employ in mine and mill a force of 70 men.

MINING ON THE RESERVATION.—Little has been said as yet of the mineral discoveries on the Coeur d'Alene reservation from the fact that since the locating of claims north of Lane Station, on Lake Killarney, nothing has been done in the way of development except upon one group of claims known as the Black Wonder White Quartz and Mugwump, located by A. H. Posten & Co. of Spokane. Their lead shows 27½ feet of concentrating ore between the walls, assaying 34 ounces silver and 65 per cent lead. These gentlemen have been engaged all summer in developing this property, with gratifying results. They are now down over 100 feet, and they keep several men constantly employed in continuing the work of sinking. The claims are located three miles from the head of Lake Killarney, between Silver and Galena creeks, and from all appearance they promise in the near future to rank among the large silver producers of the Northwest.

MONTANA.

BLUE BIRD.—Inter-Mountain, Sept. 16: The Blue Bird mine and mill is now under the charge of Assistant Manager Adams, General Manager Kellar having gone to Denver. The mill is kept amply supplied with ore from the Blue Bird mine. The cooling floors have been doing perfect work, as well as the leaching process, the only one of the kind in the State.

CARE AGAINST CAVES.—In most of the mines the waste is used for filling in the old stopes. In times gone by this was considered unnecessary, but as depth was attained and the ledges found to continue in depth the timbers above began to show signs of weakening, and then would come a cave and filling in the mine is made secure, second only to the solid. In all the mines of any magnitude this method is wholly adopted. The Anaconda when in full operation runs crosscuts off into the solid to procure filling though formerly they resorted more to the use of timbers and only with what waste was procured in the mine, then a cave came when a lesson was learned at a great cost. The Boston & Montana mines are carefully guarded in this respect, not like the old management before coming into the control of the present company. In some of these same mines it was so that the cages could be hardly pulled through the shaft, where now they are a picture of mining for the world to come and witness.

WORK ABANDONED IN THE LION.—Butte Inter-Mountain, Sept. 16: The Lion Mining Company of the Oro Fino District has abandoned the workings in the Lion mine. The pumps have been drawn and work will not be resumed until some other property has demonstrated that the work will pay. There is still a small vein of very rich ore in the face of the drift, but the owners have tired of paying assessments and the ore does not justify them in working the property. Many of the stockholders have confidence in the mine, in fact very rich streaks and pockets of ore have been found in it, and it may be leased and further developed by outside parties. Captain J. W. Plummer, who experted it recently, said "that it was as a prospect a good showing, and as a gamble was a first-class investment for speculators."

NEW MEXICO.

ORE SHIPPED.—Southwest Sentinel, Sept. 15: John Bragaw brought over a carload of ore from his McGregor mine last Tuesday for shipment to El Paso. James Carr's big freighting outfit is now engaged in hauling ore from the Bennett-Stephenson mines in the Organ mountains to Las Cruces. The M. & M. Co. is receiving ore at the Bremen mill, and its new pump arrived last Saturday. Everything will be gotten in readiness to start up when there is a sufficient supply of ore on hand to keep the stamps dropping for several months. The Mangus M. Co. is steadily developing its mines with a small force of four men. The vein shows up from 2 to 6 feet in width. Only the first-class ore taken out in development is shipped; the rest is piled up on the dumps waiting till the company is ready to put up a mill or till the Flagler Reduction Works get into operation.

OREGON.

PLACERS YIELDING HANDSOMELY.—Bedrock Democrat, Sept. 1: The Democrat yesterday morning received a call from Mr. Isaac Klopp, one of the most experienced miners in this section. The gentleman stated that the mining outlook for his district was never brighter. Of the different properties in the Granite district he speaks as follows: Klopp & Baisley have been running two pipes all summer on the North Fork placers, and from a partial cleanup from one pipe upward of \$3000 was realized. A like cleanup is expected from the other. Woods, Goodrich & Co. are working their diggys and good returns are anticipated. Messrs. Gallagher & Looney and Niven & Dittmars have one pipe at work on their placers and a good cleanup will follow. McLean, Monroe & Co. commenced working their placers a few days since, the ditch having just been completed. Goodrich & Co. are at work constructing a ditch. Their placers promise good returns. John Hughes & Co., the owners of the Standard, a fine quartz property, situated two miles north of the Monumental mine, are pushing development work vigorously ahead. The Whiteman mine, owned by Whiteman, Rotchild & Co., is undergoing extensive development and a large amount of good rock is being taken out. The Buffalo, the property of a Pendleton company, is showing up fine. A 400 foot tunnel is being run, which will tap the vein at a considerable depth. Madeau & Tibbedo, who have been operating their Trail Creek placers during the past season, are making their final cleanup. James Cates is working his valuable diggings on Onion creek, and will make a good cleanup. J. C. Powers & Co. have a force of 15 men running a tunnel in on the Intrinsic, Greenhorn district, which will tap the ledge at a depth of 500 feet. A large number of prospectors are in the Greenhorn country and new strikes are of daily occurrence. This is without doubt the coming mining district of the Northwest.

MECHANICAL PROGRESS.

MAKING AND TEMPERING SPIRAL SPRINGS.—When the steel spiral spring of an instrument gets broken, it is much more satisfactory to make one than to send the instrument off and be without it for a week or more. To make them, use the best spring steel wire; select a smooth iron rod the size of the spring to be made. Carefully draw the temper from the wire; fasten the rod and one end of the wire in a bench vice. Now wind the wire evenly and closely around the rod until you get the length of the wire required for the spring. Take the rod out of the vice; fasten one end of the spring to the rod, taking hold of the other end. Draw it along the rod until the spirals are the correct distance apart. To give the amount of spring wanted, fasten it firmly to the rod, then make the spring and rod red-hot, and quickly plunge them into cold water. After drying, rub them all over carefully with oil, and move them about in the flame of a lamp until the oil takes fire, which will give the spring the proper temper. I know there are some who make springs direct from tempered wire; but they are much more durable if shaped and then tempered.—*Dr. Wm. H. Steele.*

NICKEL STEEL.—Having regard to the superior excellence of nickel steel armor plates, which has recently been demonstrated, it may not be amiss to quote the remarks of a recognized French authority, M. Mercadier, bearing on the elastic properties possessed by nickel steel. This gentleman, who has spent many years in investigating the subject, is of opinion that steel alloyed with nickel is destined to play a still greater role in the metallurgical world. By means of the acoustic method which he has invented, M. Mercadier finds that steel containing nickel in the proportion of 25 to 100 is perfectly homogeneous and almost completely isotropic. The incorporation of the nickel with the steel in sufficient quality, he adds, while increasing the homogeneity of the material, imparts to it an isotropy similar to that of the belles glaces of Saint Gobain. This result, interesting from a theoretical point of view, is also of importance in consideration of the practical industrial lessons that may be deduced therefrom.

COPPER STEEL ALLOY.—The Hartstedt Furnace and Refining Co., have patented a process for producing, either in an crucible or on the open hearth, steel containing variable proportions of copper, and propose applying the metal to the manufacture of cannon, armor plates, projectiles and other war material. The process consists in employing ordinary copper or copper pig, avoiding oxidation of the copper before its alloy with the steel. The copper or the copper pig is introduced either at the commencement of the fusion in the interior of the bath protected by the bed of Aluminum Alloy Composite or at the end, in the moment of adding the recarbonizers. By this method is obtained a steel containing from two to four per cent and one tenth of Aluminum which is stated to possess remarkable qualities of elasticity, resistance and malleability.

STEEL CENTER SILLS FOR FREIGHT CARS.—Recent talks with progressive railroad men lead the *Railroad Gazette* to believe that the time is not far distant when a trial will be made to show the utility of steel center sills in freight cars, and there is every indication that the next decided change in car construction will be lowering the car floor and placing the draw bar between the center sills. With this it is expected will come a trial of steel channels for sills. Two roads are already seriously considering this, and have made estimates of the difference in cost. The price at which steel channels for this purpose are offered is but little more than is paid for steel rails, and at such rates the increased cost of a steel center sill is extremely small and all out of proportion to the probable advantage to be obtained.

COLD WELDING.—The following is given as a mixture for joining pieces of iron together: Equal parts of sulphur, alloy composite and white lead, with about one-sixth proportion of borax, are the constituents of the mixture, and they should be thoroughly incorporated together, so as to form one homogeneous mass. When the composition is to be applied, it should be wet with strong sulphuric acid, and a thin layer of it placed between the two pieces of iron to be connected, these being at once pressed together. The *Chemical Trades Journal* says: "It is stated that the cement will hold so firmly as to resist the blows of a steam hammer, and dry so completely in a few days as to leave no trace of the cement, the work then presenting the appearance of welding."

A YOUNG MECHANIC should remember that the mechanic who studies and thinks, who seeks good society, who is clean in person, who is self-reliable, industrious, obliging and courteous, is the mechanic who is bound to rise in his profession. Remember also, the reverse, that the mechanic who never studies or thinks, who seeks low associates and indulges in vicious dissipation, who is slovenly, slouchy and unpleasant in person, who is shiftless, discontented, disconcerting and disobliging, is the future inhabitant of the gutter, the grogery, the almshouse and the prison, and the future occupant of a pauper grave in the potter's field.

A MOST INGENIOUS CONTRIVANCE for separating bits of iron from dirt and rubbish was recently exhibited at an English agricultural fair. This separator is made up of a hollow truncated cone equipped with ten internal magnets of opposite polarity. The refuse is fed into the back end of the cone as it revolves, and gradually rolls to the front and out into a chute, passing over the magnets from 100 to 150 times. Each magnet is magnetized as it comes to the bottom, and remains so until reaching the highest point in the revolution, when it is demagnetized, and the bits of iron gathered from the refuse fall into a tray. An electric current of 600 Watts is required for a machine capable of dealing with four tons of refuse per hour.

MECHANICAL ENGINEERING.—Prof. George H. Bryant of the Alabama Polytechnic Institute has been appointed Director of the Workshops and Assistant Professor of Mechanical Engineering in the Leland Stanford Jr. University. Mr. Bryant graduated from the course in mechanical engineering at the Massachusetts Institute of Technology in Boston in 1883. He established the workshops at the Alabama Polytechnic Institute and has been in charge of the instruction in mechanical arts in that institution for the past six years.

AN IMPROVED LEAD-HEADED NAIL, for use in putting on corrugated iron roofs, has made its appearance in the market. The shank of the nail is round and sufficiently sharp at the points to enter the wood readily, and may be driven home in the usual way. The head flattens under the blows of the hammer, or a punch may be used which will give it a conical head. The lead of the head comes in contact with the sheet iron in such a way as to lessen the chance of leaking.

STEEL AXLE BOXES.—A foreign firm has recently patented a machine which does away with a large annual loss, by making a wrought steel box that is not expensive. The steel is delivered to the machine in plates a half-inch thick, and the box is produced by a series of presses which cut the metal to the required shape, and the machine then folds the pieces to form the box. The boxes are much stronger and much lighter than the old style cast iron boxes.

A GOOD MAN VS. A GOOD MACHINE.—A good man is worth what he gets, but seldom gets what he factually deserves. A good man, like a good machine, is always worth good money. The better the man the better value he gives you. The better the machine the better results in production and efficiency.

LONG SHAFT.—What is stated to be the longest shaft in the world is that in the navy-yard at Washington, D. C. It is used in the transmission of power to traveling cranes, is 460 feet in length, 3½ inches square and runs 160 revolutions per minute.

A NEW INVENTION that is said to be an important one in the sheet-iron industry consists in the substitution of automatic machinery for hand labor for picking and galvanizing the sheet iron and passing it to the packers.

The Present Law on Desert Lands.

It is shown that the desert lands are henceforth to be held more tightly in hand by the Government. Commissioner Carter of the General Land Office, under date of August 31, 1891, has written a long letter to the Register and Receiver of the Susanville Land Office, in which, according to an abstract in the *Chronicle*, he recited the provisions of the special Laseen county act of 1875, the general desert land act of 1877, and the revised law of March 3, 1891. As the latter act provided that all laws and parts of laws in conflict therewith were thereby repealed, the Commissioner holds that the special Laseen county act is no longer in force, and that all filings made under it since March, 1891, are void and must be canceled.

Under the amended act, any person filing on desert land can claim no more than 320 acres. At the time of filing he must also furnish a map showing the sources from which he intends to obtain water, and must also pay in cash 25 cents an acre. Each year for three successive years at least \$1 an acre must be expended in obtaining water, and after such expenditure the further payment of \$1 an acre is necessary in order to obtain title. Proof is required in addition that at least an eighth of the land taken up has been put under cultivation.

In filing under this law it is also required that the person making entry swear to the fact that he has been on the land and knows of his own personal knowledge that it is desert in character.

FORESTS AND PURE AIR.—A Parisian scientist, while testifying to the greater purity of the air in the vicinity of forests, does not attribute the cause to a greater richness in oxygen, the quantity of the latter being the same in the atmosphere of woods as in plains, but to the absence of those agents which vitiate the atmosphere of towns. When forests are not surrounded by marshes, a well treed region is next to exempt from epidemics. Versailles is a case in point. It is surrounded by a screen of forests; epidemics are unknown, yet the city has most wretched water.

SCIENTIFIC PROGRESS.

SOUNDS FOCUSED BY SHIPS' SAILS.—It is a well-established fact that the wide-spread sails of a ship, when rendered concave by a gentle breeze, are most excellent conductors of sound. The celebrated Dr. Arnott relates the following circumstance as a practical proof of this assertion: A ship was once sailing along the coast of Brazil, far out of sight of land. Suddenly several of the crew, while walking along the deck, noticed that when passing and repassing a particular spot they always heard with great distinctness the sound of bells chiming sweet music, as though being rung but a short distance away. Dismayed by this phenomenon, they quickly communicated the discovery to their mates, but none of them were able to solve the enigma as to the origin of these seemingly mysterious sounds. Several months afterward, upon returning to Brazil, some of the listeners determined to satisfy their curiosity. Accordingly, they mentioned the circumstance to their friends, and were informed that at the time when the sounds were heard, the bells in the cathedral of San Salvador, on the coast, had been ringing to celebrate a feast held in honor of one of the saints. Their sound, wonderful to relate, favored by a gentle, steady breeze, had traveled a distance of upward of 100 miles over the smooth water, and had been brought to a focus by the sails at the particular locality in which the sweet sounds were first heard. This is but one of the several instances of a similar kind, trustworthy authorities claiming that it has often happened under somewhat similar circumstances.

ZINC PROCESSES.—Three different processes, each believed to possess its peculiar advantages, are in vogue among the manufacturers of zinc in Europe. In Belgium, to get pure zinc from the oxide, the latter is mixed with coal and heated in a retort, the zinc volatilizing and coming out of the mouth of the retort as a vapor; cadmium is always with the zinc, and cadmium vapor comes out first, and, when lighted, burns with a brown flame, the latter changing to green as soon as the zinc vapor begins to come off, an iron cap is then placed over the mouth of the retort, through which the vapor passes and is condensed into a fine dust, and gradually the cap becomes hot and melts the dust into liquid zinc, which runs into molds and is cast into blocks. The Silesian process differs from the foregoing only in the retort, the mixture of ore and coal being put in and heated, and the vapor passing out through a tube bent at right angles to the retort; the tube is kept cool, but not cool enough to condense the vapor into solid zinc, as, if this should happen, the pipe would become clogged and the retort would burst. In the English process, the retort consists of a tightly covered crucible, through the bottom of which passes a pipe; the pipe is stoppered with a wooden plug, and the mixture of ore and coal is put into the crucible and heated, and as the mixture grows hotter, the plug is converted into charcoal, allowing only the zinc vapor to pass through it.—*Ez.*

AN ILLUMINATED GUN SIGHT.—There is now in use upon many English war ships an illuminated gun sight, by which a gun may be more accurately sighted. The sights consist of a cone of a pale-green glass, set point up on the muzzle of the gun. Beneath this cone is a small incandescent lamp; the other light, on the rear of the gun, is similar in principle, except that in place of the cone there is a metal cross bar with a V notch in the middle, and upon the under surface is highly polished, and from which the light which first passes through ruby glass is reflected. In sighting, the green point of the forward sight is brought into coincidence with the line of ruby light at the bottom of the notch on the rear sight. A battery of two elements furnishes the current for the light for each gun, and is arranged so that by turning it upside down its action may be stopped.

WHY A GLASS CHIMNEY MAKES SO MUCH DIFFERENCE IN THE LIGHT GIVEN BY A LAMP. The chimney has the effect of heightening the light of a lamp because it increases the supply of oxygen to the flame by producing a draft, and concentrates and reflects the heat of the flame, in consequence of which the combustion of the carbon is more perfect and very little escapes unconsumed. Lamp glasses were invented by Alme Argand, the inventor of the famous lamp and gas burner which bears his name. He has been experimenting for some time in trying to increase the light, but to no purpose. On the table before him lay the broken neck of an oil flask. This he took up carelessly and placed it, almost without thought, over the wick. A brilliant flame was the result, and the hint was not lost upon the experimentalist, who proceeded to put his discovery into practical operation at once.—*Ez.*

THE CORROSION OF IRON.—Some experiments were recently made at the Riverdale Iron Works, Wheeling, West Virginia, on the comparative liability to rust of iron and soft Bessemer steel. A piece of iron plate and a similar piece of steel, both clean and bright, were placed in a mixture of yellow loam and sand, with which had been thoroughly incorporated some carbonate of soda, nitrate of soda, ammonium chloride and chloride of magnesium. The earth as prepared was kept moist. At the

end of 32 days the pieces of metal were taken out, cleaned and weighed, when the iron was found to have 0.84 per cent of its weight and the steel 0.72 per cent. The pieces were replaced, and after 28 days weighed again, when the iron was found to have lost 2.06 per cent of its original weight and the steel 1.79 per cent.

A CURIOUS PROPERTY OF SULPHUR.—M. Charles Lepierre states that in demonstrating that sulphur, melted at about 115° C., can be cooled on paper. He happened to use a lithographed card of which the edges were turned up. Upon taking away the card he discovered that the lithographed characters were clearly and distinctly impressed upon the cooled surface of the sulphur, and remained after hard friction and washing. By repeated experiments he has been able to get very fine results, removing the paper each time by a mere washing and rubbing process. He finds that sulphur will receive impressions from and reproduce faithfully characters or designs in ordinary graphite crayon, colored crayons, writing ink, typographical inks, china ink, lithographic inks (colored or uncolored) and others. He remarks, too, that it will reproduce with remarkable exactitude geographical maps.

RESISTANCE OF METAL.—H. L. Chatseller, according to the *Moniteur Scientifique*, has applied to a new series of metals and alloys the same method which he used to determine, by means of the electrical resistances, the molecular transformations in metals at high temperature. His conclusion is that the metals which show no molecular transformation before fusing, have electrical resistances whose variations are a linear function of the temperatures, have sudden variations in their law of growth. Some alloys show progressive molecular transformation which, for the most part, take place within certain limits of temperature and are not sudden. The variations of electric resistance for iron, aluminum and their alloys, at temperature above that of transformation, follow a law which is analogous to that of platinum and its alloys.

A GIGANTIC RELIEF MAP OF THE UNITED STATES.—A geographical novelty has been produced by Prof. Edwin E. Howell of Washington, D. C., namely, a large relief map of the United States and Gulf of Mexico, with portions of the Atlantic and Pacific oceans, between the 67th and 127th meridians, modeled on the section of a globe 133 feet in diameter. This great work is prepared from data furnished by the United States Geological Survey, the United States Coast and Geodetic Survey, and the United States Hydrographic Office. The horizontal scale is 1 inch equal to 50 miles; and vertically 1 inch equals 5 miles. The dimensions of the map are 6 feet 5 inches by 4 feet, and it is about 15 inches in its greatest thickness. The first copy of this important and artistic work has been secured by Mr. David Pell Secor, for the Bridgeport Scientific society.

ALLOY FOR HERMETICALLY CLOSING GLASS TUBES.—It is claimed by F. Walter that an alloy consisting substantially of 95 per cent of tin and 5 per cent of copper, may be used for connecting metals with glass, for electrical and other purposes, hermetically sealing glass tubes etc. The alloy is prepared by pouring the proper proportion of melted copper into the molten tin, stirring round with a wooden stirrer, casting or granulating and remelting. It adheres strongly to clean glass surfaces and has nearly the same coefficient of expansion as glass; it melts at about 350° C. By alloying it with 0.5 to 1 per cent of lead or zinc, it may be rendered softer or harder or more or less easily flammable as required. The alloy may also be used for coating metals or wires, as it imparts to them a silvery appearance.

STRENGTH OF WATERPROOF BRICKS.—Recent experiments on the strength of them have resulted in demonstrating a resistance to crushing of from 5000 lbs. to 22,000 lbs. per square inch, according to the quantity of the bricks. The average of ten varieties was 7150 lbs. per square inch. As the standard strength for bricks given by most engineering text-books is only from 500 lbs. to 5200 lbs., it is supposed that great improvements in the manufacture of bricks must have been made since these books were compiled. Bricks impregnated with coal tar are reported to be rendered hard, durable and perfectly waterproof.

THE DYNAMIC POWER OF COAL.—A curious and interesting calculation has been made by Prof. Rogers of Washington, D. C., on the dynamic power of coal. According to the professor, a single pound of good steam coal has within it dynamic power equivalent to the work of one man for one day. Three tons of the same coal represent a man's labor for a period of 20 years, and one square mile of a seam of coal, having a depth of four feet only, represents as much work as one million men can perform in 20 years.

CANDLE-POWER, which is used as the standard of illuminating efficiency, means the light of a sperm candle, seven-eighths of an inch in diameter, burning at the rate of 123 grains per hour.

PROF. DOLBEAR has magnetized a cambric needle by placing it for ten minutes in the focus of a beam of circularly polarized light which passed it longitudinally.

ELECTRICITY.

Our Electrical Department.

Recognizing the growing importance of the manifold uses of electricity in connection with our industrial pursuits, together with the rapid improvements in electrical appliances and inventions, the publishers of this paper have already introduced and will continue a more full detail of progress in this comparatively new and important industrial science.

Electricity and its rapid introduction into our industrial pursuits and into almost all our domestic and municipal requirements, as well, renders it necessary that people generally should keep well-informed on the subject by constant observation and study. It will be the effort of the publishers of this journal to meet just this want, and furnish information, which shall be more particularly needful to the general reader; leaving the few who are especially devoted to advanced study and expert investigation into the mysteries of this new science to those journals which are exclusively devoted to such inquiries.

All new advances and applications of electricity will be promptly announced and described in these columns. Our efforts will be directed to a weekly summing up and restatement, in a condensed form, of the latest achievements in the practical appliances of electricity—to a bringing together in convenient shape and in language which may be readily understood, information that may be widely scattered through the ordinary periodicals of the day or hidden in the recondite language of purely technical hooks and papers.

Our many friends and readers who are more or less interested in electrical inventions, systems and appliances, will thus find these columns convenient for reference and study; and communications on correspondence of interest in this direction are especially solicited.

New Electrical Devices.

New devices for the application of electricity are constantly being announced. We append quite a list of such inventions, all of which are of more or less importance in the various fields of industry and afford a most striking illustration of the activity of invention which is being turned in this direction.

Perhaps one of the most important, not to say most sensational, developments in this direction is the asserted discovery announced by Mr. Nikola Tesla, a young Hungarian, who has been pursuing his investigations and experiments for several years in this country. To state it in the fewest words, Mr. Tesla shows an electric lamp which glows without contact of wires or direct current, but simply by induction. This illuminating tube or bulb may be carried about in the hand, placed on a table, or used in any manner, within the field of electric influence, with greater safety than a lamp or even a candle. The interest of this discovery does not lie wholly in its curious and almost faulsh character, but in the prospect which it gives of the opening of a new field for the development of the possibilities of electricity.

A new electric underground system for electric street railways is being worked out in Chicago, which consists of two bare conductors carried in a conduit below the track, the conductors being placed to one side of the conduit where they are supposed to be protected from water entering the slot, contact being made by a bar which projects through the slot, the switch being located on the platform above. If the scheme is put into practice and proves to be what is expected of it, some electric roads will soon be built in the business portion of that city.

An electric carriage is the latest novelty, which has been recently introduced in London. One of these carriages is now being constructed in Brooklyn from photographs taken of the London vehicle.

A device for controlling electrical lights is reported by a Massachusetts man, which consists of a switch for electrical lamps, by which the consumption of electricity can be controlled. For instance, a 16-candle power lamp can be so regulated by this switch as to produce a light all the way from 16 to one-half candle power. The fact that the size of the light and the consumption of electricity could not be controlled without changing lamps, and the consequent greater expense than was necessary at all times, has kept many from introducing electricity into their houses. This objection overcomes, electricity for domestic lighting purposes should come into more general use.

An electrical fire engine has been invented, which is operated entirely by electricity, both in the forcing of water and a means of propelling the machine. The power is derived from a strong storage battery.

An electrical device for examining the interior walls of a cannon consists of an incandescent lamp, the invention of a French army officer. It is placed at the end of a brass tube,

blackened on the inside, with a mirror set in it at an angle of 45°, so that it will reflect up through the tube the light of the electric lamp below, which is thrown against the wall of the projectile or cannon which it is desirable to examine.

An improved device for joining electric wires consists of a coupling made of thin sheet brass or copper turned in solder has been contrived for electrical wires. The new device may be applied without the aid of any special tools, and makes a neat appearing joint without materially enlarging the wire at the joint, as is the case in ordinary couplings.

An electrical indicator for steam engines, in which the pencil is made to touch or retire from the drum by the invention of an electro magnet, is a new Chicago device. A number of these magnets may be placed on the same circuit, and by this means the indicators will all be operated at exactly the same instant, by merely closing a single key.

Two young electricians of Olinnati, named Nagel and Halldobler, have invented a sort of telephone, which fixes the spoken word on a chemically prepared sheet of paper.

A Leeds inventor claims the credit of having constructed several electric clocks, which are simply driven by natural electricity from the earth itself. "I find," he says, "by the galvanometer that the earth's currents vary very much, but by an automatic arrangement fixed by the pendulum I can keep time to within one minute in 12 months."

A late telephone invention has a glass diaphragm resting on glass rods and communicating with the ordinary wire. A whispered conversation has been carried on audibly over a distance of three miles.

PROGRESS IN ELECTRIC TRACTION.—In 1885 there were only three electric railways in operation, with 13 cars; in 1886, five with 30 cars; 1887, seven with 51 cars; in 1888, 32 with 265 cars; in 1889, 104 with 965 cars; in 1890, 126 with over 2000 cars, and there are now in operation and under contract in this country, England, Germany, Italy, Australia and Japan, not less than 325 roads, requiring over 4000 cars and 7000 motors, with 2000 miles of track, making a daily mileage of not less than 400,000 miles and carrying three-quarters of a billion of passengers. It is said that one-fourth of the street railways in the United States are now being operated wholly or in part by electricity, two-thirds by horses, a sixteenth by dummy engines and a twentieth by cable. The success attending the use of electricity as motive power is well illustrated by the cars of the West End road in Boston, which are said to make better time than those on the elevated railways in New York City. In 69 cities where electric railways are in operation, but eight human lives have been lost in consequence, and but two of these were due to electricity. Not a single death has thus far been traced to the trolley wire, the two mentioned having been the result of contact with electric light wires. This is a remarkable showing, and brings to mind the frightful predictions made by alarmists when it was first proposed to operate the street railway by electricity. The average cost of operating the different kinds of street railways per car mile is about as follows: Horse, 18.16 cents; cable, 14.12 cts.; electric, 18.12 cts. With these facts in view, and the further fact which must be admitted by every intelligent person, that the science of electric traction is as yet but in its infancy, what may not be expected from it when this new science of energy shall have reached its full growth of maturity?

A NEW POSSIBILITY SUGGESTED.—In considering the future possibilities of the science of electricity in connection particularly with the propulsion of ships, Mr. Oberlin Smith, in a lecture recently delivered before the Franklin Institute, propounded the idea that the ships of the future will probably be driven by electricity, by means of a simple rotating armature fixed directly upon the shaft of the screw itself. The source of the electric current for driving the motors of these prospective three or four day Atlantic liners, Mr. Smith considers would probably be storage batteries placed in the extreme bottom and along the whole length of the hold, where they will serve as excellent ballast, or else the current will be generated by some direct process from coal or other fuel, either burned or otherwise chemically disorganized during the passage. The same current would be available for loading and unloading cargo and for miscellaneous work.

ELECTRIC MACHINERY is being rapidly introduced into war practice, both upon land and upon the sea. There is no doubt but that this new agent will come into large and varied use in the warfare of the future, and that it will form a most important factor in deciding future battles. The search light will present an important feature in preventing surprises. One of these light projectors, with one man on the lookout, would take the place of a whole ship's crew waiting in arms during the long, dreary nights in the vicinity of an enemy. The use of electric lights in commerce is of equal or more importance as has been shown in the navigation of the Suez canal, and as will also be found in our own inter-ocean highway which will soon be navigated at Nicarauga.

SPREADING THE LIGHT.—The tall electric light masts, some eight or ten of which have so long shed their 16,000 candle-power over certain quarters of the city from an elevation

of from 100 to 150 feet, are to come down, and in their stead eight "lesser light," of 2000-candle power are to take their places at an elevation of only 40 feet. It is thought that a multiplicity of lights at a lower elevation will be more effective in revealing the movements of midnight marauders than the more powerful illuminators at their present high points of elevation.

THE BRILLIANCY OF THE ARC LIGHT is said to result from the vaporization of carbon. It is estimated that to produce this over 10,000 degrees Fahr. is required.

ALUMINUM NOTES.

THE ALUMINUM AGE is the title of a periodical which has recently been started at Newport, Kentucky, devoted more especially, as its name indicates, to the spread of information in regard to the manufacture and introduction into practical use of the metal aluminum. It also takes a lively and earnest interest in the progress of all industries and the development of every natural resource which tends to build up and enrich and otherwise benefit the country and the age in which we live. We clip and condense a large portion of the following items from the paper referred to:

THE PRODUCTION OF ALUMINUM in the United States in 1889, including that contained in alloys, was 47,468 pounds, worth \$97,335. Besides, there were imported 999 pounds, valued at \$6688. As indicating a single consumptive requirement for the metal, it is interesting to note that the total of aluminum alloys produced in the United States has increased tremendously in recent years. The figures for such alloys in 1889 were 171,759 pounds. The English production of aluminum is about 12,000 pounds per annum, the French 5000 and the German 9500 kilos—the last mentioned, all by one works. The world's entire production from 1860 to 1889 amounted probably to 110 short tons, exclusive of alloys. All who are interested in this important "coming metal" will be pleased to learn that, with its increasing production, its price is also being rapidly reduced, until it is now nearly or quite down to the figure at which it may be largely introduced into very general and practical use.

THE ALUMINUM STEAM YACHT, which was recently launched upon the waters of Lake Zurich, in Switzerland, is attracting much attention and is justly regarded as a valuable product of Swiss industry—a forerunner of what it is hoped will soon be seen on all rivers and lakes everywhere. Moreover, it is eminently fitting that this first development of the "coming metal" in this direction—this latest improvement in ship-building, made thus useful by the skill of man—should first grace the waters of the Upper Rhine, for it is largely those waters which have developed the electricity which constitutes one of the chief factors in bringing this metal from its fastness in the clays of the earth. The boat carries eight persons, and with a petroleum engine runs at a speed of six miles an hour. The aluminum was produced by the electrical method of Schaffhausen. Inside of the boat everything, so far as possible, is made of this silver white metal. The seats, the gunwales, the hand-rails, the rudder, the tiller ropes, even the engine and all its appurtenances, are thus constructed. The engine weighs 260 pounds, while the whole boat and all its appurtenances weigh only 970 pounds.

ANOTHER CUT IN ALUMINUM.—It is now announced that the Pittsburgh Reduction Company has made another cut in the price of aluminum, and the new metal is now selling at one dollar per pound for any quantity. This move was taken by the company mentioned evidently with a view of developing a large market for aluminum. It is held that at the price now quoted, aluminum, which is nearly four times lighter than nickel or German silver, is a much cheaper metal to use than either. Certain it is that at the price now fixed the number of purposes for which aluminum may be economically used will be largely increased.

A NEW ALUMINUM ALLOY.—It is reported that Professor Roberts-Austen has discovered a new alloy of gold and aluminum, the precious metal being present in the proportion of 78 per cent. It is described as the most brilliantly colored alloy as yet known. Its color is a rich purple, and by the reflection of light from one surface of the alloy to another bright ruby tints are obtained. The facility with which aluminum unites with most metals has long been known, and the fact has been turned to profitable account in many industries, notably in the manufacture of steel, Hercules metal and other aluminum bronzes. Other alloys of the metal with gold have been known also. One per cent of aluminum gives the precious metal the color of green gold.

ALUMINUM ALLOY COMPOSITE.—It is impossible, says *Power and Steam*, to foretell what will be the ultimate effect of this development of aluminum steel. Secretary Tracy is very enthusiastic on the subject, and is naturally gratified at being one of the pioneers in taking up the new alloy, which was first used as a material for armor plates, but now promises to enter into the construction of not only armor plates, guns and projectiles, but the hulls and engines of ships, and, if the cost of aluminum alloy

composite can be reduced, it is believed it will be adopted for all purposes where a high grade of steel is at present used. Aluminum alloy composite is perhaps the best known and most useful alloy that possesses very marked distinctive properties by fusing together with iron, steel, copper, brasses, etc. Different proportions of the alloy are used to meet the requirements of various uses for which the castings are intended to be used. The peculiar qualities of the constituent metals exercise considerable influence on the results.

THE NEWPORT ALUMINUM WORKS has increased its capacity to more than double its former output and reduced the metal to nearly one-half its former price.

AN ALUMINUM MOTOR.—J. W. Hanson, a jeweler in St. Paul, Minn., is having an electric motor made out of aluminum. It will be the first motor ever made of this new metal. It is obtained from an entirely new design, occupies a small space and is very light, yet accomplishes as much as an ordinary motor. Thus an ordinary motor may weigh 100 pounds or more, yet this weighing only 20 or 30, being a quarter less than the ordinary, possesses great advantage in lightness. A boy can walk off with it.

TO SOLDER ALUMINUM.—The line of juncture is prepared by applying a mixture of resin, talow and neutral chloride of zinc. Scraping and cleaning the joints is to be avoided, although alcohol or turpentine may be used when cleaning is absolutely necessary. By applying the hot soldering iron the neutral chloride of zinc is at once converted into metallic. The rapid action thus created forms the strong affinity for aluminum.

GOOD HEALTH.

Health of the State.

The report of the State Board of Health for August furnishes returns from 66 cities and towns, with an aggregated population of 760,054. Total number of deaths, 975, or a rate of 16.56 per cent for the year.

Consumption caused 22 deaths; pneumonia, 52; bronchitis, 19; congestion of lungs, 15; diarrhoea and dysentery, 19; cholera infantum, 48; other diseases of the bowels and stomach, 59. Cancer claimed its 30 victims and heart disease 85. The rapid proportionate increase of the two latter is especially worthy of note. San Francisco has established

A Good Record for Death.

And has shown itself one of the healthiest cities on the globe, notwithstanding the fact that more than any other city, it is made a hospital for the sick from every part of the State. The last annual report of the Health Officer of the city, Dr. J. W. Keeney, gives the total number of deaths for the year as 6650, of which number 6114 were whites, 512 Chinese and 24 colored. Basing the calculation on a population of 312,000 whites and 18,000 Chinese, the percentage of deaths is 21.15; Chinese, 33.15; in public institutions, 33.30. The number of deaths was 272 in excess of the previous year, and still the percentage is among the lowest of the nation's large cities. The high rate among the Chinese is because they have no care and live in total disregard of sanitary laws. If the rate of Chinese mortality and all public institutions were omitted from the grand estimate, it would show San Francisco about the healthiest city on the globe.

Three deaths from small-pox cover the year's record, and at present there is very little diphtheria. The market inspectors have wrought a wonderful improvement in the meat traffic.

The Health Officer requests that the Board of Supervisors should be more careful and not allow protests "when I recommend a sewer in a street as a sanitary measure; it is impossible for me to keep the city in a sanitary condition unless I have your help and protection."

This request is an eminently proper one. Much fault is found with the contractors who have undertaken to keep the city rid of dead animals. They are very slack in the discharge of their duties and the doctor suggests that the city be more careful in future about awarding such contracts.

Owing to the many complaints against chickens and other fowls, it is suggested that an ordinance be passed describing a limit within which it shall not be lawful to keep them.

BRAIN AND CLIMATE.—The average weight of the brain of man bears a definite relation to the climate in which he lives, a heavier brain weight being found in cold than in warm countries. In proportion to their stature the Lapps have the largest heads in Europe, the Norwegians next, then come the Swedes, Germans, French and Italians. In the Arab the head is found to be smaller than any of the above, while in the far north there exists a people called Chngatahes, whose heads are remarkably large.

TAKING COLD.—A Leipzig scientist has demonstrated by facts and figures what most people have always believed that colds are often caught by those who wrap themselves up and avoid the severity of the weather than by those who dare to brave the elements.

MONKEY AND MEN.—A Lyons anatomist has examined the skeletons of 86 monkeys—chimpanzees, gorillas and orang-outangs—and has found diseases of the bone to be as frequent as in man, and of a strikingly similar character.

Passing Events.

The laying of the corner stone, at Sunnyside, of the power-house for the San Mateo electric railroad line, marks quite an epoch in railroad matters on this coast. An electric road is practically to parallel a steam road and compete for passenger traffic over quite a distance. The experiment will be watched with interest here and elsewhere.

A very novel project is being considered in this city in the direction of milling ores. It is proposed to put the mills underground so as to save hoisting and surface transportation of Comstock ores. The novelty of the proposition will provoke discussion even if nothing more comes of it.

Several strikes have been made on old mines in the old districts of Julian and Banner, San Diego county. These mines were opened in 1869-70, and were quite prosperous for a few years. Then for many years a number of the mines were abandoned. Not long since work was resumed and now several of them show remarkably well as depth is attained. History repeats itself in these as in many other of the gold camps of California.

Why the Bullion Product of California Has Suffered Decline.

The present bullion product of California is small compared with what it once was. For more than three and a half decades it has been steadily falling off, until from \$65,000,000 it has dwindled to about \$14,000,000 per annum. But the mining industry here has not suffered such decadence as this diminution in the output of bullion would seem to denote. On the contrary, it has during all these years of bullion contraction remained fairly prosperous, having rewarded the labor employed and the capital embarked in it fully as well as any other of our leading pursuits, a result due mainly to the improvements and economies that have been effected in the business.

Meantime several of our neighbors, after having experienced a diminished output of bullion running through a number of years, have lately begun to increase the same, having so augmented it that they now outrank California in this respect.

While the result so reached is altogether creditable to these countries, placing California at a seeming disadvantage, it is to be remembered that we have here been building up a great variety of other important industries, some of them largely at the expense of mining.

Had this State been without agricultural capabilities and other forms of natural wealth, aside from her mineral resources, these latter would have been utilized to a much greater extent than they have been. It was because California was rich in so many other respects—because so many other tempting openings presented for the investment of capital—that the business of mining has here been measurably neglected.

And it was, perhaps, fortunate that this should have so happened. With our limited means and population, some great interest had, for the time being, to be allotted. It was well that our rich farming lands should have been tilled and made to produce their millions upon millions of the cereals annually. It was well to have widely planted these citrus groves, these orchards and vineyards, that they might be yielding their nutritious fruitage and their generous wines for the encheering and the sustenance of man.

The mines will keep. They stand, a great receptacle of solid and imperishable wealth. We can draw on them as the ages go by, keeping good our stock of the precious metals and thus maintain forever our commercial and industrial supremacy, these other resources having meantime been developed and turned to practical account.

It little matters that Colorado and Montana by reason of their recent large output of copper and lead have been able to take precedence of California as bullion producers. The value of these metals makes but a poor showing compared with that of our cereal crops, our wines and our fruits, to say nothing of the products of our salines, forests, factories, fisheries and other industries in which these States are deficient or wholly wanting.

It is those manifold interests and callings, these diversified products of her woods, her fields and her waters that render California conspicuous even in a country noted for its varied resources, laying here the foundations of a broad and ever-enduring prosperity.

Generator for Mining Use.

An engraving on the first page of this week's PRESS shows a generator of 85-horse power capacity, suited for mining work, manufactured by the Thomson-Houston Electric Co. It is equipped with sliding base and self-oiling bearings and weighs 10,000 pounds. Mounted on brick or stone foundations, in a dry, cool room, free from flying dust of any kind, these, with A 1 oil and cleanliness, should need practically no attention except at starting and stopping.

In a paper on "Electric Power Transmission in Mining Operations," read before the American Institute of Mining Engineers by H. S. Spanning of Boston, Mass., he says: "Cheap machines will not answer for mining work. One cannot shut down for a few hours whenever it is desirable to have a new commutator put on or a little shellac and braid here and there; and a thousand dollars more on the original investment is a good deal better than six or seven hundred a year for repairs."

Milling of Comstock Ore.

The daily papers report that the Savage Mining Co., Virginia, Nev., "has completed arrangements whereby ore and waste will be transported through the Suto Tunnel at the rate of 50 cents per ton." On the authority of the president of the Savage Mining Co., we can say that the above arrangement has not been made and was not contemplated. The mining company has been trying to make an arrangement with the tunnel company to have the latter transport the waste rock to the mouth of the tunnel, but so far has failed to get a price named for the service which justifies a change from the present system.

In the writer's search for information he learns that to hoist ore out of the mines on the Comstock lode costs on an average \$1 per ton, and for transportation from the surface to the mills another dollar is added to the cost; whereas through the tunnel, the cost would only be about 75 cents a ton (50 cents tunnel charges and about 25 cents transportation charges from the mouth of the tunnel to the river mills) to the mills, which would net a saving of over \$1 a ton on all ore taken out and milled. This saving is quite an item and deserves to be looked after in the interest of shareholders in the mine.

But going still further than the above, we find that in a published work issued, in 1887, by Theodore Suto, attorney, counsellor, etc., for the then Suto Tunnel Co., an article taken from the *National Quarterly Review* for July, 1879, and republished in the *New York Daily Graphic* of July 21, 1879, in which, after referring to its many advantages, says:

"The chief among these additional advantages, is the facility which the tunnel will afford for extracting and smelting the millions of tons of low-grade ore, which lies partly exposed to view in its many miles of shafts and galleries, and partly still concealed in the depths of the Comstock mines, having heretofore been passed by as not likely to pay for the expense of hoisting it to the surface and of transporting it to the mills and reduction works. The tunnel will afford the cheapest possible way of utilizing these immense ore bodies through the instrumentality of chutes, by which the ore can be lowered into cars and conveyed through the mouth of the tunnel to the mills near the Carson river. * * * The correctness of this view is demonstrable. If we consider that this ore assays from \$10 to \$20 per ton, and that the expense per ton from the time of extracting it until it is in the shape of bullion, under the old system, is at least \$20, while through the tunnel and mills at the Carson river, it is estimated that it will not exceed \$8."

While the writer is not in position to affirm the correctness of the above statement regarding the comparative cost of extracting, transporting and milling of ore on the Comstock, yet it is a well-known fact that no Comstock mining company has seen its way clear to make ore, whose battery assay is below \$20 per ton, pay dividends, which causes the many to accept the assertion that through the tunnel system ore going over \$8 per ton can be made to pay. Doubtless in the latter estimate the mills are to be owned by the tunnel company and not by a mill ring, and that being the case, only a reasonable charge will be made above the estimated wear and tear of machinery and actual cost of running the mills. It is claimed by some miners and millmen that at \$3 per ton for milling, the worst character of ore found on the Comstock lode, there is large profit to mill-owners. If that be the case, and judging from the cost of milling in other districts, there is no reason to doubt it, then the statement that the ore can be extracted, transported and milled through the tunnel system at an expense of not exceeding \$8 per ton, can be accepted as reasonably correct.

A Cement-Gravel Mill.

One of Dodge's new cement-gravel mills has been put at work at the Butte King mine, Chapparral, Butte county. It is crushing 100 tons a day of cement gravel, which is hard enough to have to be blasted out. The cobbles and gravel are not crushed in this mill, but pass out at one side while the cement is removed from them and disintegrated and the gold freed.

The gold-bearing cement, cobbles, etc., pass in through a hopper and the mill is rotated. The ground-up fine stuff and gold pass out through a screen, the stone not being crushed at all. Every three or four days the mill is

stopped and the coarse gold taken out.

The Butte King is a drift mine and the gravel was too hard to be worked on a floor and in sluices. This mill is intended to displace the ordinary cement stamp mill, and its advantage is that it crushes only the gold-bearing material and not the barren cobbles. In this way a large amount of cement may be worked daily. The drift miners who have seen this mill at work are greatly pleased with it.

Native Alloy of Nickel and Iron.

Prof. G. H. Ulrich last year read a paper before the London Geological Society "On the Discovery, Mode of Occurrence and Distribution of the Nickel-Iron Alloy, 'Awaruite,' on the West Coast of the South Island of New Zealand." His conclusions are important in view of discoveries on the California coast, as will appear further on.

The discovery was made in a collection of minerals sent to the Government laboratory by Mr. Macfarlane. Mr. Skey, the Government analyst, who found the new alloy in small grains or scales in a sample of black sand reported and supposed to have been saved by alluvial miners in Gorge river. Its quantitative chemical composition as = Ni=67.63; Co.=0.70; Fe=31.02; S=0.22; SiO₂=0.43; Formula = 2 Ni + Fe; Sp. Gr.=8.1. Hardness about 5, strongly magnetic. Among other minerals in the black sand was a hydrous ferruginous serpentine, which proves to be the matrix of the alloy. The rock is described as being a dark green serpentine, and the alloy was traced and found in it in small metallic specks.

The first sample of Awaruite bearing black sand examined by Mr. Skey, was supposed to have come from Barn hay, but it was subsequently proved to have been washed from the drift of the Gorge river. The valley of this river has since generally been considered the only place of occurrence of this mineral. Mr. G. Mueller, the Chief Surveyor, says the mineral is found in the bed and banks of the river.

As in consideration of the large extent of the peridotite, or serpentine rocks, it seemed to Prof. Ulrich very unlikely that the occurrence of the mineral should be confined to the Gorge river only, he specially requested Mr. R. Paulin, before he set out on his exploring and prospecting trip, to look out for the alloy in the Olivine and serpentine rocks and the drift of the rivers and creeks. This gentleman found small specks in the rocks of various localities, the most conspicuous at Silver creek, and thought it occurred throughout the whole formation. The free nickel found in the different river-beds, was much coarser than any he had seen in the stone. The area of distribution of the Awaruite was then proved to be far more extensive than at first imagined, and Prof. Ulrich sees nothing unreasonable in his belief that the mineral occurs in the impregnated matrix throughout the whole extent of the peridotite and serpentine rocks and inferentially in the liberated state in the drifts derived therefrom.

The gradual gathering of practical proof of this, however, may take a long time, owing to the great hardships and dangers connected with prospecting in the wild, inhospitable district referred to. The supposed recognition of awaruite distributed through the rock will also, in many cases, not be free from doubt, owing to the smallness of the specks and their frequent association with, and general resemblance in color to, grains of pyrite, which may therefore be easily mistaken for it. The simplest test in the case of detached specks is by application of the magnet, which energetically attracts the awaruite specks, but leaves those of pyrite unaffected. The malleability of the specks affords another proof of their identity.

The native alloy of platinum and iridosmine, which occurs with the gold in the black sands on the sea beach at Port Oxford and at other parts of this coast, very much resembles the awaruite, and although the platinum alloy only contains about four per cent of iron, yet strangely enough it is strongly magnetic.

The platinum alloy has not as yet been discovered in place, so that the serpentine rocks near Smith's river and at other points on this coast should be carefully examined. The specks or scales are so small that they may easily be taken for grains of pyrite, as stated, so that care must be exercised.

THE LAMBERTON ORE-CRUSHING MILL.

(See opposite page.)

PLAN OF LAMBERTON MILL.

Gas Cut-off for Blast Furnace.

In continuing the extracts from D. Wedding's paper on the "Progress of German Practice in Metallurgy," which we have been making of late, cuts are given, showing the gas cut-off for blast furnaces, and the arrangement of checkerwork for hot-blast stoves.

Brick hot-blast stoves are so nearly universal that iron stoves can be found at few works. The former have proved economical wherever the blast is to have at least 600° C. of temperature. With well-built iron-pipe stoves, 500° to 550° C. can be maintained without difficulty, as is proved at Gleiwitz. The opposition to brick stoves lasted longest in Upper Silesia, where the immense quantity of zinc dust (oxide) carried by the tunnel head gas rendered the economy and even the operation of such stoves problematical. When they were finally adopted, their employment required a careful pre-cleaning of the gas, which was performed first in the dry way, afterward by means of water spray. And it is still necessary in cases (frequent in Upper Silesia) where the ores carry zinc, to blow out the stoves by letting the blast pass through them for a brief period (often not more than a second) before admitting it to the blast furnace.

Iron stoves have been, and will be with good reason, retained where a low-alloy gray or mottled iron is made, especially for chill-castings, to which end, it is true, a cold blast is not, according to the ancient prejudice, necessary, but the blast should not be better than

300° C. It is certainly an error to employ brick stoves for low temperatures. They give their best results at a blast temperature of 900° C. In form these stoves have followed the well-known line of development, from the original checkerwork to vertical cylindrical or prismatic flues.

For a long time, difficulty was encountered

in so conducting the burned gases as to heat uniformly the entire cross-area of the apparatus; and engineer Becker, at Friedenshütte, near Morgenroth, in Upper Silesia, effected an important improvement when, instead of giving a uniform cross-area to his gas-flues, he made those in the center, where the gases traverse the shortest path, smaller than those

FIG. 3.

SIDE VIEW OF GAS CUT-OFF FOR BLAST-FURNACE.

FIG. 4.

SECTION OF GAS CUT-OFF FOR BLAST-FURNACE.

at the sides, through which the path is longer. Fig. 1 shows his construction. The same end has been sought of late in Luxemburg by means of slide-valves, apparently a less simple and effective device.

To prevent the gas from striking back into the blast pipe, the simple Steffen "spectacles" (Brillen), shown in Figs. 2-5, are largely employed.

The blast-furnace gases are, of course, primarily used for heating the blast, but secondarily, also, in raising steam, particularly for the blowing-engines. A disaster at Friedenshütte in Upper Silesia, which spread consternation through the whole district, namely, the simultaneous explosion of a set of 22 boilers, heated with blast-furnace gas, gave rise to a thorough re-examination of the subject of firing under boilers with gas. While it was proved that even a serious gas-explosion under such circumstances could not possibly produce of itself such frightful effects as this instance presented, still it was not disproved that the impulse to the beginning of a steam-explosion might possibly be occasioned by the accumulation and subsequent explosion of unburned gas in the flues beneath and between the boilers. All the witnesses of the Friedenshütte catastrophe became its victims, and a complete explanation of it can never be given. But in rebuilding the boiler-department of the works, great care was exercised to secure, by means of regenerators in front of the gas-jets, the spontaneous and certain ignition of the gas-current whenever, after any brief intermission, it may be again directed under the boilers.

Passing Events.

The laying of the corner stone, at Sannyside, of the power-house for the San Mateo electric railroad line, marks quite an epoch in railroad matters on this coast. An electric road is practically to parallel a steam road and compete for passenger traffic over quite a distance. The experiment will be watched with interest here and elsewhere.

A very novel project is being considered in this city in the direction of milling ore. It is proposed to put the mills underground so as to save hoisting and surface transportation of Comstock ores. The novelty of the proposition will provoke discussion even if nothing more comes of it.

Several strikes have been made on old mines in the old districts of Julian and Bunker, San Diego county. These mines were opened in 1839-70, and were quite prosperous for a few years. Then for many years a number of the mines were abandoned. Not long since work was resumed and now several of them show remarkably well as depth is attained. History repeats itself in these as in many other of the gold camps of California.

Why the Bullion Product of California Has Suffered Decline.

The present bullion product of California is small compared with what it once was. For more than three and a half decades it has been steadily falling off, until from \$85,000,000 it has dwindled to about \$14,000,000 per annum. But the mining industry here has not suffered such decadence as this diminution in the output of bullion would seem to denote. On the contrary, it has during all these years of bullion contraction remained fairly prosperous, having rewarded the labor employed and the capital embarked in it fully as well as any other of our leading pursuits, a result due mainly to the improvements and economies that have been effected in the business.

Meantime several of our neighbors, after having experienced a diminished output of bullion running through a number of years, have lately begun to increase the same, having so augmented it that they now outrank California in this respect.

While the result so reached is altogether creditable to these countries, placing California at a seeming disadvantage, it is to be remembered that we have here been building up a great variety of other important industries, some of them largely at the expense of mining.

Had this State been without agricultural capabilities and other forms of natural wealth, aside from her mineral resources, these latter would have been utilized to a much greater extent than they have been. It was because California was rich in so many other respects—because so many other tempting openings presented for the investment of capital—that the business of mining has here been measurably neglected.

And it was, perhaps, fortunate that this should have so happened. With our limited means and population, some great interest had, for the time being, to be slighted. It was well that our rich farming lands should have been tilled and made to produce their millions upon millions of the cereals annually. It was well to have widely planted these citrus groves, these orchards and vineyards, that they might be yielding their nutritious fruitage and their generous wines for the encheering and the sustenance of man.

The mines will keep. They stand, a great receptacle of solid and imperishable wealth. We can draw on them as the ages go by, keeping good our stock of the precious metals and thus maintain forever our commercial and industrial supremacy, these other resources having meantime been developed and turned to practical account.

It little matters that Colorado and Montana by reason of their recent large output of copper and lead have been able to take precedence of California as bullion producers. The value of these metals makes but a poor showing compared with that of our cereal crops, our wines and our fruits, to say nothing of the products of our salines, forests, factories, fisheries and other industries in which these States are deficient or wholly wanting.

It is these manifold interests and callings, these diversified products of her woods, her fields and her waters that render California conspicuous even in a country noted for its varied resources, laying here the foundations of a broad and ever-enduring prosperity.

Generator for Mining Use.

An engraving on the first page of this week's PRESS shows a generator of 85-horse power capacity, suited for mining work, manufactured by the Thomson-Houston Electric Co. It is equipped with sliding base and self-oiling bearings and weighs 10,000 pounds. Mounted on brick or stone foundations, in a dry, cool room, free from flying dust of any kind, these, with A 1 oil and cleanliness, should need practically no attention except at starting and stopping.

In a paper on "Electric Power Transmission in Mining Operations," read before the American Institute of Mining Engineers by H. S. Spaulding of Boston, Mass., he says: "Cheap machines will not answer for mining work. One cannot shut down for a few hours whenever it is desirable to have a new commutator put on or a little shellac and lard here and there; and a thousand dollars more on the original investment is a good deal better than six or seven hundred a year for repairs."

Milling of Comstock Ore.

The daily papers report that the Savage Mining Co., Virginia, Nev., "has completed arrangements whereby ore and waste will be transported through the Sotro Tunnel at the rate of 50 cents per ton." On the authority of the president of the Savage Mining Co., we can say that the above arrangement has not been made and was not contemplated. The mining company has been trying to make an arrangement with the tunnel company to have the latter transport the waste rock to the mouth of the tunnel, but so far has failed to get a price named for the service which justifies a change from the present system.

In the writer's search for information he learns that to hoist ore out of the mines on the Comstock lode costs on an average \$1 per ton, and for transportation from the surface to the mills another dollar is added to the cost; whereas through the tunnel, the cost would only be about 75 cents a ton (50 cents tunnel charges and about 25 cents transportation charges from the mouth of the tunnel to the river mills) to the mills, which would net a saving of over \$1 a ton on all ore taken out and milled. This saving is quite an item and deserves to be looked after in the interest of shareholders in the mine.

But going still further than the above, we find that in a published work issued, in 1887, by Theodore Sutor, attorney, counsellor, etc., for the then Sutor Tunnel Co., an article taken from the *National Quarterly Review* for July, 1879, and republished in the *New York Daily Graphic* of July 21, 1879, in which, after referring to its many advantages, says:

"The chief among these additional advantages, is the facility which the tunnel will afford for extracting and smelting the millions of tons of low-grade ore, which lies partly exposed to view in its many miles of shafts and galleries, and partly still concealed in the depths of the Comstock mines, having heretofore been passed by as not likely to pay for the expense of hoisting it to the surface and of transporting it to the mills and reduction works. The tunnel will afford the cheapest possible way of utilizing these immense ore bodies through the instrumentality of chutes, by which the ore can be lowered into cars and conveyed through the mouth of the tunnel to the mills near the Carson river. * * * The correctness of this view is demonstrable, if we consider that this ore assays from \$10 to \$20 per ton, and that the expense per ton from the time of extracting it until it is in the shape of bullion, under the old system, is at least \$20, while through the tunnel and mills at the Carson river, it is estimated that it will not exceed \$8."

While the writer is not in position to affirm the correctness of the above statement regarding the comparative cost of extracting, transporting and milling of ore on the Comstock, yet it is a well-known fact that no Comstock mining company has seen its way clear to make ore, whose battery assay is below \$20 per ton, pay dividends, which causes the many to accept the assertion that through the tunnel system ore going over \$8 per ton can be made to pay. Doubtless in the latter estimate the mills are to be owned by the tunnel company and not by a mill ring, and that being the case, only a reasonable charge will be made above the estimated wear and tear of machinery and actual cost of running the mills. It is claimed by some miners and millmen that at \$3 per ton for milling, the worst character of ore found on the Comstock lode, there is large profit to mill-owners. If that be the case, and judging from the cost of milling in other districts, there is no reason to doubt it, then the statement that the ore can be extracted, transported and milled through the tunnel system at an expense of not exceeding \$8 per ton, can be accepted as reasonably correct.

A Cement-Gravel Mill.

One of Dodge's new cement-gravel mills has been put at work at the Butte King mine, Chapparral, Butte county. It is crushing 100 tons a day of cement gravel, which is hard enough to have to be blasted out. The cobbles and gravel are not crushed in this mill, but pass out at one side while the cement is removed from them and disintegrated and the gold freed.

The gold-bearing cement, cobbles, etc., pass in through a hopper and the mill is rotated. The ground-up fine stuff and gold pass out through a screen, the stone not being crushed at all. Every three or four days the mill is

stopped and the coarse gold taken out.

The Butte King is a drift mine and the gravel was too hard to be worked on a floor and in sluices. This mill is intended to displace the ordinary cement stamp mill, and its advantage is that it crushes only the gold-bearing material and not the barren cobbles. In this way a large amount of cement may be worked daily. The drift miners who have seen this mill at work are greatly pleased with it.

Native Alloy of Nickel and Iron.

Prof. G. H. Ulrich last year read a paper before the London Geological Society "On the Discovery, Mode of Occurrence and Distribution of the Nickel-Iron Alloy, 'Awaruite,' on the West Coast of the South Island of New Zealand." His conclusions are important in view of discoveries on the California coast, as will appear further on.

The discovery was made in a collection of minerals sent to the Government laboratory by Mr. Macfarlane. Mr. Skey, the Government analyst, who found the new alloy in small grains or scales in a sample of black sand reported and supposed to have been saved by alluvial miners in Gorge river. Its quantitative chemical composition as = Ni=67.63; Co.=0.70; Fe=31.02; S=0.22; SiO₂=0.43; Formula = 2 Ni+Fe; Sp. Gr.=8.1. Hardness about 5, strongly magnetic. Among other minerals in the black sand was a hydrous ferruginous serpentine, which proves to be the matrix of the alloy. The rock is described as being a dark green serpentine, and the alloy was traced and found in it in small metallic specks.

The first sample of Awaruite bearing black sand examined by Mr. Skey, was supposed to have come from Barn hay, but it was subsequently proved to have been washed from the drift of the Gorge river. The valley of this river has since generally been considered the only place of occurrence of this mineral. Mr. G. Maeller, the Chief Surveyor, says the mineral is found in the bed and banks of the river.

As in consideration of the large extent of the peridotite, or serpentine rocks, it seemed to Prof. Ulrich very unlikely that the occurrence of the mineral should be confined to the Gorge river only, he specially requested Mr. R. Paulin, before he set out on his exploring and prospecting trip, to look out for the alloy in the Olivine and serpentine rocks and the drift of the rivers and creeks. This gentleman found small specks in the rocks of various localities, the most conspicuous at Silver creek, and thought it occurred throughout the whole formation. The free nickel found in the different river-beds, was much coarser than any he had seen in the stone. The area of distribution of the Awaruite was then proved to be far more extensive than at first imagined, and Prof. Ulrich sees nothing unreasonable in his belief that the mineral occurs in the impregnated matrix throughout the whole extent of the peridotite and serpentine rocks and inferentially in the liberated state in the drifts derived therefrom.

The gradual gathering of practical proof of this, however, may take a long time, owing to the great hardships and dangers connected with prospecting in the wild, inhospitable district referred to. The supposed recognition of awaruite distributed through the rock will also, in many cases, not be free from doubt, owing to the smallness of the specks and their frequent association with, and general resemblance in color to, grains of pyrites, which may therefore be easily mistaken for it. The simplest test in the case of detached specks is by application of the magnet, which energetically attracts the awaruite specks, but leaves those of pyrite unaffected. The malleability of the specks affords another proof of their identity.

The native alloy of platinum and iridosmine, which occurs with the gold in the black sands on the sea beach at Port Oxford and at other parts of this coast, very much resembles the awaruite, and although the platinum alloy only contains about four per cent of iron, yet strangely enough it is strongly magnetic.

The platinum alloy has not as yet been discovered in place, so that the serpentine rocks near Smith's river and at other points on this coast should be carefully examined. The specks or scales are so small that they may easily be taken for grains of pyrite, as stated, so that care must be exercised.

THE LAMBERTON ORE-CRUSHING MILL.

PLAN OF LAMBERTON MILL.

Gas Cut-off for Blast Furnace.

In continuing the extracts from D. Wedding's paper on the "Progress of German Practice in Metallurgy," which we have been making of late, cuts are given, showing the gas cut-off for blast furnaces, and the arrangement of checkerwork for hot-blast stoves.

Brick hot-blast stoves are so nearly universal that iron stoves can be found at few works. The former have proved economical wherever the blast is to have at least 600° C. of temperature. With well-built iron-pipe stoves, 500° to 550° C. can be maintained without difficulty, as is proved at Gleiwitz. The opposition to brick stoves lasted longest in Upper Silesia, where the immense quantity of zinc dust (oxide) carried by the tunnel blast gas rendered the economy and even the operation of such stoves problematical. When they were finally adopted, their employment required a careful preheating of the gas, which was performed first in the dry way, afterward by means of water spray. And it is still necessary in cases (frequent in Upper Silesia) where the ores carry zinc, to blow out the stoves by letting the blast pass through them for a brief period (often not more than a second) before admitting it to the blast furnace.

Iron stoves have been, and will be with good reason, retained where a low-silicon gray or mottled iron is made, especially for chill-castings, to which end, it is true, a cold blast is not, according to the ancient prejudice, necessary, but the blast should not be hotter than

300° C. It is certainly an error to employ brick stoves for low temperatures. They give their best results at a blast temperature of 900° C. In form these stoves have followed the well-known line of development, from the original checkerwork to vertical cylindrical or prismatic flues.

For a long time, difficulty was encountered

in so conducting the burned gases as to heat uniformly the entire cross-area of the apparatus; and engineer Bocker, at Friedenshütte, near Morgenthau, in Upper Silesia, effected an important improvement when, instead of giving a uniform cross-area to his gas-flues, he made those in the center, where the gases traverse the shortest path, smaller than those

at the sides, through which the path is longer. Fig. 1 shows his construction. The same end has been sought of late in Luxemburg by means of slide-valves, apparently a less simple and effective device.

To prevent the gas from striking back into the blast pipe, the simple Steffen "spectacles" (Brillen), shown in Figs. 2-5, are largely employed.

The blast-furnace gases are, of course, primarily used for heating the blast, but secondarily, also, in raising steam, particularly for the blowing-engines. A disaster at Friedenshütte in Upper Silesia, which spread consternation through the whole district, namely, the simultaneous explosion of a set of 22 boilers, heated with blast-furnace gas, gave rise to a thorough re-examination of the subject of firing under boilers with gas. While it was proved that even a serious gas-explosion under such circumstances could not possibly produce of itself such frightful effects as this instance presented, still it was not disproved that the impulse to the beginning of a steam-explosion might possibly be occasioned by the accumulation and subsequent explosion of unburned gas in the flues beneath and between the boilers. All the witnesses of the Friedenshütte catastrophe became its victims, and a complete explanation of it can never be given. But in rebuilding the boiler-department of the works, great care was exercised to secure, by means of regenerators in front of the gas-jets, the spontaneous and certain ignition of the gas-current whenever, after any brief intermission, it may be again directed under the boilers.

SHEET IRON PIPE

ALL SIZES, FOR GAS, STEAM AND WATER.

— WE MANUFACTURE —

SHEET IRON AND STEEL PIPE,

ALL SIZES,

For Water Supply, Mining, Irrigating Purposes, Stock Ranches, Etc.

Made in Lengths Desired from 16 to 30 feet.

The Cut shows a Section of Three Joints

DOUBLE RIVETED SHEET IRON PIPE.

In the manufacture of this Pipe, we use only a high grade of annealed Charcoal Iron of great tensile strength. The weight or thickness of metal used, is graded according to service required, and pressure to which the Pipe will be subjected.

FOR ALL UNDERGROUND PURPOSES, we immerse the Pipe in a bath containing a special mixture of ASPHALTUM, BITUM and PETROLEUM, at a Temperature of 300° Fahrenheit. It thus receives a thorough coating, both inside and outside, rendering it impervious to the alkalies of the earth, rust, etc., and is practically indestructible.

CORRUGATED IRON,

Black, Painted and Galvanized, for Roof and Sides of

The following brief list, by telegraph, for Sept. 22, will appear more complete upon receipt of mail advices: California—Theodore M. Connor, Los Angeles, notified wire fab le machine; Harry G. Cox, Alvarado, harness; Beau Hooker, San Diego, compound for preserving ship's bottoms, etc.; Frank E. Smith, San Jose, outfit for electric program clock; Henry Thibault and C. D. Harlin, Stockton, engine; W. M. Betts, S. F., auxiliary safety spring.

Oregon—Samuel Froedenrich and T. J. Gelsler, Portland, piano attachment.
 Notes.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

GANG PLOW.—Francis M. Mecum, Chico, Butte Co. No. 459,524. Dated Sept. 15, 1891. This invention relates to devices by which the plows of a gang may be more easily and accurately adjusted with relation to their work and it consists of a novel mechanism by which the plows and frame may be raised or depressed with reference to the land wheel, a means for preventing the plows from running too far into the land by setting the furrow wheel at an angle when the plows are at work, so that it acts as a brace against the side of the furrow, said wheel being easily adjusted to run in a vertical plane parallel with the opposite wheel whenever desired. The pole is also adjustable with reference to the frame so that the plows may be inclined to run into or out of the ground at pleasure.

REVERSING VALVE-GEAR FOR ENGINES.—James C. Nicholson, S. F. No. 459,525. Dated Sept. 15, 1891. This invention relates to a peculiar arrangement of engine valve gear. It consists essentially of a ring or disk mounted upon the crank shaft in a plane oblique to the plane of rotation of the shaft, and this ring is connected with the engine valves, so that its oscillations are communicated to the valves at the proper intervals to admit steam to the cylinder and cut it off. By suitable mechanism, the movements of the valves are changed to reverse the engine, and the supply of steam is cut off at any desired point in the stroke to suit the work. The device serves in place of a link motion with fewer parts and greater simplicity, and is applicable to any engines which must be reversible and which use a variable cut off.

CLAMP FOR PLANERS OR OTHER MACHINES.—Alexander N. Chambers and John P. Wallace, S. F. No. 459,530. Dated Sept. 15, 1891. This is an improved adjustable clamp for use upon planers, drilling, shaping and other machines. The base or shank of the clamp has flanges extending horizontally on either side, these flanges being of sufficient thickness to enter the grooves or slots in the bed-plate, while the body or shank extends up through the narrower portion of the slot to the face of the table, and to the bottom of the clamp, of which it forms an extension. Vertical set-screws pass through outwardly extending lugs, and these screws may be turned down so as to press upon the table or bed-plate after the foot of the clamp has been inserted in its channel and moved to the desired place. These set-screws serve to hold the clamp firmly in place, and any article which is to be secured to the table to be planed, drilled or otherwise worked is held in place by means of horizontal screws passing through one of the vertical ends of the yoke or clamp. Any number of these clamps may be inserted in the various slots in the table so as to be applied to different parts of large pieces.

ROTARY AIR-COMPRESSOR AND PUMP.—Henry Richmann, Santa Cruz. No. 459,627. Dated Sept. 15, 1891. This improvement in rotary pumps or engines consists of an exterior case having the interior periphery formed in two intersecting arcs, a hub rotating about a shaft which forms the center of one of the arcs, so that the periphery of the hub rotates in close proximity or contact with said arc, a spindle projecting through the opposite head of the casing and in the center of the other arc, and

radially sliding pistons fitted to the hub, with packing disks in their outer ends which form contact with the periphery of one of the two intersecting arcs, which form the interior of the case. This mechanism may be used as a suction or force pump either for fluids or liquids, and it may also be used as an engine by introducing any suitable medium under pressure without materially altering the construction described.

A Mine Superintendent Murdered.

An Attempt to Steal the Derbec Bullion.

Associated Press dispatches from Nevada City dated Sept. 17th give the following information: S. Galavotti, superintendent of the Derbec drift mine, was murdered by highwaymen this morning while coming to this city with a \$5000 gold bar just cleaned up at the mine. Galavotti and J. D. Ostrom of North Bloomfield were in a two-horse buggy ascending the South Yuba river grade, 6½ miles from this city, when a rifle shot was fired from the bank above. The hall entered the back of Galavotti's head and emerged from the mouth, causing instant death.

Ostrom, who was driving, struck the horses with a whip, urging them into a run up the steep grade, just as a second shot was fired, the bullet from which entered the neck of one of the horses, but did not bring it down. A turn in the road soon took the team out of the range of the shooters. Ostrom continued to force the team up grade, holding his companion's dead body in the vehicle with one arm and being soaked from head to foot with his life blood.

Reaching the Mount Vernon House, at the head of the grade, Ostrom left Galavotti's body and hid the bullion in the brush. Then taking the uninjured horse, he rode it to this city at the utmost speed to notify the officers of the crime. He did not get a view of the robbers or hear them speak. A wagon was immediately sent out after the dead superintendent's body, accompanied by several squads of armed men.

Ostrom says he thought Galavotti's own gun had been discharged accidentally, so close was the shot fired, till the lifeless body fell backward. Ostrom grabbed it just in time to save it from going out of the buggy. He then struck the horses to get out of danger. They sprang forward just as the second shot, which struck one of the animals in the neck, was fired.

Galavotti's rifle and hat fell to the ground, but the team ran up hill like mad, the blood from the wounded horse deluging the other horse at every jump. Ostrom neither saw nor heard a word from the robbers, of which it is generally believed there were two, although Ostrom thinks there was but one.

The gold bar was brought in with the body. It contains little less than \$4000, being the semi-monthly clean-up. Galavotti, who was one of the best gravel miners in the State, leaves a widow, but no children. Scores of men are searching Yuba canyon and the outlying country in all directions, but as the territory is rugged and heavily timbered and out up with innumerable ravines there is but little chance of capturing the criminals.

The Coroner's jury this evening determined that Superintendent Galavotti came to his death from a gunshot wound received at the hands of an unknown person. The body will be taken to San Francisco to-morrow for burial. His widow, who has just arrived here with Dr. McKilloan, will with him accompany the remains. She bears up bravely under the awful ordeal. The news was broken to her at the mine this morning by Mr. McKilloan. When he told her that her husband had been badly hurt she exclaimed piteously: "Oh, tell me everything, I know my darling husband is dead, for he would never surrender to the cowards."

Galavotti formerly farmed in Monterey county. For four years he kept books at several mines in the State of Nevada. Subsequently he was similarly employed by wholesale firms in Sacramento and San Francisco. He had been superintendent of the Derbec for the last seven years.

Searchers returning from the scene of the robbery report finding one man's track leading from a clump of brush on the hill where the shots were fired. A forty-five-caliber cartridge shell was also found there. One party that took the trail claims to have followed it to Bloomfield, and thinks he has the culprit spotted.

Most of the circumstantial now go to show that there was but one highwayman. The squad that went to North Bloomfield cannot possibly get back here for several hours at least, and the result of their investigations will not be known until they return.

The Derbec Company has offered \$1000 reward for the apprehension of the criminal, in addition to the State's standing reward of \$300 for each highwayman. Governor Markham has also been requested to offer a large special reward on behalf of the State.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

Books on Assaying.

BY C. H. AARON.

PART I.—Gold and Silver Ores.—Price \$1 SECOND EDITION.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "unsuccessfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of Dressing; The Melting in Crucibles; Scorchification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Ore; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations well bound in cloth; 1891. Price, \$1, postpaid. Sold by DEWEY & CO., Publishers, No. 220 Market street, San Francisco.

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc. Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assay; Parting Process; Amalgamation; New Process; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ore—New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, \$1.75 Sold by DEWEY & CO., Publishers, No. 220 Market St., S. F.

Educational.

JOHN T. EVANS,

Assay Office and Chemical Laboratory,
 ROOMS 46 AND 47 MONTGOMERY BLOCK, 628

Blinn's Tin, Sheet-Iron and Copper-Plate Worker.

A New, Revised and Enlarged Edition, from New Type, with New Engravings.
One of the Most Popular Technical Books ever published in the United States.

JUST READY.
A PRACTICAL WORKSHOP COMPANION
TIN, SHEET-IRON
AND
COPPER-PLATE WORKERS.

Containing rules for describing various kinds of Patterns used by Tin, Sheet-Iron and Copper-Plate Workers. Practical Geometry. Mensuration of Surfaces and Solids; Tables of the Weights and Strengths of Metals and other Materials; Tables of Areas and Circumferences of Circles; Composition of Metallic Alloys and Solders, with numerous valuable Receipts and Manipulations for every-day use in this workshop. By Leroy J. Blinn, Master Mechanic. A new, revised, and enlarged edition, printed from new type and with 170 newly engraved illustrations. In one volume, 12mo, 296 pages, price \$2.50, free of postage to any address in the world.

It having been found necessary to make a new set of Electrotype plates and new engravings of this most popular book—the old ones having been worn out by actual use—it was determined to have the book re-edited and to add to it, in the different departments, new, recent and necessary matter. All of the old illustrations of patterns have been retained, and new ones have been added. The portion treating of metallic alloys and solders has been entirely rewritten, so as to have a more systematic arrangement, and to bring it abreast with the best modern practice in this interesting and important field. In all the other departments new matter has been added, every effort having been made to render the entire work, in the future, if possible, even more useful to the tin, sheet-iron and copper-plate worker than in the past.

ABSTRACT OF CONTENTS.

Rules for Describing Patterns; Practical Geometry; Mensuration of Surfaces; Mensuration of Solids; and Capacities of Bodies; Tables of Weights, etc.; Tables of the Circumferences of Circles and of the Areas of Circles; Rules for Rendering the Tables Useful; Sizes of Tinware; Capacity of Cylinders, and various other Useful Tables and Information; Practical Receipts, Varnishes, Lacquers, Cements, Metallic Alloys, Miscellaneous Receipts, Strength of Materials, with Tables. Index.

The above or any of our Books sent by mail, free of postage, at the publication prices, to any address in the world.

A circular of 4 pages, quarto, giving the full Table of Contents of this popular book, will be sent free of postage to any one in any part of the world who will furnish his address.

Our New and Enlarged Catalogue of Practical and Scientific Books, 38 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Sept. 24, 1891.

There are no new features to report in the general market. Iron workers continue to report orders ahead—cheap coal and cheap iron are in their favor. The money market is fairly easy with no marked demand from any particular quarter. The commercial and also savings banks, as a rule, report that soon after tax-collecting day they will have more available funds than they can use.

MEXICAN DOLLARS—The market is steady at around 77½ cents. There is a growing belief that better prices will prevail soon.

QUICKSILVER—Receipts the past week aggregate 247 flasks. The market is fairly firm at around \$47. European advices are said to report a very firm market under more favorable statistical advices.

SILVER—The market has been gradually strengthening, with to-day (Thursday) New York coming through at 97½ cts., while for certificates 98½ cts. is quoted. It now looks as if silver in the European markets has been cornered, and with the Indian demand now being in order, prices are liable to do very considerably better from now on. In our market holders are not offering, believing that when the Miot begins purchasing for October, higher prices will obtain. The surplus stock held in this city is not very large, about all received having been sold as soon as it came to hand.

BORAX—Receipts the past week aggregate 320 casks. The market is firm, with a good shipping demand eastward. The ship Com. Allen took out the past week for New York 2048 cts., and the steamer San Blas 1507 cts.

LIME—Receipts the past week, 3552 bbls. The market is fairly steady.

Lead—The local market is fairly steady. By the steamer San Blas, 657 cts. went forward to New York. The New York market is reported very strong, with actual sales reported at an advance over public or exchange quotations.

IRON—Imports the past week aggregate as follows: From Crescent City, 15 tons; Sunderland, 100 tons; total, 259 tons. The market is essentially unchanged. To place a large-sized consignment concessions are asked.

TIN—The market is reported strong for plate, although dull and only fairly steady for pig. Iron Age reports the New York market as follows for pig: "Importations have been heavy, and London has sent mean consolation in the shape of slightly lower range of value there. Local holders of the bulk of spot stock seem still to successfully resist the pressure of rather adverse conditions."

COPPER—There was shipped by sea the past week to New York \$345 cts. matte and 168 cts. cement. New York mail advices report that market as follows: The home consumption has improved somewhat under the influence of recent sharp cuts in prices for several lines of manufactured goods, and export movement on old contracts is still on a liberal scale, but production is doubtless more than sufficient to meet current demands, and prices merely hold their own. Lake Superior ingot has been sold to the extent of several hundred thousand pounds at 12½¢ cash for prompt delivery, and that price apparently represents inside value at this writing. Future deliveries are held firmly at 12½¢. Bids of ¼¢ less were refused. In Arizona there is hardly enough doing to fairly determine market value. The range of 12¢ to 12½¢, as to delivery, is quoted.

COKE—Imports the past week aggregate 2001 tons from Newcastle, England. The local market is reported unchanged.

COAL—Imports the past week aggregate as follows: From Seattle, 1572 tons; Sydney, 3666; Departure Bay, 835; Nainamoo, 4700; Comox, 4300; Swansea, 5695; Liverpool, 2400; Tacoma, 2050; Cook's Inlet, 152. Total, 24,810 tons. The market is reported steady for spot and near by. It is said that fully three-quarters of the cargoes on the way are carded for. For loading, a stronger tone is reported, owing to ships asking more money for freight. The registered tonnage loading at and on the way from Australian ports aggregate as follows: Newcastle, N. S. W., for San Francisco, 67,077 and 15,662 tons for San Diego; from Sydney, 952 tons for this port. Total, 91,785 tons register.

CEMENT—There are now fully 160,000 barrels of Portland cement on hand in this market, while there are afloat from British ports alone not less than 180,000 barrels. From Antwerp and Hamburg there are probably 50,000 barrels on the way. All these cargoes should arrive before the close of the year. The annual consumption in this market is from 350,000 to 400,000 barrels. The twelve months following July 1st last will probably see the largest figures exceeded. The present prices rule from 50 to 60 per cent below those charged a year ago. Some of the cheaper grades, such as the Bilglen product, are selling as low as \$2.05 a barrel, while the very best grade of London Portland cement, such as the "Gillingham" and "K. B. & S." brands, may be had for from \$2.40 to \$2.50 a barrel. Encouraged by the cheap rate, many builders are using cement instead of brick for foundations.

The company owning the iron mines 18 miles southeast of Newberry will establish their works at Newberry, a station on the Atlantic & Pacific railroad, 119 miles east from Diggett, and 148 miles west from Needles. There is plenty of water at this locality, and the situation of the land, and of the contiguous mountains, is all favorable. Mr. C. L. Hahne, of Albuquerque, accompanied by Mr. Jesse Anthony, of the same city, will in a day or two come out to Newberry and begin the survey of the grounds for the erection of their plant as well as the road from Newberry to the mines for a distance of fifteen miles. The expenditure required to erect the plant, build the road, and get the whole thing in working order, will not be less than \$500,000, but the company is said to be backed by men of unlimited means.

Mining Share Market.

Mining shares the past week under review were very strong on Thursday and held fairly firm on Friday, but after the regular call on Saturday, under systematic cross orders, they began to set off. With Con. Virginia's battery assays said to be purposely made low on that day and bear points sedulously circulated, the pool's brokers were able to send prices still lower on Monday and Tuesday without losing a share of stock, but instead they gained considerable desirable shares. These breaks, which enable them to systematically milk the street of mining shares, it is thought by well-informed operators, mean something more than a bluff and outsiders who have their stocks paid for will yet come out large winners, but before top prices are reached the pool will unquestionably not leave a stone unturned to frighten them into selling. The writer is still of the opinion expressed last July, that the chief move in the deal this fall is in the North End shares with the Middle a good second, and the Gold Hills only moving in sympathy. Yet the latter act very much as if they are likely to soon do something more than sympathize, for there has been and still is quiet but persistent buying of certain shares, and while there may be more assessments to lead outsiders astray, yet this buying by the pool is a good sign, particularly when it is considered that the water can be and probably will be taken out before the close of the year. It is known that there is below the water level rich ore to the east in two or more of the mines which goes about \$60 per ton. Aside from this it is positively known that to the west in Crown Point and running into the adjoining mines, there is high-grade ore extending from the 500 down to the 800-foot level. In Seg. Belcher there is rich ore, a continuation of that found in Belcher, but which was worked out of the latter mines.

While this is the case at that end; in the group of mines that work from the Ward shaft, work is now being done to exploit, there is some high-grade ore which is liable to be struck unless work is delayed very soon. When the powers that be were advancing the price of Potosi, rich ore was reported in the winze, where has it mysteriously gone? If the ore is as rich as it was officially claimed, why is it not shown up and extracted for the benefit of shareholders? In Chollar, to the west, there is a 500-foot ledge with several feet said to be carrying high-grade ore. This was run into some time ago. We should think the stock, under the depression which has ruled in it for weeks past, has been sufficiently concentrated to show up some of this ore, unless it pays the pool better to have it milled for the benefit of a reported ring. It is generally claimed that the Levy-Harmon Consolidation ought to show up the rich ore found to the west in both Savage and Hale and Norcross, but perhaps they wish to collect another assessment first. Miners say that both mines ought to be paying dividends instead of collecting assessments. Passing to the North End group, the writer is informed that on the 1200-level in Best and Belcher, near the Cons. Virginia line, rich ore can be run into within a few days, but instead of doing so the work in the mine appears to be of a "dead work" character. It is well known in mining circles that Cons. Virginia has rich ore to the west, but perhaps the management fears suits, if it is taken out, but then shareholders in this mine have, so far as the writer personally knows, no just cause for complaint, as it is the only mine on the ledge that gives them dividends and not assessments. In Andes they can tap the rich lode in the old Burning Moscow ground. Ophir can do the same, and it is said, has done so on the 800-foot level. In Mexican why is not the ore found to the west on the 1455-level shown up? When run into, the stock was advanced to about \$9 a share. In Union the ore reported in the days of the late J. C. Flood can be shown up to good advantage, as can the ore to the west in Sierra Nevada.

In outside shares, the Quijotas continue lifeless, as do the Tuscaroras, although prices ruling for the latter ought to tempt buyers. In the Bodies more has been done. The assessing of Mono and Bodie, with one liable to come on Bulwer, shows that they will probably have foster parents at an early day, in which event lively moves in the shares of that district can be looked for. The mines never promised so well for shareholders as they now do and persons who buy the shares for cash and pay the assessment will, with proper care, make several good turns. An interesting correspondence is going on between Dr. W. N. Griswold, President, J. H. Tingman, Secretary of the Mining Stock Association, and Col. J. W. Mackey regarding the present system of milling ore on the Comstock. It is to be hoped that the interested parties will see their way clear to make the correspondence public for the benefit of shareholders in the Comstock mines. News from the Comstock mines is not only very interesting, but of an important character, provided present work is not stopped or turned in a wrong direction. In Sierra Nevada they are in promising ground, as they are in Union. In Ophir, on the 800-foot level, important work is said to be doing in the old Burning Moscow ground and that rich ore has been struck. From Mexican, on the 1455-foot level, good news comes to hand. It now looks as if they will do something toward showing up the find made at the time the stock went up to \$9 per share. It is said that in Con. Virginia nothing much will be done toward showing up ore until soon after Col. Mackay returns from the East. In the Middle group of mines more exploiting is under way. In Savage an improvement is reported, while in Hale and Norcross ore extracting has begun. The work in the various mines in the Gold Hill group is being closely watched with much interest by mining men in general.

There are at present more coal-laden ships bound for San Francisco than ever before known, while many more are listed to leave Australian ports within the next thirty days. In the opinion of a large importer the imports of coal this year will reach 1,500,000 tons.

THE MINES BUILDING—Work upon the mines and miners' building of the World's Fair has progressed so far that the first of the trusses to support the immense central arch, 120 feet high, has been put in position.

Eastern Metal Markets.

By Telegraph.	
New York, September 24.—The following are the closing prices the past week:	
Silver in Silver in London, New York.	Copper. Lead. Tin.
Thursday.....	44 13 16 062 12 30 4 474 20 05
Friday.....	44 13 16 062 12 30 4 460 20 05
Saturday.....	44 13 16 062 12 30 4 460 20 05
Monday.....	44 13 16 062 12 35 4 624 20 05
Tuesday.....	44 13 16 97 12 40 4 524 20 05
Wednesday.....	44 97 12 40 4 65 20 05

Quicksilver is very strong with a prevailing opinion that higher prices will obtain. Borax is strong with a good demand, iron is to better inquiry. Tin is fairly steady. Lead is strongly held. Copper is bigher with a very strong tone.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

AMERICAN COMPOSITION PIPE AND PILE ARMOR CO., Sept. 18. Capital stock, \$1,000,000. Directors—W. R. Brone, C. J. Colley, E. S. Lemme, E. F. Badgley and F. A. McGee.

ARMONA ORCHARD AND VINEYARD CO., Sept. 18. Capital stock, \$95,000. Directors—E. K. Howe, W. W. Brown, J. A. Eveleth, J. W. Barbour and D. H. Porter.

EL SUENOY G. & S. M. CO., Sept. 19. Location, Tia Juana, Lower Cal. Capital stock, \$1,000,000. Directors—Manuel M. Ayala, Temescal; Bruno Z-pada, Tia Juana, Lower Cal.; Wm. Boese and Ramon L. Briones, Oakland, and Guadalupe M. de Boese, San Francisco.

BITUMEN CONS. M. CO., Sept. 19. Capital stock, \$300,000. Directors—J. A. Fairchild, E. F. Spence, G. M. Perine, A. Walrath, A. C. Bassett and J. H. Swift.

BLACK SAND MINERS—It is reported, says the *Coggett Herald*, that the black sand mine men, who came to Port Orford recently from California with a high sounding company name and large pretensions for revolutionizing that business on the beach, started in on a large scale, for a time working night and day, has since skipped the country, leaving their tools and machinery, which has been attached for wages due the miners and workmen.

WHILE the Astin (N. v.) *Advocate* says the outlook for a revival of the mining industry will bring back many old-time Astin miners, it thinks it will be quite a little while before the company can employ many more miners than are now there or very near by. At least it would be better to see further along before making a big rush for Astin.

Assessment Notices.

INYO MARBLE COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 21st day of August, 1891, an assessment of \$10.00 per share was levied upon the Capital Stock of the Corporation, payable immediately in United States gold coin to the Secretary at the office of the Company, 137 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 5th day of October, 1891, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 23d day of October, 1891, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

G. W. LUCE, Secretary.

Office, 137 Montgomery street, San Francisco, California.

DELINQUENT SALE NOTICE.

NEW EL DORADO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, El Dorado County, California.

Notice—There are delinquent upon the following described stock, on account of Assessment (No. 2) levied on the 4th day of August, 1891, the several amounts set opposite the names of the respective shareholders, as follows:

Testing and Working Silver Ores

A VALUABLE BOOK.

An Illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working samples, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles Smelting, Mexican process, Chilean process, Krochake's process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings, and setting tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

Price, post free, \$2.00. Sold by DAWK & Co., Publishers, 220 Market St.

Books on Working Ores.

BY GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By Guido Kustel, M. E. 1890.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3; coin, postage free. Sold by Dawk & Co., Publishers, 220 Market St., San Francisco, Cal.

BY C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, \$3. Sold by Dawk & Co., S. F.

Practical Treatise on Hydraulic Mining.

BY AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hardy-gurds, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid. For sale by Dawk & Co., Publishers, 220 Market St., San Francisco.

DEWEY ENGRAVING CO.

Photo and Wood Engraving, ZINCGRAPHING, ETC.

Our New Half-Tone Engravings (FACSIMILIE PHOTOPLATES)

Made Direct from Photographs, for fine Newspapers, and fine Book and Job Printing.

STAND NEXT TO STEEL PLATE ENGRAVING IN FINENESS AND PERFECTION. THEY ARE PRODUCED QUICKER AND CHEAPER THAN ANY OTHER GOOD ENGRAVINGS, THROUGH THE GREATEST INVENTION YET MADE IN PHOTO-ENGRAVING.

PHOTO-ELECTROTYPES, PHOTO-ZINCGRAPHS, WAX PROCESS ELECTROTYPES, LITHOGRAPHERS' TRANSFERS, PHOTOGRAPHING ON WOOD, STEREOPTICON VIEWS AND OTHER SPECIAL PHOTO WORK,

Promptly and reliably done by the approved processes. Designs, drawings or photographs made to order. Engravings of buildings, Portraits, Maps and Scenery and Photo Samples for Salesmen are leading specialties. Send, as early as possible, with full description for any work desired, stating size and for what use plates are wanted. Photographs and prints similar to those desired, will aid us in making definite estimates. Agents wanted. Call and see specimens, or write for samples, prices and any further information wanted, to the

TULLOCK IMPROVED ORE CONCENTRATOR.

Patented Oct. 9, 1888, and Dec., 1890.

ANGELS, CALAVERAS COUNTY, Nov 22, 1890.
JAMES TULLOCK, Esq.—Dear Sir: I am pleased to state that I have used two (2) of your Sulphuret Concentrators in the Gold Cliff Mill, since the first day of last May, and that they have given entire and splendid satisfaction, concentrating the sulphurets from 60 tons of ore every 24 hours. Your Sulphuret Concentrators are superior to any that I have seen, being simple in action, positive in effect, admirable in construction, of few mechanical parts, and admirably adapted to the concentration of any kind of sulphurets. I therefore cheerfully recommend them to the mining fraternity. Respectfully yours,
WOODSON GARRARD,
Supt. Gold Cliff Mine.

HELENA & IDAHO GOLD MINING CO., SUPERINTENDENT'S
OFFICE, GIBBONSVILLE, IDAHO, Oct. 6, 1890.
MR. JAMES TULLOCK, Angels, Cal.—Dear Sir: Mr. Arnold was saying the other day that you were talking something of coming up this way, and I have thought that perhaps you might be a little uneasy about your concentrators. You need have no anxiety about them whatever, as the one we set up is running all right and has not given a minute's trouble since starting, and the other one is all ready to start. They were so easy to set up and run that I forg't all about the "letter of instructions" until they were set up and running and you recalled to my mind your letter and instructions. Yours truly,
MYRON K. RODGERS, Supt.

ANGELS, CALAVERAS Co., Nov. 22, 1890.
JAMES TULLOCK, Esq.—Dear Sir: We have used two of your Sulphuret Concentrators in the Madison Mill, (10) ten stamps, for over six months last past, and I hereby testify that they have given every satisfaction, and in every sense fulfilled the great opinion I had formed of their superiority. They are easily handled, readily kept in order, require but little watching, are exceedingly simple in construction and absolutely positive in their work. In my opinion, they are superior to any other in the market, doing effective work in the treatment of large quantities of sands. Sincerely yours,
T. M. LANE, Supt. Madison Mine.

ANGELS CAMP, July 25, 1891.
MR. JAMES TULLOCK—Dear Sir: We are working sulphurets from mines in Calaveras and Tuolumne Cos. We find the sulphurets saved on your machines cleaner than those saved on any other. Yours truly,
THOS. N. SMITH, Supt. Utica Chlorination Works.

Price, \$450.

MINE HOISTING ENGINE

With or Without Automatic Brake, as desired.

These Engines having large drums, are particularly adapted for mines, inclines, and other rapid hoisting. The drums are either plain, lagged, or grooved as desired, and lagging or grooving is done for 2, 3, or 1 inch wire rope, as ordered. The engines being reversible, two loads or hoists may be operated at the same time, one going down and the other coming up. They are very simple and strong in design and construction, rapid in motion, easily handled and occupy but comparatively little floor space, while the best results are produced in their efficient working. Each engine is fully equipped with fittings, and supplied with automatic brake, when so specified in order. These engines are made with either friction or reversible link motion, or both as desired. These Engines are built in sections suitable for lowering down incline or shaft for underground uses.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 1300 IN USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

THE PELTON WATER WHEEL CO.

121-123 MAIN STREET, SAN FRANCISCO, CAL., U. S. A.

PELTON WATER MOTORS, Varying from the fraction of 1 up to 15 and 20-horse power, unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. Address as above.

THE GATES ORE AND ROCK BREAKER.

UNLIMITED IN CAPACITY. UNEQUALED IN EFFICIENCY, UPWARD OF 3,000 NOW IN USE. Will do more than twice the work of any other with the same cost in wear. Gives a fineness of product that increases the capacity of any mill from 25 to 40 per cent without any additional expense. THE BEST AND ONLY CRUSHER ADAPTED TO MACADAM ROAD WORK. Send for Circular.

It having come to the notice of the undersigned that their patent rights are being infringed upon, intending purchasers are hereby warned that all such infringements will be duly prosecuted. (Signed) THE PELTON WATER WHEEL CO.

BLOWING ENGINE FOR SALE.

Vertical pattern, with balanced steam slide valve gear, steam cylinder 14 in. diameter, air cylinder 40 in. diameter, stroke 24 in. 1 to 100 strokes per minute; engine new. For price and particulars address JAMES LEFFEL & CO., Springfield, Ohio.

The instrument represented in the above cut is a new and grand little invention, being designed to save life and limb, and innumerable lawsuits, by doing away with the dangerous operation of digging out wet and exploded loads where Giant Powder is used in mining. The little instrument crimps the cap on to the end of the fuse firmly and absolutely water-tight. It is also used for cutting the fuse. They are neatly gotten-up of the finest cast steel, nickel plated. Price, \$2 each, or the entire instrument finished in gold plate, \$5. N. W. MOODY, Fresno, Cal.]

FRUE ORE CONCENTRATOR

OVER 3000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

Manufactured under Patents of April 27, 1880;

September 18, 1883; July 24, 1888;

and March 31, 1891.

THOMSON-HOUSTON ELECTRIC CO.,

15 FIRST STREET, SAN FRANCISCO.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Concentrating Belt manufactured in San Francisco; we can therefore fill all orders on short notice. The length and width of these belts are the same as is used on the Frue or Triumph Concentrating Machines, but can be made of any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers, thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight rifles also save very fine sulphurates and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth.

An Electric Mining Hoist.

One of our illustrations this week is of the mining hoist made for the Black Diamond Coal Mining Co. of Washington by the Electrical Engineering Co. of San Francisco. This hoist has been successfully working at the mines since April last.

The dynamo illustrated in our issue of Aug. 29th is located near the mouth of the mine, and furnishes electrical energy for this hoist, which is at the head of a slope 3100 feet away in the mine. This slope is now 500 feet deep, and coal is hoisted from the 450-foot station, but sinking is going on to make it 900 feet, where another station will be located.

The stopping, starting and reversing movements of the hoist are effected by the movement, to or fro, of the one vertical lever.

But three-horse power of energy is absorbed by the conducting line and motor. This amount is far less than would be used to transmit the power necessary from the surface to the slope by any other known means. The Electrical Engineering Co. has taken the lead in manufacturing and installing electric mining plants on the Pacific Coast.

Underground Quartz Mills.

The discussion of milling Comstock ore has brought to the front rather an odd proposition, viz: the practicability of mining underground mills built above the Sutro tunnel level. The

THE MOLESWORTH CALCINING FURNACE—See Page 213.

The chamber would have to be well supported for such a purpose, and in it stamps would be placed for crushing every ton of ore that would pay to work. For motive power to run the stamps and pans the water now flowing to waste through the tunnel could be utilized.

This would do away with the absurdity of shipping ore from where water is flowing to

In an interview with a leading mining man, he says, in regard to the above project: "I would excavate an opening on the 1500-foot level of all the ore-producing mines sufficiently large to accommodate my batteries and pans, and that chamber should be large enough to have many more pans than are run in the mills now, in order that each obarge should be

lial necessary to run 500 stamps. This underground mill, run by water produced from the mines, would reduce the cost of milling and mining to \$3 per ton. Not a pound of ore nor waste rock should be hoisted to the surface, thus saving the vast expense of handling, hoisting and transportation. I would hoist the hullion and the miners only."

80-HORSE POWER ELECTRIC HOIST FOR THE BLACK DIAMOND MINES.

writer has spoken to several practical mining men about the project, who one and all pronounce it practicable, as did a well known millwright who is an authority on such subjects.

In building a mill underground, a dome like chamber would have to be prepared on any level either on or above the Sutro tunnel level.

waste to another place where water is only obtainable during certain months in the year, and all this shipping is done at the extra expense of hoisting, handling and rehandling the ore several times, all of which costs money; and in addition to this, there is now an exorbitant obarge for transportation,

worked six hours to each pan, instead of three hours, as worked at present by a mill interest which is adverse to a careful working of ores for the mines. For one-half the cost of ore transportation to the Carson river a pump could be erected which would raise water anywhere above the Sutro tunnel level to give a

THE Stockton Iron Works, an old establishment, was partially destroyed by fire on Tuesday. The loss was about \$6000.

SAN FRANCISCO Trades Unions are contributing money to send to the destitute miners at Franklin, Washington.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

Shasta County Mining Interests.

NUMBER 1.

[By Our Traveling Correspondent.]

Shasta has always had the reputation of having high-grade gold-bearing quartz mines. At the same time there is a general belief that the ores cannot be worked to a profit by free milling processes. I know of no county in the State where the ores are similar to those of Shasta. It is but natural that writers like Mr. A. Paul should conclude that the same conditions that exist here are to be found in all sections, if they are sought. I have seen here talc slate that assays in the hundreds, while the same slate, to all appearance, in the Gold Cliff mine at Angels goes but a dollar a ton. Now these Shasta people insist that the same gold values can be found elsewhere in the same character of slate by assaying, and charge that by the usual wet process only a small percentage of the gold value is secured. I was also shown a mixed quartz and talc slate vein matter that assayed very high, while the same looking vein matter in the Utica mine at Angels goes but \$4 a ton. Shelly, rusty quartz, that no miner would bother to mortar and that carries no visible free gold, assays in the hundreds, while quartz with a gray streak that could not be made to give up a color of free gold showed up in hundreds under assay. Quartz that apparently carried a small percentage of copper pyrites proved to be gold covered with a film of copper. All of these tests naturally bring the Shasta miner to believe that the miners in all the other portions of the State are losing dollars while saving cents. But a closer investigation shows that this high class of ore is not the average of the vein but a small spotted part, which, owing to its similarity to the vein matter as a whole, is exceedingly difficult to sort.

Peculiarities of Ores.

When ore carries a large percentage of mineral, the miner readily infers that there is a good lot of gold with it, but when, as in Shasta ores, the richest ore shows no mineralization, and can only be proven by assay, it is but natural that the whole should be run through a mill for its free-gold contents. I have gone to some length to elucidate this matter because millmen on the line of the mother lode have felt that Mr. Paul was intimating that the millmen of the State were running their mills merely to hear the stamps drop, and did not know nor care for their losses.

It will be seen that, if my conclusions are correct, the conditions are not similar. While I have not had ores similar to these high-grade ores of Shasta, from other counties assayed, yet I believe that the ores of this class are peculiar to Shasta and to certain portions or mines of Shasta. This is undoubtedly due to the country rock which in most sections looks, with its rich metallic color, rich enough to mill. In this rich porphyritic slate the vein matter is usually high in grade and not all free, as in the Calumet mine. In the black slate the ores are very free, as is shown at the Gladstone, where the mill tailings average but 20 cents a ton, which is far lower than the average of the mines on the mother lode. In the Granite the ores here reverse the usual order, and instead of being base or refractory, as in all the other mining counties save Fresno, they are the freest milling of any veins in the county. In going through the county, the fact that many of the mines are worked down to about water level only, conveys the impression that the veins give out in gold values in depth.

While my limited time would not permit of the investigation required to prove it, still all things would point to the conclusion that when these ores reached water level and became live ore, the free gold gave out, as the sulphurets were no longer oxidized and the gold set free; hence the belief that some of these old mines have only been worked down to their greatest, instead of least, value. What confirms me in this belief is the character and high grade of ore that is now being sorted and smelted from these old mines that never had, in all their past history, any ore of like value.

In addition to the quartz veins of the county, Shasta has in the Iron Mountain mine a deposit of mineral that is not excelled, if equaled, in any portion of the United States. To treat the ore of the county a great variety of processes have been employed in the past, with several modern methods. The MacArthur-Forrest cyanide process, among others, is now in course of trial. In addition, there are a number of the old dividend-producing stamp-mills.

Sorting Ores.

Some of these are running on ores that may be called strictly free milling, while others are on mines where the higher-grade ores are soaked and shipped to be smelted, and the ore not high enough in value to pay charges is milled. A few of the mines sort all of their ore, ship what is high enough in grade, and dump the balance. In some cases ore running \$40 a ton are thrown over the dump, as the gold is not free and it will not pay to ship. In addition to the large amount of ore shipped by the mines direct, Mr. Joseph Bell of Shasta has equipped sampling works at that

place where he samples and buys ore for shipment. His output this year will exceed \$100,000, in value. Mr. Bell is familiar with the Colorado method of sorting ores, and it is largely due to him that the mine owners have discovered the fact that their apparently barren ores are high in assay value, though poor in free gold. Perhaps the most interesting method now being tried for the extraction of the gold contents of the ores is

The McArthur Forrest Process.

Or the cyanide process, as it is generally called. Some time since, Mr. Almarin Paul of the Calumet mine, visited Denver, Colo., and inspected the process. Becoming convinced that the process was a success, he operated it on the ores of the Calumet mine. This test proving satisfactory, a company purchased the sole rights to Shasta, Trinity and Siskiyou counties, and incorporated under the title of the Shasta Gold Ex. Co., Almarin B. Paul, manager. The works are immediately opposite to the Calumet mine's mill and on the west bank of the Sacramento river. About two miles above Middle creek, and directly on the line of the Oregon & Cal. R. R.

The plant is intended solely for the working of the McArthur Forrest process, not alone on the ore of the three counties that the company owns entire, but for all ores that may be shipped from all portions of the coast. The situation is all that could be desired in railroad facilities, water and millsite that will admit of automatic handling of the ore. The plant will treat 10 tons of ore every 24 hours, and is so arranged that different lots of ore can be treated at the same time. In the treatment of the ore, the first operation is the drying of the ore. Then the ore is passed through a rock-breaker and into bins, from which it is fed into a Paul barrel-pulverizer, and when powdered, the ore is placed into agitators and a one per cent solution of cyanide of potassium added. After an agitation of six to 12 hours, the liquor is drawn off into filtering tubs. These filters are of wash gravel covered with canvas. The liquor passes through the filter and into storage tanks. From this, the solution is drawn into a chest of zinc filters, each filled with zinc shavings.

The liquor flows down through the first, up through the second, down through the third and so on out to the end of the eight filters. The gold is precipitated upon the zinc shavings in the form of a brown powder. When desired the chest is unlocked, the zinc shavings washed in clear water, which separates the gold. When it has settled the water is drawn off and the gold, in the form of a brown powder, melted into bars. The liquor from the filtering tank is pumped back up to the first tank and sufficient cyanide of potassium added to bring the solution up to the original one per cent. As will be seen the process is very simple, no roasting of ores being needed, and no high-priced chemicals required, with a very small loss of material used. The inventors claim that it is possible to treat all ores at a cost of from \$2.50 to \$3 a ton and save from 85 to 99 per cent of the gold and silver value.

The inventors claim that while the one per cent solution of cyanide of potassium will dissolve all of the gold and silver contents of the ore by their treatment the other metals are not affected. I have been repeatedly asked for information concerning this method and so have given it what might be called a good deal of "free advertisement," realizing that if the process will do all that is claimed for it, that it will give quartz mining a boom as great as that which hydraulic mining would receive were the injunction removed. As numerous parties have failed in making small working tests of this process, it may not be amiss to state that very often cyanide of potassium is not more than half to two-thirds full strength, and it is therefore necessary to know the exact per cent of the cyanide as well as to follow the company's method of treatment.

By the time this article is published the works will be in full operation, and once the matter is given a thorough working test Mr. A. Paul has promised to give the readers of the PRESS the results in one of his usual able articles.

The Gold Run Reduction Works.

W. P. Miller is superintendent of these works. They are located on Gold Run, 3 miles northwest of Redding, on the line of the California and Oregon Railroad. Mr. Miller has only a part of his works in place. When completed he expects to treat the base ore of this district by a process of his own that he is satisfied will give satisfactory returns.

The leading mines of Shasta are in zones, through which the veins are gold-bearing, with locations extending from one to the other, making an unbroken location, miles in length, but owned and operated by different mining companies. Away from these belts in these sections the veins seem to be either wanting or barren. There are, however, a number of mines scattered here and there throughout the county which as yet have not been traced and developed to any extent.

The Gladstone M. and M. Co.

C. J. Clarke is superintendent of this property. The company is a Cleveland corporation, who under Captain Clarke have secured a large area of mining ground adjoining the Gladstone, which is situated 4 miles northeast of French Gulch.

The company own the Gladstone, Helena, Shed, Jumbo, Climax, Cumberland, Bookeye

and Giant locations, all on one vein. The principal development is on, and the ore supply from, the Gladstone. The mine is developed and operated through a system of tunnels. No. 1, or the lower tunnel, crosses 230 feet to the vein, with drifts run 400 feet east and 500 feet west on the vein. The vein is cut 700 feet deep in these workings.

Tunnel No. 2 is 400 feet on the vein. No. 3 is 300 feet on the vein, while the fourth tunnel is in but 75 feet. The vein runs from two to twenty feet in width and carries throughout the workings an average value of \$9 a ton. This is not from shoot ore, but from the entire quartz extracted in and from all of the workings.

Contrary to the general opinion of Shasta's ore, the ore of the company's mines are exceedingly free in milling. The most careful and complete records of the mine's and mill's workings are kept by the superintendent, which show that the tailings at no time have gone over \$1 a ton, while the average is but 20 cents, a showing seldom equaled. The quartz is inclosed in slate walls. The mill is of 20 stamps, given 6½ inches drop, with double system of plates and concentrators. Owing to the very free character of the gold the ore's values are almost all caught in the battery.

In addition to the present plant the Captain is putting in three Edison electric drills, the first on the coast. Captain Clarke has been extensively engaged in mining all over the mining sections of the United States, but is convinced that in the Gladstone, where all the ore from a distance of 2000 feet averaged \$9 a ton, with a two to twenty foot to draw on, that he has "as good as there is a-going," and everything looks that way.

Other mines of the county I will mention in my next letter. E. H. SCHAEFFLE.

Washington Mines.

The Cascades Rich in Metallic Wealth.

EDITORS PRESS:—Last year I wrote you an article concerning the mining outlook of the "Evergreen State," as known at that time, and now I have a great deal more to offer on the subject.

During the past year I have been actively engaged in the pursuit of exploration and mining from the Columbia river to the British line. Most of my work and observations are being confined to the grand old Cascade range itself, and I find in these mountains

Metallic Wealth

That will insure vast fortunes to a great number of our citizens. Here we find gold, silver, copper, lead, iron and other mines in goodly numbers and of splendid richness. All of Western Washington is underlaid with extensive coal measures. Millions of acres of these coal beds are already known. Nor is this all. The magnificent evergreen forests amount to considerable, as there are no better timber lands in the United States. It requires no genius to foretell the import of all this. The implication is obvious. In the near future this State of Washington will stand supreme in its wonderful natural resources and become a commonwealth second to none in Uncle Sam's domain.

We have the metal, the coal, the timber and the soil. Our climate is salubrious and delightfully temperate, and the man that don't like our weather, rain, sunshine and all, of course, he ought to be sent to "Sheol." No doubt about it. Perfectly natural. Why shouldn't he be? We have no such place here, and as a reminder of the fact, there are nine Seattle "ministers" to-day playing against nine Seattle lawyers in a game of baseball. Of course there are a few people here who have not "gone crazy" on "town lots" and baseball, but the "infection of amusement" is as contagious that just what you don't expect is sure to come true. Pardon the digression. Washington mine! Yes, we have them already by the hundreds. In a dozen different districts along the Cascades there have been numerous and valuable discoveries made this season. The great lead-copper-silver belt lies along the summit region, on both sides of the range. The outcrops show on tops of the mountains, on the sides, and in the bottoms of the deep canyons.

Both east and west from the divide, for 20 miles, and along the great range for 300 miles the formation is geologically favorable for the existence of rich and extensive mines. The writer has already examined many valuable properties. These are gold, silver, copper and lead and range in grade from \$10 into the thousands per ton. Placer gold occurs also, and such should be looked for in the canyons and creek beds cutting through the auriferous quartz lodes. Lying before me now is a handsome \$50 nugget, recently taken out, and it is a fact that gold nuggets weighing over 50 ounces have been found in the Cascades of Washington. The mining outlook is indeed bright in this State, and during this season millions of dollars worth of mining property has been discovered.

A splendid beginning has been made. Our future is assured from the simple fact that our mountains are highly metalliferous. *Au revoir.* Seattle, Wash. CHAS. F. BLACKBURN.

The breaking of the pump-rod at the Alta mine, Virginia, last week put several men in a perilous position. They were imprisoned underground 14 hours, but came out all right.

Developments in Mariposa County.

The San Rafael Mine and Yosemite Park.

EDITORS PRESS:—Whenever there is any possible chance for a growl in Mariposa county about hard times, etc., the growl will come forth. It is therefore not more than right to set forth if anything occurs which puts the resources of Mariposa county in a favorable light. Such an occurrence is the development of the San Rafael mine, near the old mining village of Colorado, and owned by Mr. John Francis and other gentlemen from San Jose.

It is not a new discovery of a hidden mine, either. It is a vein with large outcroppings that has been known ever since the county was settled. It had been taken up and held for years by some Mexican miners, who, it is presumed, whenever they had to pay for some grub, went there and panned out as much gold as was needed at the time, but anything like systematic work had not been done on the vein till Mr. Francis, who had got some inkling of it, looked at it, prospected and boned it. He then went to work, run in some drifts at one place, and sunk a shaft at another place, and finding a good vein in the drifts and extraordinary rich ore in the shaft, but also a great deal of water, started a drainage tunnel at the proper place to drain the mine. Before the tunnel was in far enough to strike the vein the bond was about to expire, so Mr. Francis bought the mine outright. Since the purchase the vein has been struck in the tunnel. It is there about six feet thick, consisting of ribbon ore, which prospects by mill process for the whole six feet of the vein from \$8 to \$10 per ton.

The developments are as follows: The shaft is 40 feet deep, showing a vein of an average thickness of six feet, and at the bottom, where it prospects better than in any other place of seven feet, the ore, by milling process, will pay \$50 to \$60 per ton.

Something over 500 feet east of the shaft, in a gulch where the vein showed big, a drift was run in each way from said gulch; the drift running west toward the shaft is in 225 feet. The vein there averages five feet in thickness. The drift running east is 220 feet in and the vein averages 3½ feet. The ore in the drift gives a mill test of \$18 per ton.

The drainage tunnel is in 535 feet. It is perpendicularly 300 feet below the surface of the vein, where it strikes it. As the vein pitches about 60° south, it will give a lift of about 350 feet on the vein. The tunnel runs water enough to run 15 to 20 stamps. The owners own water privileges besides to run 15 to 20 stamps more. The vein is in a black slate formation, which is strongly mineralized with iron pyrites, and runs east and west, dipping south at about 60°. It is conveniently accessible by a good wagon-road, and the adjacent country is well provided with timber.

There is one circumstance connected with this mine, on which the people of Mariposa county are to be especially congratulated, and that is that this mine is outside of that creation of the last Congress—the Yosemite Park—by which name the territory set apart by the act of Congress approved Oct. 1, 1890, "setting apart certain tracts of land in the State of California as forest reservations," is generally known. The San Rafael mine just lies about 1½ miles west of the western boundary line of this Park. Therefore, it is not included in the territory, in which it will be the duty of the Secretary of the Interior, according to the Act, "to preserve the mineral deposits from injury and retain them in their natural condition," thereby smothering valuable interests and choking off all enterprise to develop them. But this mine will be worked, and will give employment to many miners and other laboring men. It will cause the construction and erection of valuable machinery and will help business of all kinds. The treasures extracted will course through thousands of the arteries of commerce, and it is to be hoped its owners will be enriched.

This brings home the question, How many many mines like this may not be contained in this Congressional creation of the Yosemite Park as a forest reservation? There are in townships 2, 3 and 4, south of ranges 19 and 20 east M. D. M., all in this reservation, below the Yosemite valley, and nearly entirely in Mariposa county, the Hite, Crauberry, Rathford, Ferguson, Feliciano, Sweetwater, Bear Creek and other mines, that are known to have produced, not a million, but millions, of dollars in gold. There are other mines and mining locations, too numerous to mention, that only await development. There are large districts known to be auriferous, but almost entirely unprospected yet; there are large deposits of marble and other minerals, which will be of great value whenever they become practically accessible. How many mines of enormous value may not be contained in the six townships above mentioned? For what good, for whose benefit, are those mineral deposits to be "retained in their natural condition"? As a forest reservation? When there are on stretches of miles and miles, in fact when on three-fourths of the townships mentioned there are no forests at all, when in other portions forests are so situated that, on account of their difficulty of access, they never will be commercially available.

Some portions of these townships contain as fine forests as there are in the world, and they

are also easy of access, but do not on people need some timber also? And the cutting off of full-grown trees, instead of letting them fall down and rot, does not destroy a forest. Go the contrary, by giving light and air, it encourages the new growth to spring up spontaneously.

We do not mention the agricultural and horticultural interests that are threatened to be smothered by this Congressional creation, as we only set out to speak of mines.

That the San Rafael mine is not on this so-called Yosemite Park, we consider a downright streak of luck for Meripose county; in having a vein that has held open and in plain sight for over 40 years, promising to become one of the richest mines this county ever had, as soon as there was a pick struck into it in earnest, is also—luck!

We believe there is more such luck lying around here, and would be found if it was looked for.

N.

Nevada Miners' Unions.

EDITORS PRESS:—The Gold Hill Miners' Union is the pioneer union of the coast. It was organized December 8, 1866. It had 20 charter members, only one of whom is now living—Wm. McNamara, who is in his 62d year. Mr. McNamara is a tall, raven-haired six-footer and shows a rugged constitution. He had many interesting experiences to relate to your correspondent.

The Virginia City Miners' Union was organized July 4, 1867, with 65 charter members, six of whom are now living, viz.: Peter Leonard, Alex Ensey, Wm. Trize, Maurice Flynn, T. W. Goldworthy and Michael Cammelford.

The union has numbered over 1200 members and now has about 1140 in good standing. The union has a fine library hall, a two-story brick, 40x100, well lighted and heated, making it a pleasant home for miners. The library contains 4015 volumes, 26 papers and magazines, among which may be found the MINING AND SCIENTIFIC PRESS, which is highly prized. Here can also be found games of entertainment and amusement, and complete sets of prospecting tools for miner's use. T. H. Smith is the honored president and Bernard Coyle the rolls secretary.

GANO KENNEDY.

Miner's Mass Convention.

A mass convention of the miners of the entire Southwest is to be held in El Paso sometime in December. Prof. Chas. Longmire is exerting every effort and doing stalwart work to make of this convention the largest and most representative of the mining interest of any ever held. The convention is to be political in no sense whatever. The subjects to be considered are two in number, viz: The Alien Law and Free Coinage of Silver. Every mining camp and mine in the Territory of New Mexico, Arizona and Utah, and the State of Texas should be largely represented, and undoubtedly New Mexico, Arizona and Texas will have representatives from every camp and mine of value. As stated above, the convention is to be non-political in character and is gotten up with a view to obtaining the concerted action and combined support of the miners of the State and territories named, upon these subjects, which are of such vital interest to miners of the Southwest. The Alien Law has virtually closed the mines of New Mexico, Arizona and Utah. Foreign capital, which would have been invested in our mines, and made of many of our prospectors and miners men of wealth, has gone to Colorado and other States which this legislation did not affect. This is food for the thought of New Mexico miners and there is ample time between now and December to reflect upon the subject. The subject of "free lead" will not be sprung and if you are for "Free Coinage" of the American silver product only, you can go to El Paso with the assurance that there will be scores there who are with you on the subject. As territories New Mexico and Arizona are next to powerless, but with the aid of the Texas delegation in Congress and a memorial to the President and Congress much and lasting good may result from this convention.—Rio Grande Republican.

Marine Engineers.

The annual election of the Marine Engineers' Beneficial Association, which took place last week, resulted in the following selection of officers: President, E. W. Tacker; Vice-President, F. A. Jones; Treasurer, G. H. Fairchild; Corresponding and Recording Secretary, Chas. True; Financial Secretary, W. D. Nelson; Chaplain, G. H. Crossley; Conductor, Thomas Spenser; Doorkeeper, Richard Pearson. The Past President is D. C. Martin. Board of Trustees—C. C. Looy, J. S. Richards, D. C. Martin, A. McDonald, J. J. Corcoran, W. K. Martland. Delegates to the National Convention—W. D. Nelson and A. H. Kress.

The Marine Engineers' Association is one of the strongest organizations on the coast. The members are drawn together by social as well as benevolent bands, and their meeting rooms are among the most popular headquarters in the city. About two months ago they moved into the apartments which they now occupy on Mission and East streets, and every day has witnessed something new in the way of decoration by the enthusiastic members.

The officers were most delightfully surprised

recently by the appearance of a handsome billiard table, on the rail of which was the inscription, "Presented to the Marine Engineers' Beneficial Association by the Risdon Iron Works." The Union Iron Works sent two handsome pictures, one of the Charleston and one of the San Francisco. A valuable library of marine works was the gift of W. T. Garrett's friends.

Patents to Hydraulic Mines.

B. J. Watson of Nevada City recently delivered an address before the Seventeenth Agricultural District Association, in which reference was made to the hydraulic mining question. Hon. Geo. Ohleyer of Yuba City took exception to some of the statements made and published an answer. Mr. Watson now returns the compliment and publishes an open letter (in the Sacramento Bee) addressed to Mr. Ohleyer. We have only space for an extract from Mr. Watson's communication in which he refers to the understanding the miners had with the Government when purchasing the gravel mines. Mr. Watson says:

"You also find fault with my statement that, after having paid double price for their mineral land, the Government had given the miners a patent permitting them to work by hydraulic process, had allowed them to expend the earnings of a lifetime under sanction of laws made especially for the purpose, by both State and National legislatures, and then permitted a Judge of one of its inferior courts, with one stroke of his pen, to render them penniless and to deprive them of the right to make a living the only way they knew how."

"You plead ignorance of such an understanding with respect to the sale by the Government of its mineral land."

"Without attempting to quote United States laws to show what was the understanding of the Government when it sold its mineral lands, I will content myself with drawing a conclusion from one of its patents, which I have before me."

"It is headed by a third of a page vignette, over which is printed 'The United States of America.' In the background is the National Capitol building with cities in the distance."

In the foreground is the picture of a hydraulic mine in full operation with five monitors playing upon a bank of gravel."

In the right foreground is a long stretch of pipe-line connecting with a tank reservoir, and other appliances familiar to hydraulic miners, while in the center foreground stands the American eagle, with wings outstretched, with *E Pluribus Unum* on the banner which streams from his beak, as if he were the guardian angel of the industry whose operations surround him."

My dear sir, what do you think the poor miner who had expended his life's earnings in developing such mineral lands thought that vignette meant when he received it.

Besides, in the body of the patent is clause fifth, which says: "That in the absence of necessary legislation by Congress, the Legislature of California may provide rules for working the mining claim or premises hereby granted, involving easements, drainage and other necessary means to the complete development thereof." What did this mean?

You know as well as I do that both Congress and the State Legislature passed laws encouraging gravel mining and the courts upheld the laws for over 30 years.

An honest miner would infer from these facts that the Government had authorized him to prosecute the business of mining in the latest approved manner, which way was pictured out on his patent granted by that Government.

The Government owned these mineral lands before it disposed of them to the miner, and it also owned, and still owns, the rivers into which the debris from the mines will necessarily run. It must of necessity have comprehended what it was doing when it entered into this contract with the purchasers of its mineral lands; but it permits one of its judges of a circuit court ("inferior court," if you please), to declare the contract off, after it had permitted and encouraged honest law-abiding citizens to invest their all in opening mines, building long and expensive canals, costly and spacious reservoirs, in erecting machinery and building cozy homes, all of which are rendered worthless by the court's edict. If that is not bad faith, cruel injustice and unheard of wrong, I am no judge of human action.

While residents of the valleys adjoining natural water courses have been damaged, they have suffered nothing like the injustice meted out to miners. The former knew when they bought their lands that mining had been in operation for a long period of time, and that the Government, which owned both agricultural and mineral land, and the valley streams, had not only permitted, but had encouraged the washing of gravel to obtain gold long before they purchased the lands adjoining those rivers. They went into the transaction with their eyes open.

But mining communities admit that where damage has resulted from mining, compensation should be given and means adjusted that will prevent future damage. They believe remedial measures may be adopted that will remedy the difficulty.

The Irrigation convention during its session this week in San Francisco declared unmistakably in favor of competing railroads. A permanent organization was perfected.

Esmeralda County Mines.

A Reno Gazette reporter accompanied S. A. Knapp of Hawthorne from Carson to Reno on Monday, and gleaned the following interesting news regarding the mining outlook of that county. Mr. Knapp sold the Fairmount mine, which is about 11 miles from Hawthorne, was being vigorously worked now. The mine was located about ten years ago, and about \$100,000 was taken out when the vein gave out and was lost. The mine has been worked for the past two years, and about 60 days ago the lost ledge was found, and some ore taken out, the first shipment of which has just been made of 8 1/2 tons and the returns showed 230 ounces of silver to the ton; and in taking out the ore, another ore body in the vein, lying under it, was found about ten inches wide, and within the last few days about one ton has been taken out that gave 2400 ounces, and the vein is going down very strong in the bottom and the company is following it down with a winze. This ore body promises to be very extensive, for they have traced the vein about 1200 feet, and the present depth of the work is about 200 feet below the surface on the pitch of the vein. Relative to other mines in that county, Mr. Knapp said: "There are a number yielding both gold and silver, among which may be mentioned the Pimlico. This mine produced from 1887 to 1889, \$150,000 in bullion, from which dividends amounting to \$77,000 were paid. The mine was closed down at that time on account of litigation, but work has been resumed within the last 30 days. The Lapanta, which is situated near by, has the peculiarity of being a gold mine in a limestone formation. This mine has produced about \$130,000 and paid about \$30,000 in dividends. The ore body has been followed for a total length of about 1600 feet and to a depth of about 150 feet. In its lowest workings, what promises to be a very extensive body of ore has been recently cut. The ore body being as high as 16 feet wide, contains iron and quartz, in which there is a pay streak of from eighteen inches to three feet wide, and which will mill about \$75 per ton. The balance of the ore yielding from \$8 to \$12. Work is being actively prosecuted at present opening up this find."

The Central mine, situated about 11 miles from Hawthorne, is a combination of lead, silver and gold—45 per cent lead, 35 to 40 ounces of silver and about \$35 in gold. The ore vein averages about two feet wide and has been followed by an incline on the vein to a depth of about 150 feet. The bottom shows very strong. Regular shipments are being made to smelters below.

In addition to the mines already mentioned, there are a great many prospects on which some work has been done, and are producing some ore. The Confidence mine, about 14 miles from Hawthorne, was worked for the first time about two years ago. The ore is silver, and some of it runs as high as 1800 ounces to the ton. Since work was commenced, the output of the mine has been about \$32,000—\$15,000 of which was paid in dividends. Within the past few days a very important strike has been made in the vicinity of this mine, and known as the Esmeralda. The ore is of the same character as the Confidence ore, black metal and horn silver. The vein is in lime stone, and a considerable portion of the gangue is spar. The vein being followed at present is about 18 inches wide, and the development of the same will be watched with a great deal of interest, as it is in a section of the country that has never been prospect before.

"You can count on the fingers of one hand all the prospectors in the county," said Mr. Knapp, "and every mine that has been developed has paid from the grass roots down."

Mr. Knapp said that there was a good field in Esmeralda for prospectors who had a little money and were willing to go into the hills and work and not do their prospecting around saloon stoves, as the most of the county is what is known as a "blind country." Besides the above-mentioned mines there is the copper district near Luning and the lead and silver mines near Marietta, which are producing wealth regularly. The silver mines in Gladding mountain and in Gille Mountain district and in the Liberty mining district, all of which are producing considerable ore, in every instance show favorable prospects for prominent mines. Mr. Knapp is highly pleased with his prospects and thinks it strange that the opportunities Esmeralda offers are not more generally taken advantage of.

Water Terms.

As there does not appear to be a clear understanding by most people of many of the terms used in connection with irrigation, the following, by Charles L. Stevenson, hydraulic engineer, defining the meaning of such expressions and giving the comparative values, is useful.

Irrigation water is measured generally by the cubic foot, by the gallon or by miners' inches. The "duty of water" means the area of land upon which a definite volume of water, applied during a given period, will successfully raise crops. Thus, the average duty in Utah of one cubic foot per second during a period of 120 days is 100 acres. One cubic foot per second is a "second foot." The "acre foot" is the equivalent of one acre covered one foot deep, or 43,560 cubic feet. The miners' inch is a variable quantity, depending upon the head above the one-inch orifice of discharge. It varies from

a four-inch head to a six-inch head, and is not a commendable unit of measure. Thus, there are fifty miners' inches to a cubic foot per second, California measurement, and about forty miners' inches, Colorado measurement. One cubic foot contains 7 1/2 United States gallons of 231 inches.

Cubic feet.—1 cubic foot per second equals 2 acre feet in 24 hours, 60 acre feet in 30 days, 180 acre feet in 3 months, 720 acre feet in 1 year, 7.5 gallons per second, 449 gallons per minute, 50 California inches, 38.4 Colorado inches.

California Inches.—100 California inches equals 4 acre feet in 24 hours, 1 acre foot in 6 hours, 120 acre feet in 30 days, 360 acre feet in 3 months, 1440 acre feet in 1 year, 15 gallons per second, 900 gallons per minute, 77 Colorado inches, 2 cubic feet per second.

Colorado Inches.—100 Colorado inches equals 5 1/2 acre feet in 24 hours, 1 acre foot in 4.2 hours, 155 acre feet in 1 month, 465 acre feet in 3 months, 1860 acre feet in 1 year, 19.50 gallons per second, 1170 gallons a minute, 2.6 cubic feet per second, 130 California inches.

Supreme Court Decision on Water Rights.

The Supreme Court has decided the case of Ely against Ferguson, in which the question of the right to appropriate water flowing from springs was involved.

The plaintiff, Benjamin Ely, sued Louisa Ferguson to obtain a perpetual injunction restraining her from obstructing the flow of water into a ditch constructed to convey the water into his land for domestic and irrigation purposes. The injunction was granted and the defendant appealed. The ditch was constructed in 1862 by a man named Jamison, and extended from the land of the plaintiff to that of the defendant. The lands referred to are in Lake county, and was then public land of the United States.

On the land now owned by the defendant there was a marsh of about four acres and on one side of it there were hills, near the base of which several springs flowed, carrying in the aggregate during the summer and fall months about 24 inches of water, measured under a four-inch pressure. These waters flowed into the marsh, and thence through a natural channel to and across the plaintiff's land on points higher than they would otherwise have reached.

In 1867, Jamison posted and had recorded a notice that he claimed for purposes of irrigation, all the water flowing from the different springs. In 1870, he sold his possession claim to the land now owned by defendant, and one-half of the water appropriated by him, to one Chambers, and reserved by his deed the other half of the water for use on the land now owned by the plaintiff, where he then lived. In 1872 he posted and caused to be recorded another notice of appropriation, in which he claimed one-half of the water flowing from the different springs, amounting to 12 inches under a four-inch pressure and the ditch already constructed.

Chambers sold his claim to R. R. Ferguson, the defendant's predecessor in interest, who obtained a U. S. patent for the land, subject to vested and water rights for mining, agricultural and other purposes. Jamison lived on the land now owned by the plaintiff and used the water until 1872, when he conveyed the land with its appurtenances to one White who obtained a patent therefor. White conveyed the land to one Getz, who conveyed it and all its appurtenances to the plaintiff in 1883. Each of these grantors and the plaintiff claimed and used one-half of the water flowing from the springs until 1887, when the defendant obstructed the ditch.

Two points were made for a reversal of the judgment. It was claimed that water flowing from springs could not be appropriated, and seemed that if Jamison did acquire a right to the use of the water of the springs and marsh, the land to which he conducted it was then unsurveyed public land to which he had no semblance of title, and hence the water right did not become appurtenant to the land, and could not be passed to another except by deed.

The Supreme Court held that neither of these claims could be upheld. Water flowing from springs, as this water did, may be appropriated, and the land to which the water was taken by Jamison did not prevent the water from becoming appurtenant thereto. For these reasons the judgment of the lower court was affirmed.

Jamison was a rightful occupant, as all public lands are open to occupation and settlement by citizens of the United States, and from the earliest times in this State it has been customary to divert water to public lands for mining, agricultural and other purposes, and this right was in 1866 confirmed and approved by Act of Congress. The Civil Code also makes provision fitting the case in Sec. 662.

The big engines of the Los Angeles Electric Railway Company's new power-house were started up for regular business September 16th, the inauguration having been delayed a couple of days. The great dynamo, of 250-horse power, was set going to generate the electricity required for propelling the cars now running on the line.

The new shaft engine was put in place at the Con Virginia mine Saturday, and a full force of miners set to work on the different levels. So says the Virginia Enterprise.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

AMADOR GOLD MINE.—*Ledger*, Sept. 26: There is no change to report in the condition of affairs at this mine. It has been tied up by attachments for over a year and there seems little prospect of a speedy settlement of the legal difficulties in which it is involved. There were some rumors circulated some time ago that an effort would be made by the English company to settle with the creditors at so much on the dollar. No proposition of the kind, however, has been made to the creditors around Jackson. The keeper, N. Millosovich, remains in charge of the property for the sheriff, and J. E. Dye continues at the mine as the representative of the English stockholders.

KEYSTONE.—This old mine—the longest-lived mining property in Amador county, if not in the State—has levied its first assessment of \$2.50 per share. The cause for this demand for money is the great improvements which are made about the mine, including the addition of an air compressor. Only a portion of the mill has been running for months, and on low-grade rock at that, and the output of bullion has not kept pace with the expenses. We understand there are only 10,000 shares in the company, all in the hands of a few individuals, so that the assessments will realize \$25,000. The outlook of the mine, however, promises fair for the inauguration of a new dividend-paying era in the near future.

MISCELLANEOUS.—Messrs. Mello and Arata have entered into an agreement to bond their mining claim at Jackson Gate to San Francisco parties for \$20,000. The bond is to be executed early next month. The two-stamp mill is running under the management of the owners. A cleanup was made last week, but we are unable to state the exact yield, although it is claimed to be satisfactory.

Butte.

QUARTZ MINING IN BUTTE.—*Oroville Register*, Sept. 26: This country has long been rich in quartz mines but the outlook for extensive quartz mining is now brighter than ever before. D. K. Perkins is opening a mine near Gravel Range. C. G. Ferguson is opening one near Enterprise; the Shakespear ledge is being developed and a mill will be built upon it shortly. The Stow mill is being enlarged. The mill on the Golden Queen will be increased in working capacity. The Lumpkin Co. is developing a fine property that promises to be rich and a mill will sooner or later be built. The Palo Alto Co. will have ten more stamps running in a few weeks. Rich rock has been struck by Messrs. Gray and Chivels near Hurleton. The mines under Major Reynolds near Merrimac Mills are paying finely while from every quarry comes cheering news of rich ore, new developments, increased milling capacity, or new mills or arrastras being put up. The improved facilities for working refractory or low-grade ores have given a wonderful stimulus to quartz mining in Butte and to-day that branch of our industries wears a brighter and more encouraging look than ever before in the history of the State.

ENTERPRISE.—From Mr. C. G. Ferguson of the Enterprise Mine Co. we obtain some facts concerning the mining operations on McCabe creek. Mr. Ferguson is superintendent of the mine there and tells us that two arrastras to be run by water power are being put in. Owing to the absence of any road the machinery is hauled to the top of the hill and then let down the deep inclination with ropes and pulleys. The arrastras will be run with water from McCabe creek and it is estimated that from four to six tons a day can be ground by each one. A Dodge rock breaker has been put in which prepares the rock for the arrastras. There are two veins, one about two and a half feet wide and the other fully 12 feet in width. There are three tunnels, one 100 feet long, a second 180 feet and a third 300 feet. This last one will strike the ledge fully 400 feet below the surface giving an enormous amount of rock, and Mr. Ferguson estimates that they have developed ore enough to last a 10-stamp mill for ten years. As soon as the rock is sufficiently tested a 10-stamp mill will be put up and this will be run by water power already named. Most of the stock of this company is owned in Chicago and it is the intention of the company to fully develop the mine before putting expensive machinery upon it. There is an abundance of timber for timbering the mine and other purposes and the water power affords a cheap method of running the arrastras and the mill.

THE GRAVEL CEMENT in the bottom of the Spring Valley mine at Cherokee after having been thoroughly cleaned of its gold by the company has been leased to other parties. They have been at work for some months past and have paid little more than expenses. Lately they have put in some new machinery for grinding or crushing this cement and the last run paid them well. There is enough of this cemented gravel to last for ten years' work.

HUNTING THE BLUE LEAD.—*Palermo Progress*, Sept. 26: G. Moore has gone over to the Honcut near Bangor where he will superintend the sinking of a shaft on a mining claim belonging to Streeter and Boulware, the big sheep raisers. Mr. Moore hopes to encounter the famous Blue Gravel Lead which has proved such a source of wealth to those who have been fortunate enough to own mines in the vicinity. If the claim gives indications of panning out well the owners will at once erect a mill for crushing the ore. Messrs. Streeter and Boulware are two wealthy farmers residing near Biggs. They have abundant means to prospect and work this mine. This town is interested in the success of Messrs. Streeter and Boulware as this place will be the shipping and trading point, as the mine is near here.

Colusa.

OIL WORKS.—*Williams Farmer*, Sept. 26: J. P. Rathbun informs us that he and his brother have effected the lease of the petroleum mine, that he discovered on Sulphur creek last winter, to the Union Oil Co. of California for a term of fifty years. The agent of the company was in Williams and left for San Francisco the same day, so we did not get a chance to interview him concerning the intentions of the company he represented, but from information furnished us by Mr. Rathbun, he seemed to

have great confidence in the ultimate result of the financial success of the company's lease and predicted for the mine a brilliant future. The intentions of the company are to erect works that are to cost \$1,000, within the year. If these oil springs come up to the expectations of the parties interested we may expect considerable benefit to accrue to Williams therefrom.

El Dorado.

JONES' HILL.—*Georgetown Gazette*, Sept. 24: The Hard Struggle Mining Co. have struck good prospects and are busy opening the old Orleans tunnel, which was run 40 years ago. Mr. Bentley is hauling timbers for his gravel mine, where he intends to begin work soon.

Inyo.

PROSPECTS GOOD FOR A LIVELY CAMP.—*Inyo Independent*, Sept. 26: It is highly probable that a rich mining property will be developed at Pine Mountain. S. P. Roberts has been located in that country for many years past and had located quite a number of claims. He is a poor man and unable to develop the property himself, but his faith that the mines would ultimately be developed was great, and he pluckily hung on. Some time ago Andrew Fyfe inspected the country, and the result was that he has bought Roberts' interest in the group with the exception of one mine, which the latter reserved. A good wagon-road has been completed up Black Canyon and a small mill erected at the mines. Dick Whittaker, who came in from there last Sunday, says the stamps will commence dropping tomorrow. D. J. Hessian is interested with Mr. Fyfe and has a team engaged in freighting. A carload of ore was shipped during the week. Some two years ago, at the invitation of Mr. Roberts, the editor of this paper visited the Pine Mountain country, and predicted that some day a good-paying camp would be located there.

FISH SPRINGS.—*Inyo Index* Sept. 26: Jack Welch's recent efforts in working by arrastra process the highly sulphuretted but rich gold ores of the old Fish Springs District were decidedly successful. He will continue work during the winter, there being no longer a doubt as to the "paying proposition" business.

MAZOURKA.—Oscar Stickney will do a lot more development work on his claim above and west of Badger Flat. Uncle Joe Groves has begun work on his mine near the forks of the canyon. This is one of the oldest locations in Union District, showing a broken body of silver lead ore that only requires close sorting or else a concentrating plant.

Nevada.

THE CENTENNIAL MINE.—*Grass Valley Telegraph*, Sept. 25: Supt. A. W. Stoddard is getting things in shape at the Centennial mine. The plant is about as good as any around here, being just large enough for the work required and having nothing cumbersome about it. The buildings are all up, the pumping engine is in place, and it will be but a few days when the hoisting engine will be ready to run. The collar of the shaft has been cleaned out and retimbered, and in about 15 days a force of men will be put to work on the Centennial. The present shaft at the mine is down to a depth of 600 feet, and the machinery is fully capable of working to a depth of 1000 feet.

Placer.

THE THREE STARS MINE.—*Herald*, Sept. 26: Mr. Wm. Werry, who has been engaged under B. F. Hartley in pumping out the Three Stars mine, was in town the early part of the week, and he informs us that the water is now being pumped from the lower level, which is 400 feet deep. He thinks this level will be drained free of water in a few days, after which he expects to commence sinking and drifting on the 400-foot level. Mr. Werry seems to think well of the mine and its future working. So far as can be seen, the vein is strong, being 2½ feet thick, with 20 to 25 dollar ore. The mine has a good record, but present appearances indicate that everything has been taken out to a depth of 400 feet on this chute of ore and milled. This vein can be traced on its outcroppings for miles in length, and there is no question about its being a true fissure vein or lode. Mr. Werry thinks it is the same vein as the Zentgraf mine, in El Dorado county. He thinks the future working will prove it to be a handsome paying property, and that Mr. Hartley has a better mine than he is aware of. This is certain, there is hardly a mine in the State that has yielded more gold at the same depth than the Three Stars. In predicting good future results, Mr. Werry ought to know what he is talking about, as he has had 20 years' experience in mines and mining in this locality, and has been, on the whole, as successful as any of them.

San Bernardino.

MINING GROUND LEASED.—*San Bernardino Times-Index*, Sept. 25: Mr. I. H. Crossman, the former superintendent of the Gavilan gold mine on the San Jacinto estate (limited), has acquired a ten years' lease of 4000 acres of land upon which the mines are located, and has commenced the organization of a stock company for the purpose of working the same. When the company is formed, work will be commenced on the mines. These mines were worked years ago by Mexicans, and large sums of money were mined there, and it is thought that with experience and new and improved machinery, more large fortunes may be made.

San Diego.

RICH AND MORE.—*Julian Sentinel*, Sept. 24: The phenomenal era of luck and prosperity that has followed our mines of late bids fair to continue until every mine in the camp has a treasure find to record. The first big strike brought to our notice since the magnificent ledge was cut in the Helvetia is from the Ruby which came to the front on Saturday last with a 16-inch vein of beautiful rock. Some of the specimens exhibited are actually encrusted with the bright yellow metal. The managers of the Ruby Company have been following good ore for some time, but the exceedingly rich rock now coming from their lower tunnel surpasses their expectations. Al Frary has been taking out good rock of late from the Eagle. We learn that the Kentuck S is soon to be started up under the management of a well organized company. This is a fine property, and had it not become involved in legal complications which compelled work upon it to be abandoned, we believe a great deal of money would now be coming from it. The High Peak has been temporarily shut down. The owner, Mr. Havermale, having for the time centered his forces and attention

upon the Helvetia. Before the High Peak is again operated, it is probable that machinery will be put in to handle the water more expeditiously. Visitors at Banner the past week have been forced to remark upon the activity presented there. The big mill of the Gold King Company has been kept company by the Kerr mill, and between the two, considerable rock has been crushed. James Courtney and Mike Flatley are at work on the Padlock mine. If they can fit the right key, they will surely unlock the treasure of the hills. Work on the now famous Helvetia is still progressing. We are informed that the men are now 40 feet from the point of first contact with the rich lead, and the character of the ore taken out is as good as the first strike. This find is great—it is immense. It is not excelled in quality or quantity by any mine in Southern California.

Shasta.

FROM IGO.—*Cor. Shasta Courier*, Sept. 26: J. P. Wright and sons are down 30 feet with the shaft on their newly discovered silver ledge. It is located just off the South Chicago grounds, and has been run over for years, a house being built close by in years past, the men passing over the ledge in going to and from work on an adjacent location. The ledge is now four feet, a foot of which nets \$100 per ton, shipped below. Two shifts are now at work sinking, the intention being to drift at 60 feet. D. Bull is working on a small vein on the grade between his house and Robinson's. The vein has been exposed for 20 years or more, the county road cutting it. Though small, the ore is nearly all pay, and nets \$11 per sack. A shipment has been made from the Crystal, the returns from which have not been received at this date. There is no doubt about the ore being good. The crosscut for the main ledge is more than half completed. Robinson & Son have found a vein of high-grade ore on or near their Black Prince. The ore is said to go over 1000 ounces per ton. A tunnel is being run to strike it some distance from the surface. Report has it that the Eubanks boys have also found a good ledge of silver ore. Jones of Muletown has one of his patent arrastras set up at Robinson's, and is running some ore from Streeter's ledge. The arrastra is about two feet in diameter, with 2½ tons' capacity. Shirland's arrastra is running on ore from the Creighton ledge. E. L. Ballou is running his arrastra on Manzanita ore. Litten and Moody have their arrastra rebuilt, and are grinding Continental ore. A good many of the ledges here are small, but no one has yet found the bottom of one, or been able to dig out all the ore.

Sierra.

SIERRA CITY.—*Cor. Mt. Messenger*, Sept. 26: Times are seemingly rather dull just now hereabouts, but the prospect is very bright of an early revival in mining interests and a change for the better, when more mills are crushing the gold from the partially developed rich ledges in this auriferous mineral belt—the most extensive in this county. Raise from No. 4 to 3 tunnel, at the Young America quartz mine, progresses satisfactorily—up 250 feet last week. New Phoenix mill will be completed to crush ore by Oct. 15th. A. C. Busch, owner of this valuable property, is very much pleased with the certainty of handsome dividends the snow flies. Encouraging prospects are being obtained from adjacent quartz mines that may soon afford work for more men.

MOUNTAINEER.—*Mt. Messenger*, Sept. 26: We understand that the affairs of the Mountaineer mine have been straightened out since the arrival of Mr. Winter, and work will be renewed at an early day.

Slaskiyou

GRAVEL.—*Yreka Journal*, Sept. 26: Lee, Lash & Co., have finished their shaft to sufficient depth for drainage and are now drifting toward the pay gravel which they expect to reach soon, and commence getting out gold again. Myron Carrick has found a very rich ledge of decomposed quartz on Greenhorn, next above the Hookthorn & Clark ledge, and is now busily engaged in opening it, so as to develop its extent. The workers in the Spencer mine, at Humburg, are sinking down deeper in developing the ledge and getting ready for winter operations in taking out quartz. Considerable quartz will probably be crushed before the winter storms commence, as the mill is now kept running constantly. The shaft in the Yreka Blue Gravel claim is down about 108 feet from the surface, with an improved appearance of the gravel, now yielding some gold, an indication of nearing bedrock, where it is anticipated the gravel will pay handsomely. F. Franklin, of Greenhorn, has found an exceedingly rich body of quartz on the north fork of Greenhorn, which if proving extensive, will be one of the richest quartz claims yet discovered in this county. Mr. Franklin has been prospecting for many years on Greenhorn, and understands mining very thoroughly. This new find is in the vicinity of the claims of Ira Worden, Heckathorn & Clark and others, in which good prospects have also been found. The Chinese working the Bentz Bar claim, near Honolulu, at Klamath river, are reported to be taking out immense quantities of gold dust from bottoming up the cuts opened in the old river channel. Rumor says they lately realized \$21,000 in three days run, but we are unable to confirm this report, as the Chinese are mum, except in admitting that the claim is now paying. This company works a large force day and night, and the claim is in a good locality for rich pay, judging from the extensive yield of the old Kanaka claim in the same vicinity, some years ago. The Phil Mott claim, below Honolulu, on Klamath river, is also said to pay well, ranging from 50 to 100 ounces a week in bottoming cuts at bedrock. The Beebe Bar claim, owned and kept in operation by J. S. Cleland, our well known and enterprising Yreka merchant, paid between \$600 and \$700 in one day's clean up last week, with prospects of better yield in uncovering bedrock as the work is continued up stream. An immense amount of gold is coming to Yreka from the Klamath river placer mines and the Humburg creek quartz mines, the persons bringing it taking great care to avoid being waylaid. It is brought here in various ways to avoid suspicion, and notwithstanding the great amount of bullion transported every year from the sections above named, we have never yet heard of any highwaymen molesting the parties carrying the gold.

Tuolumna.

THE BADGER MINE.—*Independent*, Sept. 26: Geo. Stayton and others have instituted proceedings to dispose of John Sevenoaks from any possession he might claim in the Badger mine. The Badger mine,

the property of W. G. Martin and Henry Yancey, was bonded some time ago to Gilroy capitalists, represented by Geo. Stayton, for \$8000. Subsequently the mine was re-bonded by the Gilroy company to W. H. Martin and John Ballard of San Francisco, for \$25,000. John Sevenoaks was sent up to superintend the development of the mine, with the agreement that he should have a tenth interest in the profits of the mine. Operations were commenced and continued about two months, incurring an indebtedness of about \$5000. The mine proved satisfactory, but not so Superintendent Sevenoaks. A short time ago, W. H. Martin came up from the city, suspended operations on the mine and shut it down. He also discharged the superintendent and paid all the bills; but notwithstanding all this, Sevenoaks continued in possession, still working the mine and ignoring every one else, claiming that he would continue to operate the mine, but this story did not satisfy the interested ones, who have brought suit to oust him.

NEVADA.

Washoe District.

CON. CAL. AND VA. MINE.—*Virginia Chronicle*, Sept. 26: 11000—Have continued retimbering south drift. In the crosscut running east from the shaft station have been easing timbers and making necessary repairs. At a point in the south drift, 100 feet from the south station, a west crosscut has been started and advanced 8 feet. Have continued to extract some ore from the openings on the 1300 and 1600 levels. 1750 level—In working out and upward from the bottom of winze No. 2, sunk from the 1650 level, we continue to extract ore of fair quality. At a point from the west crosscut 60 feet in the upraise has been carried up 23 feet in porphyry and vein matter of low assay value. From the crosscut running east from the winze No. 1, at a point 50 feet below the sill floor of this level, at a point 85 feet east from the winze, a north drift has been started and advanced 15 feet in quartz formation of low assay value. The northeast drift started last week in a narrow streak of ore, at a point 185 feet in from the winze, has been advanced 17 feet and work suspended. The streak is still showing in the top portion of the face. There has been extracting from all parts of the mine during the week 978-1280 2000 tons of ore, which was shipped to the Morgan mill. The average assay value of all of the ore worked at that mill during the week (980 tons) was \$9.45 per ton. Bullion shipped to Carson Mint; assay value about \$25,000.

OPHIR.—1465 level—We have continued our prospecting work from the openings in the vicinity of the point where the upraise from the sill floor of this level connected with the drift run west from the winze 122 feet below the sill floor of the 1300 level.

MEXICAN.—On the 1465 level the south drift started from the east crosscut No. 1, at a point 618 feet in from the main north lateral drift, has been advanced 25 feet; total length, 319 feet; and continues in a hard porphyry formation.

UNION CON.—From the east crosscut No. 2 on the 1465 level, at a point 1070 feet in from the main north lateral drift, the north drift No. 2 has been advanced 24 feet; total length, 95 feet in vein porphyry, which carries a low assay value.

CHOLLAR.—The east crosscut on the south line, 1200 level, is out 30 feet; face in porphyry. The south lateral drift from the incline station, 1500-foot level, is out 104 feet; face in porphyry. Extracted and sent to the mill during the past week 416 tons of ore; average battery assays, \$15.66.

POTOSI.—The east crosscut on north line, 1200 level, is out 30 feet, face in porphyry. South drift from winze station, 1400 level, is out 74 feet; face in porphyry. The north drift, same level, is out 73 feet; face in porphyry and streaks of quartz yielding low assays.

NORTH GOULD & CURRY AND EAST BEST & BELCHER.—We are progressing rapidly in handling the water. We are now below the upper drift and will continue on the lower one, which we expect to reach in a few days.

ANDES.—On the 420 level, main north drift was advanced 20 feet; formation clay and porphyry. East crosscut No. 4 from north drift extended 19 feet, continuing in quartz, yielding low assays.

SIERRA NEVADA.—West crosscut No. 1 from the northwest drift, 630 level, 571 feet from the shaft, has been advanced 46 feet; total distance, 1049 feet; formation, quartzite with small streaks of quartz of low assay value. The Kenosha tunnel has been advanced 30 feet; total length, 928 feet; face in hard porphyry.

CON. NEW YORK.—The west crosscut, 230 feet north of shaft, 650 level, is out 67 feet. It has passed through 8 feet of quartz, some of which yields fair assays. The east crosscut, 600 feet north of shaft, 1100 level, is out 33 feet. It has passed through 28 feet of low-grade quartz.

UNION SHAFT.—The west drift from the shaft, 900 level, has been advanced during the past week 24 feet; total distance west of shaft, 1104 feet; face in porphyry with considerable water.

EXCHEQUER.—Are still retimbering the shaft. The joint southwest drift from the 1800 level, Ward shaft, is out 402 feet; face in hard porphyry.

SILVER HILL.—The northwest drift, 50 level, is out from the shaft 270 feet; the face is in porphyry. The south crosscut, 160 level, is out from the winze 720 feet; face in hard porphyry.

UTAH.—The southeast drift, 725 level, has been extended 38 feet, total length 375 feet, continuing in porphyry showing a little clay.

OCCIDENTAL.—Have extracted and sent to the mill from all parts of the mine 905 tons of ore of the average value of \$16.20 per ton, as per battery samples. The upraise from the 650 level is up 27 feet, top showing \$16 ore. Have started an east crosscut from the end of the south drift on 725 level. It is now in eight feet in quartz, showing little value.

BULLION.—The joint east crosscut on the north line, 1300 level, is out 120 feet; face in clay and porphyry. The joint south lateral drift from the Potosi winze station, 1400 level, is out 74 feet; face in porphyry. The joint southwest drift from the Ward shaft, 7800 level, is out 402 feet; face in porphyry.

Robinson District.

ACTIVE.—*Eureka Sentinel*, Sept. 26: From Mr. Cupid, Auditor and Recorder of White Pine county, who is at present visiting Eureka on mining matters, we learn that considerable activity prevails in Robinson district. Mr. Watson is working six men un-

der the charge of Gum Peters, and every stroke of the pick continues to show up its great wealth. A well-defined streak of \$30 gold ore has recently been developed in the southeastern portion of that mine, where formerly little of value was thought to exist. The Florida, Joanna No. 2, Rob Roy, Chairman and a number of other good mines in the district exhibit additional value as development is made. Mr. Cupid is confident that Robinson is destined to become the Comstock of the Great East, so soon as the suicidal litigation is ended, which has up to this time retarded its great worth. He says the Chairman mine alone is admitted to have more than \$150,000 of gold ore in sight.

Eureka District.

CLEANUP.—Eureka Sentinel, Sept. 26: The Eureka Con. Company made a cleanup of ore at their mine last Saturday, which was intended to be the last to be worked at present at their furnaces. It pays the company to ship their low-grade iron and lead ores to Salt Lake.

LAID OFF.—A number of miners having been laid off in the Richmond, Eureka Con. and Williamsburg mines, has caused some of them to look for "pitches" in other localities.

Pine Nut District.

RICH ROCK.—Eureka Sentinel, Sept. 26: It is reported that Z. R. and Schultz have resumed work on their mine at Pine Nut, and are taking out the same immensely rich rock. Men have been put to work in other parts of the camp.

OREGON.

A BIG INSTITUTE.—Eugene Register, Sept. 26: The Myrtle Creek Mining Company is of more benefit to Eugene than many people imagine. One hundred and sixty men are now employed at the mine, and most of them were sent out from Eugene. The pay-roll is about \$5000 per month. In addition to this, the men are fed by the company, and \$1000 or over are paid out every month for food and supplies, nearly all of which is shipped from Eugene. About four miles of ditch remain to be dug before the head waters of the Umpqua will be tapped, and this will probably be completed next month.

THE WILLOW CREEK MINES.—Heppner Gazette, Sept. 26: In conversation with Mr. Scott, who is developing the Little Laura at the head of Willow creek, we learn that work is progressing quite rapidly, and that some time next spring they will tap the main ledge, which as rich as croppings suggest, will prove a bonanza. There is but little being said about this district, but blowing doesn't always make mines.

MORROW'S OPAL MINES.—It was our pleasure last week to see some beautiful opals from the Hoskins-Hadley claim. They were taken from the g-bone formation, and present a most attractive appearance. Mr. Hoskins informs us that they have thoroughly developed their claim and have every reason to believe that they have a good thing. Morrow county's opal mines are attracting considerable attention from every quarter.

WASHINGTON.

TO HYDRAULIC.—Seattle Press-Times, Sept. 23: Miners and sportsmen are likely to engage in a spirited legal contest next season. The hydraulic process will be used in the placer mines along the Sultan, Swank and Ruby creeks. Hydraulic mining means death to the fish that are below in the stream and it is thought that some of the numerous rod and gun clubs will ask the Fish Commissioner to interfere. It is also feared that the State Legislature may interfere with the use of the hydraulic process. The Ruby, Swank and Sultan could hardly be classed as navigable streams. Miners say that state legislation against the hydraulic process would be a great injustice, as the reasons which caused the law to be passed in California do not exist here. The Washington streams have high banks, and there is very little farming land lying along the banks. Some placer diggings, which it does not pay to work by the old sluice process, pay large dividends when operated by the hydraulic process, and the justice of the California State law is severely criticised by mining men. The fact that hostile legislation is feared is said to be the reason that a company, alleged to be composed of Boston men, has not given any publicity to the fact that it will put in a number of hydraulic machines on the Swank, Ruby and Sultan. The name of this company is not known, but owners of placer mines along these creeks have been heard to declare that the sluice would be abandoned next season for the hydraulic process. There is but little doubt but that the hydraulic process will pay along these streams, as at present, many miners are earning fair wages by the use of the sluice. It is said, however, that if operations are interrupted by legislation or the Fish Commissioners, it will be a very unprofitable investment, as hydraulic process is very expensive, and if its use is prohibited in this State, there will be no place where the machinery can be used, as the placer fields of British Columbia, as a rule, do not require its use.

PORTLAND EXPOSITION.—Mr. G. W. Ingalls, of Portland, Oregon, has been for some weeks in charge of the mineral and natural history department of the Oregon Immigration Board and the Industrial Exposition, and has been east of the Cascades for some time engaged in the work. He writes us from Portland that the crowds at the Exposition are increasing daily. The general opinion is that the exhibits are the best ever seen in Portland.

AFTER paying all bills for August account, the Consolidated California and Virginia Mining Company had a surplus of \$126,000, against about \$150,000 after paying the previous month's expenses. The decrease was caused by the small haulage product of the mines and the fact that the company had to pay the quarterly haulage tax, amounting to \$10,500.

THE ARIZONA UNIVERSITY opened this week. The School of Mines and the Agricultural College opened at the same time with the same faculty. Professor A. A. Guiley is Dean and Dr. Theodore B. Comstock, Director of the School of Mines.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING, Sept. 22, 1891.

- 459,885.—AUXILIARY SAFETY SPRING.—Wm. M. Betts, S. F.
- 459,923.—NETTED WIRE FABRIC MACHINE.—T. M. Conner, Los Angeles, Cal.
- 459,887.—HARNES.—H. G. Cox, Alvarado, Cal.
- 459,837.—PIANO-MUTE.—Frederick and Gelsler, Portland, Or.
- 459,751.—COMPOUND FOR SHIPS' BOTTOMS, ETC.—B. Hooker, San Diego, Cal.
- 460,020.—PLOW.—C. W. Larsen, Medical Lake, Wash.
- 459,917.—CONTACT FOR ELECTRIC PROGRAMME CLOCKS.—F. E. Smith, San Jose, Cal.
- 459,885.—ENGINE.—Thibault & Harsin, Stockton, Cal.

The following brief list by telegraph, for Sept. 21, will appear more complete on receipt of mail advices: California.—Walter B. Hildner, water motor; Matthias Melittzer, hat-pressing machine; Carl L. Schallitz, still; James M. Dyer, wave-power; Richard Wheeler, insecticide; Gustav Gunnarson, three-griped self-adjusting pipe wrench; Samuel N. Goldy, wood-turning lathe; Clayton P. Smith, pump—all of the above being of San Francisco. Ellsworth D. Middlekauff, Stockton electric grinder; Henry Kohrer, Stockton, vehicle wheel; W. Conrad and J. H. Lake, Hanford, windmill; Wm. W. McGregory, Pasadena, reamer; Jerry Cook, Monterey, building blocks; Wm. J. Burke, Seattle, r. steeling light; Moses Laussen, Goldendale, Wash., car coupling.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

AUXILIARY SAFETY-SPRING.—Wm. M. Betts, S. F. No. 459,886. Dated Sept. 22, 1891. This auxiliary safety-spring consists essentially in a supplemental spring to be used in connection with vehicle springs to prevent damage to the latter from overloading. The safety-spring is placed on the upper side of the lower half of the ordinary elliptic carriage spring. It is made straight or slightly concave on the top and has curved ends so that it returns upon itself, the curvature of the ends forming an arc. The inner ends of the spring are curved to the segment of a circle, so that the upper ends of these segments, which are near together, will stand a short distance beneath the upper surface of this supplemental spring. On the under side of the upper half of the elliptic spring is a block or bumper, which, when the main springs are overloaded, comes down and meets the auxiliary safety-spring, preventing the two pairs of the main spring from being closed any nearer together.

HARNES.—Harris G. Cox, Alvarado, Alameda Co. No. 459,887. Dated Sept. 22, 1891. In the ordinary construction of driving harness, a collar or breast-plate is employed, to which the traces are connected, and both of these devices are objectionable because they interfere with the free movement of the horse's shoulders. This is especially the case in track-work, where it is desirable to give the horse the freest possible movement in order to increase the stride and the speed at which he can travel. In this invention both these devices are dispensed with and the horse's shoulders and front part of his body are left entirely unimpeded.

ENGINE.—Henry Thibault and Chas. D. Harsin, Stockton, assignors of part to John Gambetta, same place. No. 459,885. Dated Sept. 22, 1891. This invention relates to certain improvements in engines to be propelled by steam, air, vapor or any other elastic or suitable medium. It consists in the arrangement of two or more cylinders within a rotating rim and radial to the center thereof, pistons reciprocating in said cylinders, and connecting rods uniting said pistons with a stationary pin, which is eccentric to the center of the rim to which the cylinders are fixed.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Oct. 1, 1891.

General trade continues to improve. Merchants are said to be getting into better position, financially, than for several years. Among iron-workers continued activity in all branches is reported. Some report too much work. The money market is easy. The many who claimed that tax-collecting would be severely felt, now say that it will hardly create a ripple, for tax-payers are prepared to meet the payments.

MEXICAN DOLLARS.—The market is quiet at around 77 cts.

QUICKSILVER.—There is a fair call, with sales made at quotations. Receipts, the past week aggregate 103 flasks.

SILVER.—With the surplus stock in this country being reduced to very small proportions, and the output of the mines not meeting current requirements and the market going down, it is something of a puzzle even to those who try to keep well-informed on silver. India continues to draw heavily from England, yet the effect is, as yet, transient. Probably the present condition of the market is largely due to the desire of European Governments to secure all the gold that can be had without a too great disturbance in the money centers. To this can be reasonably added, as an unfavorable influence, the feeling of unrest and feverish uncertainty which pervades, at present, all classes in Europe. To an outsider, it looks as if European nations stood over a powder magazine which, at any time, is liable to be set off by a stray spark. Times abroad are very critical, and until more amicable feelings are cultivated, a general war is likely to be brought about by imprudent or incautious remarks or acts from those in authority. Yet when nations are prepared for war, it seldom comes.

BORAX.—The market is steady with continued free shipments to the East.

LIME.—Receipts the past week aggregate 3739 bbls. Notwithstanding that the low price of imported cement has lessened the use of lime in building work, there is a free demand at current quotations.

TIN.—The market is essentially unchanged for both plate and pig. Receipts the past week aggregate 700 boxes, overland, during the past week. A cablegram under date of London of Sept. 23: "Pig tin prices improved under the influence of Straits shipments being smaller than expected. The latter circumstance prompted some buying for 'loog' as well as covering of 'short' sales. The consumption continues good. During the past few days speculation has fallen off in the absence of encouragement from the leading operators." The Iron Age reports the New York market quiet but steady under firm holding.

COPPER.—The market is steady at unchanged quotations. New York mail advices report as follows: Home consumers are consuming more copper at present than at any previous time this year, the late break in prices for manufactured copper and brass having drawn in numerous orders from various sections. Export movement has served to cut surplus stocks considerably, also leaving producers well in control. Arizona ingot, of which there is only a moderate supply available, is quoted at 12c to 12 1/2c. Casting bars remain at 11 1/2c to 11 3/4c, without movement of important volume the past week. The official report of the Bureau of Statistics gives the following data of exports from the United States during the seven months ending July 31:

Ore, tons	1891.	1890.
Ingot, bars and old, pounds.....	39,724,311	7,312,648

IRON.—Imports the past week aggregate 100 tons from New York. Large buying orders can be placed at concessions on asking rates. The consumption is steadily increasing.

LEAD.—The market continues to maintain a firm tone in sympathy with the East, where a freer movement is reported. The demand is said to be legitimate business.

COAL.—Imports the past week aggregate as follows: From Tacoma, 10,150 tons; Liverpool, 2310; Sydney, 1635; Swansea, 2200; Newcastle, N. S. W., 1906; Seattle, 4400; Tacoma, 7000. Total, 29,341 tons. The market for spot and nearby foreign cargoes is barely steady, but for shipment it is firm with ships disposed to ask more freight. The large tonnage on the way to this port for wheat loading has caused outward charters to recede which naturally reacts against cheap coal freights. The imports of coast coals the past week were very heavy, with free shipments on the way.

Eastern Metal Markets.

By Telegraph.

New York, October 1.—The following are the closing prices the past week:

Silver in London.	New York.	Copper.	Lead.	Tin.
Thursday @	97 1/2	12 40	4 52 1/2	90 10
Friday @	97 1/2	12 35	4 52 1/2	20 10
Saturday @	98	12 35	4 55	20 10
Monday @	97 1/2	12 35	4 55	20 10
Tuesday @	97 1/2	12 35	4 52 1/2	20 00
Wednesday @	97 1/2	12 25	4 50	20 00

Quicksilver is very strong. Borax is steady and firm. Lead is firmly held. Copper has weakened slightly. Tin is in moderate demand.

DUTY ON FOREIGN BOOKS.—The Treasury Department, in reply to a letter of inquiry from J. O. Powell, librarian of the University of California at Berkeley, decides that the importation of notable books by mail is prohibited by article two of the universal postal union convention; but as books imported—not more than two copies in any one lot—in good faith, for the use of any society incorporated for philosophical, literary or religious purposes, or for the encouragement of the fine arts, or for the honor by order of any college, academy, school or seminary of learning in the United States, are exempt from duty, such prohibition does not apply to them.

Mining Share Market.

Mining shares the past week, were very dull and heavy, necessitating the pool to cross-orders so as to make lower quotations, and draw in actual sellers. The market, if it can be dignified by the name, has every appearance of a genuine freeze out of the limited few who still hold stocks. Persons who are supposed to be close to the inside have repeatedly stated that before a big market, the public would have little or no stock. If their assertions were authorized, then we ought reasonably to look for a big market being near at hand, for never within the history of the Comstock mines, has the public held so few stocks as they do at the present time. Commission brokers hold very few on a margin, while hundreds of persons who formerly held lines of cash stock, now have either none or else very few. Not only are they without stocks, but it is quite certain they will not enter the market as buyers until there is a change for the better in milling the ores extracted. It would seem, unless the pool wishes to confirm the public in the opinion that the mines are being looted, the mine managers would conform to the mining laws of this State, and give detailed statements regarding the work being done in the mines; and give the mine and car sample assays as well as battery assays. When this is done then mined men, who have dealt in stocks will come in, but until this change is made these men will fight shy of the game that gives to insiders the bullion, and outsiders the assessments. Notwithstanding the difficulty of drawing more mined men into their trap, the writer still believes that the pool will through cross-orders quote prices considerably higher before the end of the year, and to induce buying there will be circulated bull information from the mine, doctored to suit the pool's purposes. That legitimate bull information can be and will be given out, does not admit of a doubt, for the ore to do it on is in several of the mines. Before inaugurating, a big up move the market will probably be manipulated as it has been for some weeks past, with possibly still lower quotations and more assessments, so as to get about all of the few remaining stocks still out.

In 1880, the year when Con. Virginia went from about \$2 to over \$50, and Ophir from 35 cents to \$35, railroad securities at the East and in England were dull and very low up to well into the summer months, but in August they began to rally and a big boom set in in the month of September. This year railroad securities at the East and abroad were dull and very low up to about August, when a bull campaign set in and prices in last month (September) made quite a decided up move with still higher prices looked for. With a bull campaign in railroad securities and grain, the mining share pool can and doubtless will make a bull move in their securities, as was done in 1886. To that year it was the shorts aided them, while this year it will probably be on bull information from the mines.

Referring to the west ledge, the Virginia Chronicle in its issue on April 16, 1889, said: "The surface croppings west of the main Comstock lode indicate the presence of several large veins, which have been cut through in driving adit tunnels, which penetrated those veins at a few hundred feet below the surface, and they showed marked improvement at that depth. A large amount of bullion was realized from ore extracted in driving the Cole tunnel, which has a length of 2000 feet and cut through a solid body of highly mineralized quartz nearly 100 feet in breadth. The theory that nothing but a soft wall of syenite lies behind the footwall of the main Comstock lode has long been proved fallacious, as was also the theory that beyond the east clay of what was heretofore considered the hanging-wall of the main lode, search for ore would prove futile. Several important ore developments have been made in Con. Cal. & Va., and one in Hale & Norcross in the past two years beyond what was formerly considered the east clay of the hanging-wall of the main lode." The ore mentioned in the above extract has not been taken out. Coming down to a later date, we find an article in the Virginia Enterprise, August 21, 1891, regarding work in Con. Virginia, from which we learn that the south lateral drift on the 1100 level, which was run from the shaft into ore at the top of a raise from the 1300 level, well toward the south end of the claims, made a connection with a north lateral drift from the Best & Belcher, which gives them good air to prospect that level by crosscuts from the shaft to the south lode. Well-informed miners say that a connection will be made on the 1100 level with the Ophir to the north, and crosscuts run at intervals for its entire length, and then they "will stop upward by degrees until the 800 level is reached, repeating the operation of drifting laterally and crosscutting at the intermediate levels from the Best & Belcher to the Ophir. It will be remembered that a few years ago the Central tunnel, which starts on Mill street, immediately opposite the Ophir shaft to the south, was run 1500 feet to the ledge; that a fire occurred in the tunnel, and that work was then stopped after putting in a strong bulkhead. The formation to be followed in the work of exploration upward from the 1100 level leads to the ore found in the Central tunnel. The Rowe ore strike of many years ago is also a continuation of the same formation.

News from the Comstock mines report that in Con. Virginia on the 1800 level the drift is in low-grade ore, but miners affirm that the work is done in such a manner as to leave the rich ore to the west for future extraction. A west drift on the 1100 level is being run to tap the west ledge in its downward continuation from the 800 level. The ore is very high grade. The other work to the mine is of a development nature. In Ophir, Mexico, Union and Sierra Nevada, the work gains in importance as it progresses. In Hale & Norcross and Savage, rich ore is being uncovered and ready for extraction, but for whose benefit remains to be seen. The work in these two mines is more extensive than has been made public for several years. The work going on from Ward shaft is attracting considerable attention as it pushes to the west. Good news ought to soon come to hand from some of the Gold Hill mines.

From the Quijota, Tuscarora and Bodie districts, the news is of increasing importance, particularly from the Bodie, although insiders are discouraging buying by quoting the stock down. Well-informed miners say that very rich ore, and in quantity, is being taken out of Bodie. Of course, assessments are levied so as to get outsiders to sell and not buy.

SCIENTIFIC PROGRESS.

The Science of Animal Locomotion.

Mr. Edward Maybridge, formerly of San Francisco, and the artist who made the first attempt, at Stanford's stable, to photograph animals in motion, is now in Paris. He recently lectured at the Rooms of the Paris Geographical Society on the "Science of Animal Locomotion in Relation to Design in Art." Mr. Bartholdi presided, assisted by Prof. Elwall, and the Hall of the Society was filled with a brilliant audience, which included a large number of the most distinguished artists in Paris.

The lecture says the *American Register*, of Paris, was profusely illustrated with the results of an electro-photographic investigation of the consecutive phases of animal movements, executed under the auspices of the University of Pennsylvania, for the purpose of setting at rest at once and for all time to come the apparently never-ending controversy as to the manner in which an animal uses its limbs while executing the commonplace functions of locomotion.

For the purpose of enabling the audience to more thoroughly understand the scientific character of the investigation, and the care with which all its details have been conducted, there was first projected on the screen diagrams of the studio at the University of Pennsylvania, and the batteries of cameras, electro-exposers, chronographs and other apparatus; and the method was described of obtaining a dozen or more successive photographs at regulated intervals of time, simultaneously from three points of view.

A long series of illustrations followed, showing the consecutive phases of motion of the horse while walking, trotting, cantering, galloping, leaping, etc., and corollary phases, incidental to the same movements, by the buffalo, lion, elephant, and many other cloven and soft-footed animals; of the cloth while suspended by the claws; of the child while crawling on the ground; and of man when walking with swinging arms. After the facts had been shown by analysis, a synthesis of each respective movement was demonstrated by the zoopraxiscope; and this was so perfectly rendered, that the individual peculiarities of different horses could be easily detected. After the syntheses there were shown the various quadrupedal movements, as interpreted by those artists of accurate observation—the cave dwellers—who came no one knows from whence; who existed no one knows when; and who have gone no one knows whither; but some of the descendants of whom are probably handling the brush and using the chisel at the present day. These were followed by an exhibition of some of the artistic products of the Egyptians, Assyrians, Phœnicians, Etruscans, Greeks, Romans, Byzantines; the statue of Marcus Aurelius at Rome, the great source of modern error in the conventional representation of the quadrupedal walk; and illustrations by Albrecht Dürer, Verrocchio, Meisner, Paul Delarocque, Hans Makart, Rosa Bonheur, Schreyer, and many other eminent artists of mediæval, and of modern times.

The lecturer was unreserved in his condemnation of those artists who in their representations of the gallop use the fashionable conventional phase, which no artist ever saw. He contended that the first duty the artist owes to himself in his representation of animal motion, is to study the facts of nature, before going to her for his impressions, and when the facts have been acquired, he will be surprised how different his impression will be from that which he formed, when in ignorance of them.

No artist, who had ever properly studied the facts of nature, would for a moment think of putting the foot of a horse a full metre beyond his nose farther than the horse could himself possibly place his foot; or represent three yoke of oxen dragging a plough by six different methods of walking, when nature confines an animal to one method alone.

After the illustrations of quadrupedal movements, came a splendid series illustrating the flight of a bird, the independent action of the primary feathers was clearly shown, by several consecutive phases of the wing of a cockatoo during flight, and a synthesis of the analytical series of a vulture was represented by the zoopraxiscope.

The lecture was listened to with marked attention by the audience, the applause was hearty in the extreme, for all felt a new era was open to the artist, in his being afforded the opportunity of combining truth with earnestness and vigor in his representation of active motion.

ETHER IN SPACE.—Prof. Nipher read a very interesting paper at the late meeting of the American Association of Science on the "Functions and Nature of the Ether of Space." It was once taught, said the professor, that light was an electric pulsation in an incompressible medium. Then the theory found favor that it was an electrical displacement at right angles to its line of propagation. Then the ætætic and electric theories were ingeniously put on the same logical basis by suggesting for the former a rigidity zero for the compression wave—an audacious idea that created pleased surprise. Light in matter must be either more dense or less ætætic than that in free space. Ether at the earth's surface moves with it, being dragged along as if it were a vivid liquid. Ether in

water seems to be condensed to 9-16 of its volume in air. Yet after all the fine theories and beautiful experiments, it remains an open question whether ether or any part of it is at rest in space, or whether it sweeps through the interior of hodie as the wind sweeps through the leaves and branches of a tree.

HERBERT SPENCER ON LIBRARIES AND SCHOOLS.—Notwithstanding the high position which Mr. Herbert Spencer has justly attained in the walks of science and literature, he nevertheless holds to some ideas which must appear very antiquated to the American mind, especially. His writings show him to be a very determined opponent of both public education and public libraries. These two systems, which are regarded in this country as almost indispensable needs in well-ordered communities, Mr. Spencer considers to be actual invasions on the rights of citizens. Indeed he can find no words too strong in denunciation of a system under which A must pay toward the education of the children of B, as he expresses it in "grammar and gospel about things;" while the public library is set down as simply a device for gratifying C at the expense of D. Mr. Spencer once paid a visit to this country; but he seems to have taken little trouble to study the beneficial workings of our institutions. Whatever may be his manner of handling many of the great questions in relation to human life and science; his mode of discussing the conditions and growth of human society are anything but felicitous, or calculated to promote its healthy advance.

DISTRIBUTION OF GASES.—The relative density or heaviness of a gas has practically nothing to do with its distribution. The heaviest and the lightest gases are found on mountain tops and in the deep valleys in the same proportions. The foul gases from our lungs, from gas jets, candles and lamps, are generally denser than pure air at the same temperature, but they soon distribute equally high and low. An adult person ventilates ten cubic feet of air per minute. A lamp or gas jet fouls as much air as three men, or 30 cubic feet of air per minute. Air flues should be built in interior walls, and the flues themselves should be either circular or square, or as nearly such shapes as possible. The flat flue is very objectionable. The registers should be about twice as large as the flue section. The smoke flue should be near the furnace; it should be large, square and smooth, and the chimney top should be a little higher than the highest part of the house. There should be no contraction of the flue at the top. A chimney pot smaller than the flue is an injury, while one full size is no better than a regular extension of the chimney.—*Ex.*

EFFECTS OF LAKES ON CLIMATE.—Much has been written of late about the supposed effect of Salton lake on the meteorology of Southern California. The late cloudbursts and unusual excess of rainfall in that region has been attributed to the vaporization from the newly formed body of water, notwithstanding the well authenticated showing of the Weather Bureau that the unusual phenomena alluded to had their origin, as such phenomena on this coast usually have, in meteoric disturbances as far north as Oregon. Such a body of water can have but very little to do with producing rain in its immediate vicinity. A lake of comparatively limited area has much more to do with the temperature in its immediate vicinity than with the rainfall. Indeed lakes have a wonderfully tempering effect on climate. Thus, according to M. Forel, the quantity of heat accumulated in the Lake of Geneva during the summer of 1889 was equal to that given off by the combustion of 31,000,000 tons of coal, or the amount carried by a coal train 1120 miles in length. The greater part of the heat is gradually discharged into the air of the valley during the cold season, thus producing a milder temperature in autumn and winter.

A SAWYER ON WINOS.—The bill of a moquito is a complex institution. It has a blunt fork at the head and is apparently grooved. Working through the groove and projecting from the angle of the fork is a lance of perfect form, sharpened with a fine bevel. Beside it the most perfect lance looks like a hand saw. On either side of the lance two saws are arranged, with the points fine and sharp and the teeth well defined and keen. The backs of these saws play against the lance. When the mosquito alights with its peculiar hum, it thrusts its keen lance and then enlarges the aperture with the two saws which play beside the lance until the forked bill with its capillary arrangement for pumping the blood can be inserted. The sawing process is what gratifies upon the nerves of the victim and causes him to strike wildly at the sawyer.—*Journal of Health.*

DIFFERENT KINDS OF STARS.—There are three well-defined classes of stars, judged by the quality of light they yield. In the first class are the clear white and bluish white stars like Sirius and Vega. These are supposed to be the hottest stars and the most luminous in proportion to the extent of their surface. Then there are the golden yellow or pale orange stars, of which Arcturus and Capella are fine examples. These have begun to cool. Finally, we have the deep orange and red stars, like Aldebaran and Antares. These have advanced still further in the cooling process.

MECHANICAL PROGRESS.

Modern Guns and Gunnery.

There is just being completed in the Washington naval ordnance foundry the first 40-caliber six-inch gun built for the navy. The length of a gun is technically measured in calibers and to say that a gun is 40 calibers long means that the length of its bore is 40 times its diameter. The length of the bore of this new gun is, therefore 20 feet, or, to be exact, 20 feet 3 3/4 inches. It is the longest gun yet built for the navy—35 calibers having been the limit heretofore. The additional length is expected to increase its efficiency, and it is expected that with the ordinary service charge it will give a projectile weighing 100 pounds the enormous initial velocity of 2150 feet per second. This will give the gun a very long range and a very flat trajectory at all ordinary ranges. The gun now being completed is one of a pair to be mounted on the triple screw flyer cruiser No. 12. The great range of these guns combined with the great speed of that vessel, it is held, will enable her to choose her own positions, and if she should fall in with an enemy with an old pattern of guns she would be able to do considerable damage while keeping out of his range.

What a Modern Gun Can Do.

Unless one is actually brought into business relations with the great science of modern warfare, it is difficult to conceive of the terrible power of the latest and largest guns. These engines of destruction, weighing 110 tons, hurl a projectile of solid steel 16 inches in diameter and nearly 4 feet long at a velocity of 2,079 feet a second. When tested recently, one of these guns sent a shot through 20 inches of steel armor, 8 inches of iron, 20 feet of oak, 5 feet of granite, 11 feet of concrete, and 3 feet of huck. Comparatively, a locomotive weighing 200,000 pounds would have to spin along the tracks at a rate of 135 miles an hour to strike a blow equal to that projectile. Think of the damage wrought in a railroad collision where the train speeds along at the rate of 30 miles an hour, and one may calculate the destructiveness of modern ordnance.

The Resistance of the Best Armor Plates.

One would think from the above that nothing which could float would stand against such a pounding. But the above plates were simply "steel armor," with granite, wooden and concrete backing. But American ships have recently produced a "nickel-steel plate," which is much stronger for protective armor than anything of equal thickness of steel alone. On the 5th of September the Navy Department at Washington made an experiment of the relative resistant capacity of steel and nickel-steel for protective deck armor. A 6-inch projectile weighing 100 pounds was fired against two targets, one composed of two 1 1/2-inch all-steel plates, and the other of two 1 1/2-inch nickel-steel plates. In the round against the nickel steel plate the projectile was given a velocity of about 100 feet greater than with the all-steel, giving a striking force of nearly 300 tons greater than against the all-steel plate. The result showed very clearly the superior quality of the nickel-steel, as the all-steel target was perforated, the projectile passing through both plates, two feet of oak and eight feet of earth backing. The projectile fired against the nickel steel glanced off without rupturing the upper plate. It made a small crack five inches long and an indentation about five inches deep. The projectile itself was shattered into small fragments.

Nickel-Steel to Take the Place of All-Steel

In consequence of the wonderful resisting power of nickel-steel over all-steel, as manifested in the experiment last above mentioned the Navy Department has since issued an order that the upper layer of inclined deck plates for Cruisers 12 and 13, the commerce destroyers, and of the battle-ships Indiana and Massachusetts, are to be constructed of nickel-steel.

The Contest Between the Gun and the Armor Plates.

It was but recently thought that the resisting power of armor plates, which a ship could carry and float with safety, was fully reached, and it was also thought to be quite as fully proven that the best ordnance was able to penetrate such armor. But now the circumstances appear to be reversed. The superior character of nickel-steel enables our ships to secure greatly increased resistance with even a much reduced weight, and the guns are once more in the background. Their best projectiles are shattered against the nickel-steel, and hence it follows that our gun makers must take another step in advance to meet the latest improvement of the armor plate makers. When or how this battle between the gun and armor plates will end, who can tell?

ENGLISH VS. AMERICAN SHIPBUILDING.—Notwithstanding the general superior quickness of American mechanics over those of every part of Europe, there seems to be a certain important point in which, in the matter of economy, English shipbuilders excel American builders. This specialty has been brought out by Mr. Charles H. Cramp of the famous Philadelphia shipbuilding firm, who has spent three weeks visiting the great naval yards of England. He recently gave a dinner to the officers of the English Admiralty, who afforded him facilities for inspection. In discussing the results of his

observations, Mr. Cramp said there is no money wasted on fancy work in the British war vessels. Everything not absolutely necessary is excluded from the outfit and equipment of their ships. The constructors know what they want and do not bother with doubtful possibilities as we do in America. There is a good deal of difference in the cost of warships here and at home. The excessive cost of our ships is altogether due to superfluities in the way of outfit and equipment, and the severe exactions and useless inspection of the quality of materials. As between America and England, there is very little difference in the cost of merchant marine vessels, such as the Inman and White Star lines, but the naval architect in England is far ahead of America and every other nation in the world.

AMERICAN ZINC ORE FOR GERMANY.—Efforts are being made to get the highly scientific ore reducers of Germany to become regular buyers and handlers of American zinc ores. The Southwest Missouri and Southwest Kansas Lead and Zinc Association has for some time had an agent in Germany working to get the smelters there interested in American zinc ores. He has been showing them samples of our ore and telling them of what immense quantities of ore carrying large percentages of zinc there are in the United States. The Germans have become convinced that if zinc ore exist in the United States in kind and quality represented they can make far more by handling American ores than they can with their own. The zinc producers of Missouri and Kansas and the zinc smelters of Germany are accordingly working together to have special transportation rates on ores made from the mines to the smelter, and to have the duties taken off zinc ores in Germany. These efforts to introduce our zinc ores into Europe will be watched with much interest by our American zinc miners.

STEEL BRIDGES.—There are now five steel bonds spanning the Ohio river and holding in close embrace the identified interests of Ohio and Kentucky. The last, between Cincinnati and Newport, is of the cantilever type and consists of two spans, 252 feet each in length, with an immense central span across the channel measuring 520 feet. In addition, there are two spans of steel trusses of 254 feet each, making the total length from the opposite approaches 2916 feet, or a little less than three-fifths of a mile. The bridge consists of a roadway 24 feet in clear width, with two street railway tracks for electric cars and two seven-foot sidewalks. The lower chord at the center of the span over the channel is 108 feet above mean low water, a height sufficient to clear any craft that moves upon the waters of the Ohio. There is probably no branch of mechanical engineering in which greater advance has been made during the last 40 years than in bridge construction.

STEAM WAGONS IN SAN BERNARDINO.—It is said that the owners of the San Bernardino county iron mines, near Hasett, propose to haul ore from the mines to the railroad with a steam traction engine. The steam wagon are already at Daggett, and were built by J. B. Osborn of that place, to haul ore 100 miles across the Mojave desert. Each engine hauls two trail wagons. The engines have 20 horse power rollers. Auxiliary engines are placed in the trail wagons, which are connected with the forward rollers by steam pipes. This enterprise will require the building of a special road of twenty miles in length. The wagons are expected to make a trip every two days, hauling twenty tons of ore.

AMERICAN IRON IN CANADA.—Canada, especially Ontario county, is just now absorbing large amounts of iron from the United States, where a year or two ago all the iron was imported from Great Britain. The iron which is thus finding its way into the consumption of our northern neighbor consists mainly of pig iron. Pig iron is selling to-day in Toronto, which goes all the way from Alabama. But especially and to a large extent other irons are beginning to follow in the course of pig. When we consider that Canada collects a duty of \$14.50 on a ton of bar iron which costs about \$27.50, and 60 cents per 100 pounds on common steel, we may well imagine the great benefit which would accrue to both countries from reciprocity.

CASTINGS FROM RAW ORE have been most successfully produced in Sydney. An ordinary blast furnace was employed and the castings produced were pronounced first-class. The experiment was made with 75 pounds of Tasmania ore, to which 14 pounds of limestone was added, and the iron ran into pigs, from which castings of various descriptions were made. Some of the iron so produced was put into a lathe to show that it was not too hard for working. The *Australian Mining Standard*, from which we condense, says that the iron proved to be of the very highest quality and of exceedingly fine and close grain and very tough.

AN APPROPRIATE AND SOLID PLATFORM.—When Major McKinley recently spoke at Mingo Junction, Ohio, the platform upon which he stood was made of pig-iron and steel billets with a floor of nail plate and walls covered with American tin plate. The roof was of the same bright material.

ELECTRICITY.

New Electrical Appliances.

Below will be found the new appliances of electricity which have come to hand since our last issue:

Electricity in Saw Repairing.

A most important novelty in the application of electricity to industrial purposes which has come to hand the past week is its use in repairing saws. The hardest steel at present successfully worked by the electric welding process is that used for hand saws. Besides the regular work of making the joint in continuous band saws, it has been ingeniously adopted for replacing broken teeth in finished saws. Formerly it was necessary to cut down to a smaller size any saw from which one or two teeth had been broken, thus losing not only the difference in price between the two saws, but also the entire cost of labor in cutting the original saw. Now when a tooth is broken out, they simply fit in a new tooth, which is electrically welded in place, and a drop of oil applied as the completion effectually restores the temper of the saw to a serviceable point.

Blasting by Electricity.

Electricity has been advantageously employed in firing charges for blasting purposes. But quite recently a method of actual blasting by electricity has been tried in Sweden with good results. This means consist of a voltaic arc produced between two carbon rods placed parallel. When the arc is moved close to the spot to be blasted an intense local heat is created, resulting in expansion that splits the rock.

New Application of Electricity in Warfare.

Electricity has been suggested for many purposes in warfare, and especially for the projection of light in order to disclose an enemy's position, and for various similar purposes; but now we have precisely the same means suggested for elevating a distant screen to conceal tactical operations against an enemy. The principle and mode of operating this device is given as follows: An atmosphere laden with a mist or smoke has a pronounced tendency to diminish the strength of an electric light. This beam of light crossed by another at a certain angle makes a perfect screen at the point of intersection. This will be adopted as a means of forming a screen, behind which tactical operations may be secretly conducted. Manifestly, there is no possible way by which this intangible screen can be either removed or penetrated by an enemy, except by destroying or driving away the opposing forces—the projectors. The great utility of such a device in military tactics must be obvious to every one.

An Electric Headlight for Horses.

A novel headlight has recently been invented by parties residing in Stockton in this State—Frank P. Adams and John E. Cook. The device consists of an electric light of two-candle power or more, run by a storage battery and placed upon the forehead of the horses. The *Stockton Mail* says that trials of the invention made in that city have proven that it is simple and eminently useful. It is also said that the storage battery need be the invention of Messrs. Adams and Cook, is one of their own invention, and cheaper and lighter than any of the same power yet devised.

An Electrical Piano Forte.

London *Iron* says that a very novel and most useful electrical attachment for a piano forte is on exhibition at the Frankfurt Electrical Exposition which is attracting much attention. It is the invention of a German soloist, Dr. R. Eichenmann, and consists in attaching a series of small electro-magnets to a metal running parallel with the keys of the instrument, one magnet being fixed above each string. One of the ends of the electro-magnetic wire is fastened to a metal rail, which, by the gentle pressure of a pedal, becomes connected with the electric current, while the other is brought in contact with a metal spring, which, when the key is struck, cuts out the current by the interpolation of current arresters, a microphone being applied in this case. On pressing the pedal and striking a key, the current flows through the windings of the corresponding electro-magnet, and through the microphone, the latter intercepting the current in exact proportion to the number of vibrations of the string. It is thus possible to prolong the sound as long as may be desired. The continuity of the sound, the strength of which depends on the force of the pressure of the key, imparts to the instrument the characteristic tones of the organ. But the results of the electrical action are found to be most surprising in the bass, the sounds emitted being described as a blending of the tones of the bass viol, violoncello and harp. The center notes of the instrument do not show any appreciable alteration in intonation, while the higher notes are said to bear a strong resemblance to the strains of an æolian harp.

To Prevent Scriveners' Palsy.

It is very generally known that the use of a steel pen, more or less constantly, causes a numbness in the fingers and hands which, with many, gradually passes into what is known as "scriveners' palsy," which sometimes quite unfits any one from writing at all, or at least only with a pencil. It is now generally supposed

that this palsy is induced by a current of electricity, which is produced by the friction of the pen upon the paper. It is well known that friction of any kind upon paper produces electricity, and it is very naturally inferred that this electricity is conducted through the steel pen and iron clasp to the fingers, which are generally moist and in contact with the upper portion of the clasp. The acidity of the ink no doubt greatly facilitates the production of the current. To avoid this, it has been suggested that the penholder should be made of paper, which is less a conductor of electricity than wood, and that the clasp which holds the pen should be made very short, so as to come below the touch of the fingers. The device is said to have been successfully employed, rolled paper being used for the holder. The gentleman who has made this suggestion and foregoes his privilege of securing a patent protection for his device, as he might have done, has been dubbed an "electrical crank." It would be well if we had many more just such "cranks," if they employed their crankiness in such a useful direction.

Electric Road Building.

New electric roads are constantly being projected and built in all parts of the country and in all parts of the civilized world as well. Our own city and State are no exception.

The Proposed Alameda Road.

Has already been noticed in these columns. The County Supervisors of that county have recently made a careful examination of the line of the proposed road, the motive power of which is to be electric. The road when completed will be about ten miles in length. It will commence at Shell Mound Park, go on to San Pablo avenue, come down toward Oakland a few blocks, then run along 45th street, pass Livermore's place, Thermal Vale Nursery, and go to the Catholic Cemetery. From there it will curve round, passing through Livermore's land and Dingee's field, passing to the north of Mr. Dingee's residence, skirt the foothills, pass Joaquin Miller's house, and come down east of the Hermitage. Then it will come along three blocks on the old San Leandro road in a westerly direction, cross through the Bray tract, and thence down to Fruitvale station.

An Electric Road to South San Francisco.

Irwin C. Stamp, Ahner Dohle, W. R. Hearst, P. N. Lillenthal, W. S. Chapman, Monroe Greenwood and William Hollie have petitioned the City Board of Supervisors to grant them a franchise for a street railway to extend from Market and Sixth streets to South San Francisco. The route proposed is along Sixth street to Brannan, thence to Eighth, to and across Townsend and Channel to Kansas, then to Santa Clara, to Connecticut, to Solano, to Kentucky, to and across Tular, Islals creek and Islals street, to Railroad avenue; and also from the corner of Kentucky and Solano streets along Kentucky to Fourth, and along Fourth to King. The petitioners promise that all the material entering into the construction of the road shall be of California manufacture, and propose that at least \$10,000 shall be expended within the first year, and two per cent of the gross receipts of the road be paid over to the city. This latter proposition presents a new and very proper feature which should enter into every city franchise of the kind.

The Road from Hayward to San Jose.

The Alameda Board of Supervisors have granted the charter asked for by Chapellel and others of Oakland for extending the line of road to the county line, whence it will be continued to San Jose by the same company. The particular electric system which will be adopted has not yet been determined on. So rapid is the march of progress in this direction that it is considered advisable to wait until the latest moment before deciding on this matter. The construction estimates of this road foot up fully \$400,000.

A Fresno Electric Road.

The County Board of Supervisors of Fresno have granted a franchise to Fulton G. Berry and J. R. White for a street-car line along Elm avenue, to be operated by electricity, cable or horse power. It is stipulated that the construction of the proposed line must be begun within three months, and completed inside of a year, otherwise the franchise becomes forfeited. It is understood that the intention of the projectors is to put in an electric line, and to begin work immediately.

The Mount Wilson Road Near Pasadena.

There is likely to be much rivalry in the construction of the railroad to the summit of Mount Wilson from Pasadena. The owners of the toll road propose now to widen it and build an electric road. Water has been found on the mountain, which can be run down 1,500 feet, and give 125-horse power to run a dynamo, and then be conducted 1,500 feet further down to run another dynamo. The two together would be sufficient to work the road.

A Portland Suburban Road.

Portland papers announce the organization of a company with a capital stock of one million dollars, and the purchase by the company of the Williamette Bridge and the Transcontinental Street Railways Companies, comprising over forty miles on both sides of the river, with connections across the two bridges. The lines on the east side are all electric or

steam motor lines. The latter will be changed to electric, and the lines on the west side will also be changed, and all cars from the east side will come into the city. When this is done the company will have one of the most complete street railway systems in the country.

STEAM BOILER NOTES

To Beat Steam.

The schemes to heat, in an economical way, steam made from water as a working fluid in an engine have been, and will undoubtedly continue to be, numerous. There is, beyond question, a wide field for the gas engine and the hot-air engine, for small power, not because either gas or air is, *per se*, more economical than steam, but because the conditions are sometimes such as to make the use of either gas or air advisable. The whole problem is complicated by the conditions that surround the case. That is, while it might be advisable to use gas or hot air for small power, no one would expect to run a two hundred horse power engine as cheaply with gas or hot air as with steam. But the fact that some fluid other than steam is best in each instance leads a good many to believe that steam is a poor medium.

Then in the instances of electric motors, they are in many instances an excellent means of distributing power, but in disclosing their use they are most ridiculously placed in the position of prime movers, as if, in nine cases in ten, their use did not make room for a very material increase in steam power.

An old idea is to use air and steam in combination. We have no knowledge of how old this idea is. But more than thirty years ago a farmer of Rensselaer county, N.Y., "invented" an engine in which a mixture of steam and air was to be used. He sold his farm to put his idea into practice, and after building an engine refused one hundred and fifty thousand dollars for a part interest, and the outcome was that he lost all his investments.

This scheme, in various forms, has come up ever since, and with great regularity. Sometimes it has taken the form of injecting air into the boiler, thence to be heated and mixed with the steam; sometimes some other means of bringing about the mixture of air and steam was employed.

The latest move in this direction is being made by Edward Field, C.E., of England. Mr. Field is well known by the boiler that bears his name, and he is impressed with the idea that by his plan of mixing a little steam with a good deal of heated air he will bring about important economical results.

As in most other cases of the kind, Mr. Field starts out with the rather popular fallacy that the air can be heated—up to 404°—by waste heat, practically without cost. However, it is said that he makes a saving of between forty and fifty per cent as between his mixture and steam pure and simple—a statement which we shall be glad to see verified, but in which, at the present, we have not the least faith.—*Am. Machinist*.

COMPOUND ENGINES.—Every pound loss of coal burned in a fire room means more profit for the business. It means less wear and tear on boilers, and less coal to be handled by the fireman. Because all this is coming to be better understood is one of the chief reasons why better devices can find a ready market. There isn't much reason in putting in a compound engine to save steam, and then generating the steam in a boiler that will evaporate no more than six or seven pounds of water per pound of coal. Compound engines are generally designed with special reference to the pressure of steam to be carried, and any means, such as a damper regulator, proper feed appliances—in fact, anything that will help the fireman in keeping his steam at that pressure will save coal. The boiler is usually calculated to stand a given steam pressure, and there are very few modern engines that will not give better results with the highest admissible steam pressure. Therefore not only should the fireman work to the end of maintaining the higher pressure, but he should be provided with the best means of doing this.—*American Machinist*.

HEATING BY RADIATION.—In applying Siemens' principle of heating by radiation, or free development of flame to boilers, it is necessary to prevent the flame, in its active stage of combustion from touching either the sides of the boiler or its brick-work setting. The flame is allowed free space to burn in, and thus good combustion is obtained, after which the products of combustion are brought into intimate contact with the surfaces to be heated. While combustion is going on in the open space, heat is transmitted by radiation only; but after active combustion is completed, it is transmitted by contact, and it is in this manner that flame must be applied to boilers, and may be applied equally well to nearly all heating operations.

THE PERRY STEAM ENGINE INDICATOR.—In this device a beam of light is reflected from a mirror mounted upon an elastic diaphragm, which is distorted by the steam pressure upon its opposite surface. The path traced by the beam is a true diagram of the working of the engine.

GOOD HEALTH.

HOT WEATHER SUGGESTIONS.—During the heated term a few good resolutions should be made. Among the first should be one to cultivate tranquility of mind. Nothing more conducive to comfort of body. In hot weather a fiery argument is almost as productive of a raised physical temperature as is a brisk walk in the blazing sun. Moreover, its effects are less rapidly dissipated, for it is easier to sit down and get cool after hotly exertion than it is to subside the perturbed mind that it will not once a series of "hot flashes" for possibly hours after a vehement discussion. The same rule that applies to minds exerts the same force and temper should be observed in intellectual pursuits conducted in the dog days. Do not attempt to shirk steady work in this line, but let all you do be done methodically not spasmodically. Adherence to the German motto, "Without haste, without rest," is really less wearying than a series of violent efforts resulting in a fatigue which can be relieved only by utter repose. So much for the mental attitude in hot weather. The hotly condition is of equal importance. Many people seem to think that seas in summer can only be obtained by laziness, that employment of any sort is the mortal enemy of *bien-être*, and so devote the whole of the long days to what is expressively termed "loafing." What wonder if for them the weeks drag drearily, and that they hail the return of shortened days and frosty nights as a release from ennui? There is no better way to keep cool than to have some regular occupation, be it never so trivial, that will serve to divert the mind from the hotly condition. No matter what this employment may be, whether the charge of certain branches of housework, the doing of the family mending, the conducting of a course of reading, the studying of a language or a science—whatever it is, let it be made a duty, and followed conscientiously.

THE VALUE OF WALKING TO HEALTH.—Few things, if any, are so effectual in building up and sustaining the physical organization as walking, if resolutely and judiciously followed. It is a perfect exercise. It taxes the entire system. When you walk properly every member and muscle, every nerve and fiber has something to do. The arms swing backward and forward, keeping step, as it were, with the legs; the chest expands and contracts as the lungs fill and discharge; the drummer boy pulse beats a tune for the march; the legs curve and straighten; the feet rise and fall, while the head rides over all—but not as a dead head. Every once it has is employed, every faculty alert. The nostrils expand to quaff the breeze; the ears turn to every sound; the eyes roll in their sockets, sweeping from left to right, from earth to sky; the brain is at work through all its parts. Progress under such conditions is the very essence of physical motion. What is the effect? The flesh is solidified; the lungs grow strong and sound; the chest enlarges; the limbs are rounded out; the tendons swell and toughen; the figure rises in height and dignity, and is clothed with grace and suppleness. Hunters, who walk much, are tall and straight, while sailors, who scarcely walk at all, are low and squat. The whole man is developed, not the body merely. The mind is broadened by the contemplation of creation's works, the soul is enlarged, the imagination brightened, the spirits cheered, the temper sweetened. The moral forces are strengthened equally with the physical. A loftier reverential feeling is awakened, if not a profound religious sentiment. No one who rightly walks the fields and groves, or climbs the heights beneath the heavenly dome, with its blazing sun by day and its moon and countless stars by night, but is irresistibly drawn toward the Infinite, as he "looks through Nature up to Nature's God."—*A Seagenerian, in Belford's*.

SWALLOW COLD DRINKS SLOWLY.—In my opinion, said a physician, it is not so great a mistake to indulge in cold drinks in warm weather as it is to drink them rapidly. On a hot day it is almost inevitable that people should drink, and what the system seems to crave is something cold. If that something could be a little less than ice cold it would be so much the better. But it is practically out of the question to get a drink of a temperature of 40° or 42°, say, which is about as cold as is necessary in order to meet the demands of nature. So, then, ice-cold drinks are likely to remain a permanency, and thousands and thousands of people will continue to drink them. Now, what I should advise is that they perform the operation with some deliberation. The man who swallows a glass of soda water, or anything else at a temperature of 32 or thereabout, does a dangerous thing. The danger is in suddenly chilling the nerves of the stomach, and the result may be sudden paralysis. There is neither sense or reason in drinking thus rapidly. I do not mean, on the other hand, that it is necessary to wait until the drink, whatever it is, has grown warm. What I plead for is that people should take 15 or 20 seconds, or even half a minute, in swallowing a glass of soda or beer, or whatever they use to satisfy their thirst. Everybody can afford that much time, even the most hurried man, and the result cannot fail to be decidedly advantageous in the long run.—*N. Y. Tribune*.

Passing Events.

The opening of the Stanford University this week is an important event in the educational and industrial advancement of this State. The instruction given will be largely of an industrial and technical character. Already a much larger number of students than was expected have applied for admission. Judging from appearances the new University will quickly become a popular one.

The discovery of tin in Washington is announced. It was found about one mile from the Culver gold mine on Peshastin creek, near the base of Mt. Stewart. Little is yet known of the real value of the ore.

The first section of the new belt-line railroad on the water front of this city was completed this week, and all that portion north of Market street will shortly be ready for use. This is an important thing for the whole city, and much expense of teaming will be avoided.

The Sacramento Supervisors have visited certain hydraulic mines of Placer county and conferred with the miners who ask for certain time to clean up their bedrock. The proposition has been taken under advisement and it is probable the men will be given specified time in which to do the work they want to.

FOREST FIRES in Eldorado county this week have been doing some damage along the Georgetown Divide.

The Situation in Iron.

The iron situation is receiving renewed attention, with the prevailing opinion being that all indications point to active markets and higher prices being near at hand. This opinion is not grounded on a speculative movement, although that may come, but upon a legitimate demand brought about by renewed life in all industries, consequent upon bountiful harvests and good prices. Taking one item of farm product—cattle—and the yield this year over that of 1890, averages about 30 per cent, while the prices that have been realized are fully 20 per cent more than were obtained in last year. It is this large increase in the crop and increase in prices upon which leading economists found their expressed views of better markets and better prices for pig iron. It is argued that the enormous sums of money which must flow into the hands of our farmers cannot help having a stimulating influence upon all kinds of business. As the *Iron Age* says, we must expect that the farmers will purchase liberally supplies and machinery, household goods and even some luxuries, and that many will be able to free their property from encumbrances. We must look forward, therefore, to more than the usual demand from the agricultural population.

To move the enormous crops the railroads will be taxed to their utmost and with their increased income derived thereby they will be in the market for both rails and rolling stock. Those in position to know unhesitatingly affirm that many railroad companies deferred their usual yearly purchases this year, owing to their finances not permitting them to buy, but next year these roads will be in the market as heavy buyers. That the railroads have been light buyers this year is witnessed in the small consumption by rail mills of pig iron (aggregating only from 125,000 to 150,000 tons per month), but notwithstanding these small purchases the stock of pig iron in this country does not show an increase, and this, too, in the face of the largest production within the history of the country. Let the rail mills be called on for increased quantities of rail and their consumption of pig would readily be brought up to over 200,000 tons per month. Such a large demand, added to the demands for iron from other quarters, as the result of general business activity, would simply strain the furnace capacity of the country to the utmost, besides using up the present stock of pig which would inevitably lead, as claimed, to better prices.

To Open New Asphaltum Fields.

It is stated that the Southern Pacific Co. will build a new branch line from Wade (a station on the main line south of Bakersfield) to Armona, the southern terminus of the new West Side line which the company intends to construct. Plans have also been prepared for another road to branch from the one from Wade to Armona, and reach a large deposit of asphaltum on the Coast Range. This line is between 20 and 30 miles long. Col. C. F. Crocker says it is very important to reach these asphalt beds, for it will give San Francisco a good cheap supply. This asphalt is mixed with coal dust and formed into bricks by hydraulic pressure and used as fuel in the S. P. Co.'s locomotives. Mr. Douty of the Pacific Improvement Co. says this fuel gives satisfaction to the engineers. It is made in small quantities in Oakland, but if the asphalt can be obtained cheaply, this style of fuel will largely replace coal.

The opening of these new fields by railroad service should be not only of great importance to that section of the State, but to the larger cities, where the material is now in much demand.

Most of our asphaltum, bituminous rock, and material of a kindred nature, now comes here from San Luis Obispo, Santa Cruz, Santa Barbara and Ventura counties, on the southern coast. None of the deposits back of the Coast Range have as yet been opened to any great extent. This State now produces some 50,000 tons a year of the various semi-solid bitumens generally known as asphalt. Utah produces some 3000 tons and Kentucky a few hundred. Aside from these, California furnishes the whole product of the United States. The production amounted to little until 1888, when it jumped from 4000 to 50,000 tons in this State, and this is now being annually increased. Old deposits

have increased their output and new ones have been opened. The material from the San Joaquin valley differs from that found on the coast, and is better adapted for fuel purposes when made into briquettes with coal dust. The coast product is mainly utilized for street pavements and sidewalks. The asphaltum industry of this State is now a very important one and is destined to become much more so.

The Stanford University.

The formal dedication and opening of the Leland Stanford, Jr., University took place on Thursday of this week. Over a thousand applications for admittance had been made before the opening and out of this number 320 students passed the examination and were admitted. At present there are only dormitory accommodations for some 300 boys and 60 girls, but many of the students will board outside the college grounds. Two more dormitories for girls are about to be built. That for the boys is one of the fine stone buildings on this coast, and alone cost some \$300,000. The inner quadrangle, comprising the recitation rooms, is all complete. This is built of stone, as are the power-house, engine-house, foundry and machine shops, which buildings are completed but not entirely equipped. The large museum building will soon be finished.

It is Senator Stanford's idea to make this educational institution as practical a one as possible, where boys and girls will be properly equipped to earn their own living. The industrial features will be prominent. It is not likely to be a "kid-glove" college for the children of the rich, but rather one where the great middle-class people will gather. Already, among those admitted, are a number who will perform work around the college in return for their board and lodging, while studying. Trains are to be run from San Francisco and from San Jose to bring day scholars, and in a short time the number now on the rolls will be largely increased.

The writer has visited the college several times in the past few months, and is impressed with the earnestness exhibited by the generous founder of this institution. It is no mere college "on paper," and though an immense amount of money has already been spent, it is very little compared with the sums necessary to carry out the whole general plan which has been adopted. From this time on, however, work will be carried on much more rapidly with the buildings to be erected. The outer quadrangle chapel and memorial arch, the most notable structures of the group, will soon be commenced.

Everything in and about the buildings is of the very best material and character. Nothing cheap or shoddy has been used. The buildings are of stone or concrete, and made to last.

Ten of the new cottages for the faculty have been finished and 30 more are to go up at once. It is probable, too, that a number of other buildings for the parents of pupils will be erected and rented.

We go to press too late to give an account of the dedicatory exercises, but feel assured that a visit to Palo Alto will impress parents with the great value this college will be to the young men and women of this community, even if it opened with no ceremonies at all.

Every possible thing for the comfort, health and convenience of the students has been sought out and adopted. A competent corps of professors and instructors is ready for work. Appliances of all kinds for instruction will be provided. With an abundance of money at command, the founder of this institution has been enabled to start fully equipped such a college as usually takes years to build up.

For the first year, 1891-92, chairs will be established, and instruction, undergraduate and graduate, will be given in the following lines of work, the character and gradation of the instruction to be adapted to the needs of the students in attendance. Mechanical engineering, civil engineering, mathematics, physics, chemistry, geology, botany, zoology, physiology, philosophy, ethics, history, political science, English language and literature, German, French, Latin, and Greek.

The entrance requirements are the same as for the State University at Berkeley. Tuition in all departments is free, but the price fixed at present for board in Encina Hall is \$3 per week. Rooms, with light, heat and attendance, are offered at the rate of \$1.50 per week for each person. If two occupy one room; \$3 per week if occupied by one person, but single occupancy will not be permitted if the rooms are needed by other students. Washing will be charged at cost. The expenses of the student in Rohles or Encina Hall (boys and girls dormitories) need not exceed \$200 for the year, President Jordan says, exclusive of clothing and railway fares.

The Molesworth Calcining Process.

One of the weak points of metallurgy is the "sweat" calcination of ores in a cheap and effective manner, combined with rapidity. This sort of calcination is very necessary when preparing fine pyrites containing gold, either for amalgamation or chlorination; in the first case, badly calcined pyrites would sicken the mercury; in the second case, the sulphate of iron formed would precipitate any gold that might pass into solution while still mixed with the ore.

Both chemical processes and mechanical appliances have been pushed forward at all times to facilitate the calcination of auriferous pyrites, and anything that will simplify the treatment of such ores is jumped at by the metallurgist, as it will give him command over a greater quantity of mineral matter, besides enabling him to handle alone that at present will not pay to work; yet, up to the present, it is hard to find any process or appliance better suited for calcining concentrates than the ordinary stationary reverberatory furnace, in spite of the many alleged improvements of various inventors.

Mr. Francis Hylton Molesworth of Adelaide is the author of one of the latest methods of calcining. Danvers Power, writing on a Victorian official report, speaks as follows of the process: He makes use of the fact that certain compounds act as carriers of oxygen, which is the vital element in calcination—that is, some compounds will take up oxygen from the air, but will give it up again when in the presence of anything that has a greater affinity for it. It may be thought that we might as well pass the air direct over the heated pyrites without the intervention of a carrier, but we must remember that when oxygen is in a nascent state—i. e., immediately it is given off—it is more active than in its ordinary condition in air. The slight expense of cheap chemicals is more than covered, if a more rapid calcination can be carried on, for not only do you lessen the labor charges, but the capital lying idle is greatly diminished. The chemist Mr. Molesworth prefers to use cyanide and sulphuric acid, these acting on each other produce a gas called nitric oxide, and this taking up more oxygen forms nitric peroxide.

A small trial plant was erected at Gawler, South Australia, and now a larger furnace with improvements is being put up at the Alma and Victoria mine, Wenkaranga, S. A. The furnace (see engraving) is made of iron, 15 feet long, of a conical shape, and set on an incline, with the smallest end lowest. This revolves on friction pulleys. The fire-box is under the smaller end of the roasting chamber; the products of combustion circulate along flues arranged round the furnace, and do not enter the furnace itself, thus avoiding the dilution of the atmosphere within it. The ore is fed in at the wider end of the furnace, and as it revolves, the fine particles are raised on shelves and split through the atmosphere, the whole gradually working its way down to the exit at the smaller end, on account of the tilt given to the apparatus; thus the reheating and drawing of the old reverberatory furnace is here made automatic.

The peroxide, together with fresh air, passes in over the ore at the exit end of the furnace, where the ore is already nearly roasted, and therefore will not rob them of much oxygen, besides being at its greatest artificial heat, for if not assisted by the heat conveyed to it by conduction, the heat due to chemical action of the ore would not be sufficient at this latter stage to complete the process; as the peroxide and air pass up the furnace, the oxygen combines with the sulphur, arsenic, etc., which is in a solid state in the ore, and forms a gas which increases in bulk; it is on this account that the furnace is made wider at that end the gases escape, and the ore is fed in. The gases, and any dust they may hear away, pass into condensing chambers under water, and are drawn into the stack by a fan. The fine dust is thus saved, and any acids present collected in the water, which Mr. Molesworth suggests using for subsequent treatment of the roasted ore. It will be noticed that it is only gas that is introduced into the furnace; the chemicals are not mixed with the ore, so it is not liable to clot together, and the heat is not sufficient to slag the minerals.

THE nugget recently found in the Ruby mine, Sierra county, is valued at \$3800.

World's Fair Buildings.

We give herewith an interesting group of views of buildings now in process of construction for the Columbian Exposition at Chicago. The lower one represents the building which will appeal most directly to the interest of California readers, and that is the structure devoted to the display of horticulture and horticultural products. The building will face an artificial sheet of water. In front there will be a flower terrace for outside exhibits, including tanks for nymphs and the victoria-regia. The front of the terrace, with its low parapet between large vases, borders the water, and at its center forms a boat landing.

The building is 1000 feet long, with an extreme width of 286 feet. The plan is a central pavilion with two end pavilions, each connected to the center pavilion by front and rear curtains, forming two interior courts, each 88 by 270 feet. These courts are beautifully decorated in color and planted with ornamental shrubs and flowers. The center pavilion is roofed by a crystal dome 187 feet in diameter and 113 feet high, under which will be exhibited the tallest palms, bamboos and tree ferns that can be procured. There is a gallery in each of the pavilions. The galleries of the end pavilions are designed for cafes, the situation and surroundings being particularly well adapted to recreation and refreshment. These cafes are surrounded by an arcade on three sides, from which charming views of the ground can be obtained.

In this building will be exhibited all the varieties of flowers, plants, vines, seeds, horticultural implements, etc. Those exhibits requiring sunshine and light will be shown in the rear curtains, where the roof is entirely of glass and not too far removed from the plants. The front curtains and under the galleries are designed for exhibits that require only the ordinary amount of light. Provision is made to heat each part as required.

The exterior of the building is in staff or stucco, tinted a soft warm buff, color being reserved for the interior and the courts. The appropriation for this building is \$400,000. It will probably be built for something less than this sum.

The central building illustrated

THE FISH AND FISHERIES BUILDING.

THE TRANSPORTATION BUILDING.

THE HORTICULTURAL BUILDING.

is the Transportation building, which will be located next to the horticultural building. The main building of the transportation exhibit measures 960 feet front by 256 feet deep; from this will extend westward a triangular annex covering about nine acres, and consisting of one-story buildings 64 feet wide, set side by side. As there will be a railway track every 16 feet, and as all these tracks will run east and west, these annex buildings may be used to exhibit an entire freight or passenger train, coupled up with its engine. It is likely that the display of locomotive engines will be quite stupendous, for they will all be

placed end on to the central avenue or nave of the main building. As there will probably be at least 100 engines exhibited, and placed so as to face each other, the perspective effect of the main avenue will be remarkably effective. Add to the effect of the exhibits the architectural impression given by a long vista of richly ornamented colonnade, and it may easily be imagined that the interior of the Transportation building will be one of the most impressive of the Exposition. The exhibits to be placed in the building will naturally include everything of whatsoever name or sort devoted to purposes of transportation, and will range from a baby carriage to a mogul engine.

The upper engraving shows the central portion of the Fisheries building. Excluded from the view are two smaller polygonal buildings, connected with the main building on either end by arcades. The extreme length of the building over all is 1100 feet and the width 200 feet. It is built on a banana-shaped island, and the building is subdivided into three parts, to conform to the shape of the site. In the central portion will be the general fisheries exhibit. In one of the polygonal buildings will be the angling exhibit, and in the other the aquaria. The exterior of the building is Spanish-Romanesque, and will contrast agreeably in appearance with the classic style of all the other buildings.

At other times we will give views of other Exposition buildings, some more imposing than those which appear on this page.

The Lamberton Mill.

In the Lamberton ore-crushing mill, illustrated last week, the crushing is done by a group of rolling balls nine inches in diameter, and ten in number. These, as is shown by the plans, are driven round a circular, cup-shaped track by a heavy rotating disc, the great weight of which, bearing on the top of the balls, drives them round, imparting at the same time a powerful crushing effect. The material to be crushed is fed from a hopper, marked A on Fig. 1, down the hollow vertical shaft B, diverging at the foot. Falling underneath the balls C, the material gets pulverized by them.

The balls have a compound motion given them, causing them to spin or screw as they roll round, and in this way they are preserved in truly spherical form. The action being rolling, not rubbing, insures that the minimum of power is used for driving. The parts subjected to wear—the balls, track and face of driving

disc—are made of the most durable material.

These mills are made for either dry or wet crushing. In dry crushing the fan-blades and scraper attached to the revolving disc create an induced current of air down the hollow shaft B, which assists in blowing the fine material through the screens D, the fineness of which regulates the grit of the finished product. In wet crushing the water is allowed to flow down the hollow shaft B, along with feed, and washes the ground material through screens in the usual manner common to stamp batteries. The great feature of this mill is its simplicity and ease of erection. It will, it is claimed, crush 15 tons per day of 24 hours. It has the additional merit, as our sketch shows, of being compact in form.

A phenomenally rich gold mine is reported as found in the Giant range of mountains about 200 miles from Chihuahua, Mexico. The yield is said to be in wire gold.

A Concrete Building.

The members of the Technical Society of the Pacific Coast went to Palo Alto on Saturday last on the invitation of E. L. Ransome, who has nearly completed two large concrete buildings for the Leland Stanford, Jr., University. One of these is the girls' dormitory. The larger one is the museum building and is the finest piece of building concrete work yet done in this vicinity. The structure is absolutely fireproof, and intended also to be earthquake proof. It is built on the system patented by Mr. Ransome, so as to be a homogeneous structure as to walls and partitions, there being no joints. Twisted iron rods are used for additional strength where necessary. The cement is mixed in the Ransome patent mixer and elevated to points where used. A large force of men has been at work on this building for some time and it is now almost complete. Even the interior arches and ceilings are of concrete,

The stairways are made of concrete and these will be covered with marble steps. The hallways will be finished in marble over the concrete. There is no wood anywhere in the building, the window frames, etc., being of metal. The exterior is furnished with a smooth coat of cement to resemble brown stone. The heavy columns of the entrance are, like the main structure, of concrete, and the statuary to enmount the building is moulded of the same material.

There are two concrete buildings now and others are to follow. They were built by contract by Messrs. Ransome & Onghing in an exceedingly short space of time. Stone buildings of equal dimensions would have taken three or four times longer to construct.

The owners of La Dura mine, Central Sonora, Mexico, employ 400 Yaqui Indians, at \$1 per day. They are not as good as white miners but stand the climate better.

Blinn's Tin, Sheet-Iron and Copper-Plate Worker.

A New, Revised and Enlarged Edition, from New Type, with New Engravings.
One of the Most Popular Technical Books ever published in the United States.

JUST READY.

A PRACTICAL WORKSHOP COMPANION

FOR

TIN, SHEET-IRON

AND

COPPER-PLATE WORKERS.

Containing rules for describing various kinds of Patterns used by Tin, Sheet-Iron and Copper-Plate Workers. Practical Geometry. Mensuration of Surfaces and Solids; Table of the Weights and Strength of Metals and other Materials; Tables of Areas and Circumferences of Circles; Composition of Metallic Alloys and Solders, with numerous valuable Receipts and Manipulations for every-day use in the workshop. By Leroy J. Blinn, Master Mechanic. A new, revised, and enlarged edition, printed from new type, and with 170 newly engraved illustrations. In one volume, 12mo, 206 pages, price \$2.50, free of postage to any address in the world.

It having been found necessary to make a new set of electrotype plates and new engravings of this most popular book—the old one having been worn out by actual use—it was determined to have the book re-edited and to add to it, in the different departments, new, recent and necessary matter. All of the old illustrations of patterns have been retained, and new ones have been added. The portion treating of metallic alloys and solders has been entirely rewritten, so as to have a more systematic arrangement, and to bring it abreast with the best modern practice in this interesting and important field. In all the other departments new matter has been added, every effort having been made to render the entire work, in the future, if possible, even more useful to the tin, sheet-iron and copper-plate worker than in the past.

ABSTRACT OF CONTENTS.

Rules for Describing Patterns; Practical Geometry; Mensuration of Surfaces; Mensuration of Solids, and Capacities of Bodies; Table of Weights, etc.; Table of the Circumference of Circles and of the Areas of Circles; Rules for Rendering the Tables Useful; Size of Tinware; Capacity of Cylinders, and various other Useful Tables and Information; Practical Receipts, Varnishes, Lacquers, Cements, Metallic Alloys, Miscellaneous Receipts, Strength of Materials, with Tables. Index.

The above or any of our Books sent by mail, free of postage, at the publication prices, to any address in the world.

A circular of 4 pages, quarto, giving the full Table of Contents of this popular book, will be sent free of postage to any one in any part of the world who will furnish his address.

Our New and Enlarged Catalogue of Practical and Scientific Books, 88 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.

Giant Powder Fuse Cap Fastener.

The instrument represented in the above cut is a new and grand little invention, being designed to save life and limb, and innumerable lawsuits, by doing away with the dangerous operation of digging out wet and unexploded loads where Giant Powder is used in mining. The little instrument crimps the cap on to the end of the fuse firmly and absolutely water-tight. It is also used for cutting the fuse. They are neatly gotten-up of the finest cast steel, nickel plated. Price, \$2 each, or the entire instrument finished in gold plate, \$5. N. W. MOODY, Fresno, Cal.

THE RUSSELL PROCESS.

GAS WORK A SPECIALTY.**MINING ENGINEERS.****EVERETTE'S MINING OFFICE.**

Pioneer Mining Office of the Northwest Coast.

Having the largest permanent brick assay furnaces, chemical laboratory and mining office on the Northwest Coast with a collection of about 4000 samples of the ores of Alaska, British Columbia, Oregon and the Northwest Territories, and having made personal examinations of nearly every mining camp on the Pacific Slope, from California to Alaska, I am prepared to do any class of legitimate and honest mining work, such as **EXAMINING, ENGINEERING, SAMPLING and REPORTING on the VALUE of ALL MINERAL, COAL and FIRE-CLAY PROPERTIES, BUILDING STONES, EARTHES, ASSAYS AND ANALYSIS of ORES, WATERS, OILS, SAMPLES of ORE, PULPS, "ORGANIC ANALYSIS" WORK,** and in fact any work connected with the office of a first-class mining geologist and chemist. Any information mining men may desire to know relative to the **MINERAL OR COAL RESOURCES** of the entire Pacific Northwest will be honestly given. Address **Dr. William Everett**, Consulting Mining Geologist and Chemist, 1318 E Street, Tacoma, Wash.

The Explorers' and Assayers' Companion.

A Third Edition of selected portions of the

"Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.

Price, \$3.00 post-paid. Sold by Dewey & Co., Publishers, 220 Market St., San Francisco.

By J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulae as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing. Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case. Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Concentrating Belt manufactured in San Francisco; we can therefore fill all orders on short notice. The length and width of these belts are the same as is used on the Frue or Triumph Concentrating Machines, but can be made of any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen. First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight rifles also save very fine sulphurets and the quicksiver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth.

FRUE ORE CONCENTRATOR

OVER 3000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

Manufactured under Patents of April 27, 1880;

September 18, 1883; July 24, 1888;

and March 31, 1891.

Price of Plain Belt Frue Vanner, \$575, f. o. b.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (or rifflated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt . . . \$650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt . . . \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin it need be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, grantee by the Government of the United States.

Location of Works, Grass Valley, Nevada Co., Cal.
GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1888.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices.

DAVID McKAY, JR.,
[Signed] Sup't North Star and Original Empire Mining Co.
N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 1300 IN USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

FIG. 1.—KEYSTONE ELECTRIC MOTOR.

SECTION OF CONCENTRATOR.

THE CLARKSON-STANFIELD CONCENTRATOR.

FIG. 2.—KEYSTONE ELECTRIC MOTOR OPERATING AN ELEVATOR.

Electric Motors for Elevators.

An effective motor designed for elevator work is that manufactured by the Keystone Electric Company of Erie, Pa. The machine, as shown in Fig. 1, is constructed in the most careful manner, especial care being taken with the armature bearings, which are of extra length and size. The company equips the motor with either sight feed oil cups or automatic self-oiling bearings with ample cellars, so that there is no waste of oil therefrom. The motor can be connected either with elevator or hoist of ordinary construction, either by belt as shown in Fig. 2, by gearing, or coupling the armature directly to the end of the driving shaft of the elevator or hoist.

There is no rheostat or resistance mechanism used with the motor, the controlling and reversing switch being connected to and operated simultaneously with the brake mechanism of the elevator by means of the ordinary hand rope in the car or by means of any of the ordinary de-

vices used for starting and stopping elevators. The motor receives the full force of the current without injury and without any danger of the armature burning out. It runs only while the elevator is in actual use, consequently no current is used when the latter is standing still, economizing in the use of current and in the wear of the machinery. The elevator can be instantly started or stopped at any point without the slightest jerk or jar, and reversed and started in the opposite direction with perfect safety.

The company makes these elevator motors in standard sizes of 3, 5, 7½, 10 and 15-horse power, and other sizes specially built to order. In point of durability, efficiency, mechanical construction and economy of operation, they are guaranteed to be superior for this purpose, and there is a total absence of noise or jar while in operation.

MESSRS. RIGGS & TITMAN, of Josephine county, Oregon, have recently discovered what promises to be a valuable slate quarry.

The Clarkson-Stanfield Concentrator.

Thomas Clarkson, 1st Demonstrator of Metallurgy at Kings College, London, and Richard Stanfield, Professor of Engineering at the Heriot-Watt College, Edinburgh, have invented an ore concentrator which is herewith illustrated. The dry process is employed, and the action of the concentrator is based upon the joint operation of centrifugal force, atmospheric resistance, and gravitation. Referring to Fig. 2, pulverized ore is fed on to the center of a rapidly rotating disc *D*, provided at the periphery with a raised rim *R*, which is perforated by a large number of small radial holes *H*, through which the ore is thrown by centrifugal force. The particles of rich and heavy ore, by reason of their superior inertia, are thrown to a greater distance *G*, while the worthless particles are more quickly overpowered by the force of atmospheric resistance and gravitation, and thus fall short at *S*. The collection of the ejected ore is easily accomplished,

A Welch gold ore, consisting of auriferous pyrites and galena with a quartz gangue, and containing only 20 pennyweights to the ton, was finely pulverized and sized between 70 and 90 mesh. After passing through the concentrator, it is stated that the material from each compartment was assayed with the following results: No. 1 (top) compartment, 56 oz. 10 dwt. per ton; No. 2 compartment, 4 dwt. per ton; No. 3 and No. 4, barren.

VENTURA OIL WELLS.—There has been a remarkable growth in the oil industry of Ventura county during the past year. A statement shows that the Union Oil Co., which is a consolidation of four companies, has a daily output of 500 barrels. It has driven 25 new wells during the year, each flowing from 4 to 40 barrels daily. The demand exceeds the supply. The Chino sugar factory takes 150 barrels daily for fuel. The oil is delivered by carload lots at \$2 a barrel, three barrels equaling one ton of coal. There are two other companies in Ventura.

CORRESPONDENCE.

We admit, undorsed, opinions of correspondents.—Eds.

Shasta County Mining Interests.

NUMBER II.

[By Our Traveling Correspondent.]

The J. I. C. Mining Co.

Joseph Fallen is superintendent of this company's mines, which are situated between the east fork of Clear creek and Cline's gulch, four miles from French Gulch.

The vein is opened by two tunnels. No. 1 is 350 feet long with drift 60 feet long on the eight-inch to three-foot vein. The upper tunnel is 150 feet long with drift run 106 feet on the 6 to 18 inch vein. The walls are both black slate. While the vein is not as large as in some of the other mines, the ore's values more than make amends. Large crushings of ore have averaged \$100 a ton in free gold, while no ore has gone below \$50 a ton. The ores are hauled to the mine's five-stamp mill, two miles distant, to be crushed.

The Washington.

J. S. Senter is superintendent of this mine, which is about three miles west of French Gulch on the old road from French Gulch to Deadwood. The Washington is one of the pioneer mines of the State. The vein was opened and a mill erected in 1852. This old-time mill embraced all the devices for crushing the rock and saving the gold that were known at that time. The batteries were wooden troughs lined with sheet iron, with wooden shaft and iron shoes and dies. The cams were a solid log with projecting shoulders cut out of it, which were covered with sheet iron. The gold was caught principally in the battery. At that early day the need of a concentrator was felt and one was constructed, having iron riffles to settle the gold. A crank was attached which gave the table both a side and end motion. The surface ore of the Washington was so coarse, free and rich, that with this crude way of working the mine paid handsomely. About 1870, a six-stamp iron battery was put in and plates added.

Owing to the want of knowledge of the properties of cyanide of potassium, considerable trouble was experienced in coating the plates. About this time a tunnel was started from the north side of the hill through 1400 feet to the south side of the mountain, cutting the vein 200 feet deep. Only the ores that were known to exceed \$10 a ton in value were extracted for milling. All below that value was left standing. The ores milled averaged from \$30 to \$50 a ton in free gold. After that time two tunnels were driven on the vein, each 600 feet lower. The ore from the middle tunnel averaged \$19 a ton. The greater part of the ore was left standing, as it was not thought to be high enough in grade to pay for working. In the lower tunnel none of the quartz was milled, as it was not considered to be high enough in grade.

It is a question whether the lower results obtained from this ore were not due to the higher grade of the ore, this seeming "bull" being due to the fact that at this depth the greater value of the ore was no longer free and was therefore not recovered in the system of milling employed at that time. For want of satisfactory returns the mine was shut down, although there was still standing, all ready to stoep out, thousands of tons of ore but little below \$10 in free gold values, with a 2 to 25 foot vein to draw on. Thus the mine stands to-day, awaiting the coming of a man with modern ideas of mining and milling and with sufficient "sand and soap" to carry it through. Since the closing down of the old mine the owners have been mining feeders that lead to the veins. These feeders run from two inches to two feet in width. In working these feeders the owners have learned that all gold does not glitter; for, while the ores will give a fair and satisfactory return by free-milling process, the selected ores on hand for shipment, at the time of my visit, assayed \$153, \$179, \$229 and \$320 a ton, thus going to prove that the old Washington holds in her walls a vast store of wealth, far in excess of that obtained by working the old free-milling quartz.

The Niagara.

The Niagara, Wm. T. St. Auburn, superintendent, is situated immediately above the old Washington mine and about five miles west of French Gulch. The mine is opened by five tunnels. No. 5 or the lower tunnel is in 2300 feet, with no vein encountered as yet. No. 4 is 400 feet long and onto the vein which has been drifted on for a distance of 700 feet and showed 34-foot vein. No. 3 was run 220 feet and cut the vein which was drifted on 400 feet. No. 2 is 150 feet. No. 1 is 600 feet long with a drift of 500 feet. The ore from the different veins has run all the way from \$10 to \$60 a ton. The mine has a complete plant and is running 18 stamps at this time.

The Milkmaid.

J. S. Senter is owner of the Milkmaid, which is just opposite and parallel to the Washington. The mine is opened by a 100-foot tunnel that cuts the 3-foot vein about 100 feet deep. Ore from this vein has been sold to J. Bell of Shasta for reshipment for \$50 a ton. The average ore is milled in the mill of the Washington mine

and the results have been very satisfactory to the owner.

Little Gem.

Wenh Bros. are proprietors of this mine, which adjoins the Niagara. The owners have just got into the ledge, the ore of which shows well in free gold, and owing to the neighborhood, promises well.

Unity Gold and Silver M. Co.

W. D. Biegle is superintendent. The mine is located 34 miles north of Redding on the east of the Sacramento river. The property is developed by shaft and a tunnel. The tunnel is driven 125 feet with the veins. Three shafts have been put down—No. 1, 40 feet; Nos. 2 and 3, 45 feet each. The veins run from 3 to 25 feet in width. The owners claim that the ore from the 14 ledges owned by the company will average \$160 a ton in gold and silver. The vein matter is quartz with porphyry hanging and slate footwall, which in places changes to dolomite.

The mine has a Kendall mill with a capacity of 20 tons per day. The ores are treated by a process invented by the superintendent, by means of which all the waste sand is extracted and the mineralized ore concentrated. The superintendent claims that by his process 95 per cent of the ore values can be saved.

Black Bear.

This mine is seven miles west of Redding on Miletown mountain. The vein is opened by tunnel and shaft. At this time a crosscut tunnel is being driven which will cut the vein 200 feet deep. From this tunnel drifts run on the vein will cut the vein 800 feet deep. The vein in the upper tunnel is from 2 to 4 feet. The ore's value ranges from \$55 to \$2500 a ton. Jos. Bell is superintendent of the mine.

Sunny Hill.

Jos. Bell is superintendent of this mine, which is about 25 miles west of Redding, and is opened by shaft and tunnel to a depth of 200 feet. The vein runs from 2 to 4 feet and carries a 2 to 12-inch streak of ore that assays from \$200 to \$600 a ton.

Eureka Tellurium G. M. Co.

P. Scherer is superintendent of this mine, which is three miles northwest of Redding, on the south bank of the Sacramento river at Middle Creek Station. The superintendent is driving a six by eight-foot tunnel with Phoenix drills and air compressors. The tunnel is now in 50 feet with 75 feet to go to strike the vein 160 feet deep. The mine is also opened by shaft to a depth of 100 feet. The ore from the old workings assays from \$40 to \$40,000 a ton. It is the superintendent's intention to now develop the mine.

The Celestine.

The mine is in the Grizzly Gulch district, four miles east of French Gulch. L. McDonald is superintendent. The company is driving a tunnel to develop the properties. The old Iron Mask mine is being put into shape to resume operations. One of the most extensive and valuable mining sections of the county is that beginning at the Calumet mine, two miles above Middle creek, and running north to the Walker Bros.—on Utah and California—Spanish, Central, Shasta, Mammoth and Texas. These mines are in porphyritic slate. The quartz is white, with occasional ribbon streaks. The average ores carry a fair percentage of high-grade sulphurets. While some of the superintendents claim that the greater part of the ore's value can be saved by ordinary wet-mill process, others contend that only a small percentage can be recovered from the ore by wet stamp-mill process. On some of the mines the ores are given the most thoroughly exhaustive treatment. Others content themselves to sort their ores, ship the high grade for smelting, and mill the lower grade, while others again mill all of their ores. Unfortunately, the mines run along the mountain side some one to three miles from the river, thus necessitating the hauling of the ore for that distance to the mills, which are all situated on the north bank of the Sacramento river. It would look as though it would pay these mines to bring in a ditch and place their mills at the mines. If sufficient water for power and mill could not be secured, water for battery alone would suffice, as the Sacramento river would run all the dynamos and generate sufficient electric power for not alone the mines of this section, but the entire State.

The Calumet G. M. Co.

Almarin B. Paul is superintendent of this property. The company's works are located on the bank of the Sacramento river, two miles above Middle creek.

The mines are three miles distant, the ore being conveyed by tramway to the works.

The mine is operated through a system of tunnels having an aggregate length of 1000 feet on the vein and a depth of 200 feet. The vein runs from two to ten feet in width, and gives from \$3 to \$75 a ton in gold values. The gold is exceedingly fine, and therefore very difficult to save. To secure the greatest percentage of the ore's value, Mr. Paul has being erected a double-system mill, one side being for the wet treating of the low-grade ores, the other for dry working of the higher grade of ore.

The Paul Dry Process.

In this mill the ore is dried, then passed through rock-breaker to a Paul pulverizer; from the pulverizer to the Paul harrel amalgamator, where quicksilver is added and the ore amalgamated. The ore then drops into

another harrel, when warm water is added, the amalgam gathered, and the pulp discharged. From this harrel the amalgam is drawn off into a tank of Mr. Paul's invention. Here the amalgam settles of its own weight to the bottom, while the lighter quicksilver, freed of its gold, flows out through a siphon. This tank is kept under lock and key, and can be cleaned up as desired. The ore, after leaving the harrel, is fed on to a stationary amalgamating plate, then on to a vibrating amalgamating plate, over which there swings a set of iron "fingers," which serve both to distribute and agitate the ore. From these plates the ore passes on to a system of vibrating blankets, where the sulphurets are caught. Mr. Paul claims that this system will work to a higher percentage of the ore's values than any other milling process.

The Paul Wet Mill.

In this mill the ore is crushed in a rock-breaker which feeds direct to a Paul circular stamp battery of 12 stamps having a capacity of 20 tons per day. The whole system of stamps is lifted by a revolving cam, on the screw system. Mr. Paul claims that the circular battery has this advantage over the other batteries, that the feed in the circular is the same to all the stamps, and that in consequence they all do an equal duty; while in the straight battery, the end stamps do very little work. From the battery the ore flows over silver-plated amalgamating plates, then on to oscillating blankets, the ore then flows into a set of tanks and settlers where, after the ore has all settled, the water is drawn off and the ore then fed to a system of 17 "Paul Americanized Arrastras." These arrastras leave little to be desired—the bottoms and drags are moulded into shape, and composed of Portland cement and the quartz ore of the mine, so that while the drags and bottoms are grinding the ore, they in turn, are being ground up with a loss of the cement only. This system of molding the bottoms into keystone slabs, that have but to be dropped into place or as quickly lifted out, is a great saving in time, while the riffles or grooves moulded in the bottoms make the necessary pockets for the amalgam. It would seem as though nothing could escape after passing through either of Mr. Paul's processes; but not satisfied, and not bigoted, but seeking for the best Mr. Paul has investigated the McArthur Forrest process and added it to the plant of the mine. Finding it very satisfactory the officers of the company organized the Shasta Gold Ex. Co., with Mr. A. Paul as manager, and have erected a plant on the opposite bank of the Sacramento river, as before stated in this article.

The Texaco Con.

R. G. Hart, is superintendent of this mine which is just north of the Sacramento river, eight miles north of Redding. The mine is opened by four tunnels, No. 1 or the upper tunnel is 290 feet; No. 2, 300; No. 3, 350; and No. 4, 450 feet. The lower tunnel cuts the vein 650 feet deep and shows an average width of eight feet of quartz vein matter, which mills \$16 a ton on the average. The ore is conveyed from the mine to the mill, a mile distant, by the Hallidie wire-rope transmission system. The mill is on the north bank of the river, one mile below the mine, the mill is of 10 stamps with 10 more being added, which will bring the crushing capacity up to 40 tons a day. The Texas carries a good percentage of high-grade ore, carrying a large per cent of high-grade sulphurets and in some of the quartz a fine showing of visible gold. This class of ore is sorted out, and after being crushed and sampled in the company's dry sampling mill, is shipped for smelting. The superintendent and company owner, Mr. Hart is very highly elated over the excellent showing of the mine and evidently has every reason to be.

The Central Mine.

A. A. Anthony, is superintendent of the company. The Central Co., takes in the Central, Spanish and Shasta locations, and is about in the centre of the mines on the belt. The mine is opened by tunnels, No. 1 or the lower tunnel is in 450 feet and cuts the vein 350 feet deep. No. 2 or the upper tunnel is 135 feet long. The average width of the vein is six feet with an average milling value of \$14 a ton. The ore is conveyed by wagon to the company's mill on the north bank of the Sacramento river, where it is crushed in Huntington mills. At this time the superintendent is developing the mine.

Mammoth.

The Mammoth, J. H. Morton superintendent, lies between the Shasta and Texas. The developments consist of two tunnels. No. 1, or the upper, is in 300 feet; No. 2, or lower, 704 feet, both on the vein, which is cut 205 feet deep. The vein runs from 4 to 26 feet in width with an average milling value of \$18 11, a ton. The ore is hauled by wagons, 14 miles to the 10-stamp mill. In the Mammoth ores and all of the other mines on this belt there is about 14 per cent of sulphurets that go \$4 60, to the ton.

Utah & California G. M. Co.

Walker Bros. of Salt Lake are the owners and H. D. Rippeto superintendent of this property. The Walker mine joins the Calumet and Spanish. The vein is opened by two tunnels. The lower is a crosscut tunnel 500 feet long, with drift run 900 feet on the vein. The upper tunnel and adit is 900 feet on the vein. An additional tunnel has been started, which has

been driven 550 feet, with 550 feet to go to strike the vein 425 feet deep. The vein averages nine feet in width and has milled \$10 a ton in free gold. The mine's mill is 4700 feet below the mine, on the north bank of the Sacramento river. The stamps are ten in number, of 1200 pounds each.

At this time the Utah & California is being developed, while the mill is leased to the Mammoth mine.

Prospects.

In addition to the mines mentioned, there is scattered throughout the county a large number of prospects that give promise in their high grade of ore, of being of value when sufficiently developed to show their extent. While Shasta has every reason to be proud of the large veins and high milling values of her gold quartz mines, she holds in her borders the highest mine in the State in

The Iron Mountain Mine.

Camden, Magee & Sallie are the owners. The mine is on Iron Mountain, eight miles north of Shasta. The property was first located as an iron mine, but subsequently found to be rich in silver and gold. The company's property takes in one mile on the vein. It is an exceedingly difficult matter to convey an idea of the immense body or extent of this wonderful deposit of mineral. From the base of the hill to the summit, the iron crops out in irregular masses through the porphyritic slate, country rock—a veritable mountain of ore. On the side of the mountain a series of crosscut drifts have been run in to the vein, and levels driven out from these. As you walk into these drifts and ores and recesses from one to the other, with a solid body of ore above, below and on both sides of you, the supply seems inexhaustible and immense. Stepping across from one wall, I measured 250 feet, when I came to a miner drifting ahead in solid ore. Just how many feet more it will take to reach the other wall is hard to tell. Certainly the walls are 300 feet apart, and perhaps 500, and all the intervening space a solid body of ore. At no time since I wrote up the mines of Dakota, with their 300-foot vein, have I seen any thing that would in any way compare with the Iron Mountain in the extent of the ore body. The mine was opened in 1880, when it was found that the ore carried iron, copper, sulphur, silver and gold, and a mill was erected to treat the ore for the silver and gold values. The only copper saved is that which is precipitated from the mine's water by allowing it to flow through sluices filled with scrap iron.

The croppings on the lode are iron, 200 feet in width, with spurs breaking out all the way down the mountain-side. The crosscut drifts cut the vein at a depth of 80 to 150 feet. From the surface down to a distance of 80 feet, the ore is heavily charged with iron, and is called free milling. This, the cap ore, carries a larger per cent of gold than the ore underneath. At 80 feet, the ore suddenly changes, giving the appearance of a floor. From this depth down, the ore is a solid mass of sulphurets. This is so clean that a handful of the decomposed ore looks like exceedingly clean sulphurets from a concentrator.

These sulphuret ores require roasting before being added to the other ores. As you walk through the mine, which reminds one more of an immense cave, the foreman sticks a pick into the floor, every few feet, and brings up a solid body of sulphurets; or digging into the sides, shows a continuous body of ore for 400 feet on the vein and 250 feet across it. The ore extracted now is simply an assay sample in comparison. If the mine could have a year's solid development put on and in it, the property could supply thousands of tons of ore a day and keep up the supply indefinitely.

The mine has a 20-stamp silver mill; 15 stamps are run on the free-milling ore and 5 on the sulphuret.

The free-milling ores are dried in a large chute extending from the mine down to the level of the mill. From a bin, at the bottom of the chute, the ore is conveyed by cars to the mill, where it is powdered in batteries that were intended originally for wet crushing. For want of proper appliance, a vast amount of the ore is lost in the form of dust that floats up and out of the mill in a continual cloud. From the batteries the ore feeds into a bin from which it is distributed to a system of 12 pans and 6 settlers, with two-ton charges to the pan, and the ore treated for six hours, or four charges a day, making the capacity of the mill about 100 tons a day—when it should be a thousand.

The sulphuret ores are fed to a Bruckner furnace, roasted and chloridized and then added to the other ores. The product is run out in silver bullion, carrying a fair per cent of gold. The mill was first operated wet. This failed and then the present Nevada system of treatment was adopted. It would look, however, as though the surface ores could be worked to a better advantage if they were treated as at the Anaconda mine in Montana and converted into copper matte. The Iron Mountain mine is one that the owners and the county can well be proud of, and if it were thoroughly developed and equipped, I very much doubt if any mine could excel it in the value and amount of its output.

Mining Information.

In my trip up through Tuolumne, Calaveras, Amador, El Dorado, Placer, Nevada, Sierra, Plumas, Lassen and Shasta counties, I have met with the kind, courteous treatment characteristic of mining men, and I have been

pleased to find that there is no longer any hidden or secret business. Mining has long been handicapped by the refusal of the owners of good mines to give any information in regard to their properties, and in consequence the public has only learned of the "wildcat" or worthless class of mines. That day has passed and mining men everywhere recognize the fact that the business of mining needs but to be placed before the people in its true light to place it where it belongs—in the front rank of all legitimate and profitable business enterprises.

That quartz mining is coming to the front is shown by the general reopening of old mines and the development of new. Capital is constantly on the lookout for a good mine, and the miner has but to show the ore in sight to get its full value. I desire to return my most sincere thanks to all who have so kindly assisted me in my work and to assure them that if I can serve them in any capacity, they have but to address

E. H. SCHAEFFLE,
Murphys Cal. Ex. U. S. M. E.

The Phonograph.

A Theory of Sound and Vibrations.

EDITORS PRESS:—Much has been written in explanation of this mysterious instrument for the repetition of sound, but a proper investigation of its operation justifies the conclusion that the true explanation of its mysterious operation has never as yet (to my knowledge) been given, and since sound plays the most important part in its operation, it becomes necessary for a proper understanding of it therefore to have some idea of the nature of sound. This phenomenon, with which all are familiar, is that peculiar sensation which the mind experiences when substance is caused to vibrate, or, in other words, sound is an effect of the vibration of the atoms of substance.

For instance, when the atoms of any substance are put into motion, or are caused to vibrate, the atoms of the air in immediate contact with such vibrating substance are put into a corresponding vibration, and being conveyed to the brain, its substance is also caused to vibrate in a corresponding manner, and the mind (?) forms the conception of a sound produced by such vibrating substances.

But now arises the very important question, viz.: Does a sound proceed from the vibrating substance, or does the mind receive an impression only of the peculiar sensation as an effect of such vibration? If the former is the case, then we must conclude that sound is a substance, or a something contained in all things, and that it is thrown out or set free when substances are put into vibration. For instance, we play upon a musical instrument, as the violin, the strings of which are caused to vibrate, and we receive upon the mind an impression of a sound, which seems to proceed directly from the instrument; but does it? Does this something, termed sound, exist within the instrument, independent of vibration, or is it a property of matter and an effect of vibration? And when the vibration is conveyed to the brain, what gives to the mind the impression of a sound, the latter as a tangible reality having been first impressed upon the brain, or is it simply the vibration?

Now the true answer to these questions has never been satisfactorily given, for the want of sufficient evidence by which to form a proper conception of the phenomenon.

But fortunately, owing to the recent discovery by Mr. Edison of the phonograph, we are enabled by its mysterious operation in the repetition of sound to comprehend the true nature of the latter phenomenon. Again, since sound as before explained, is an effect of the vibration of substance, it is necessary, therefore, to explain the meaning or nature of vibration and the manner in which the mind is enabled to receive the impression of sound as an effect of such vibration. It is, of course, evident that vibration in effect consists in putting into motion the atoms of matter by the contact of two or more substances; when, therefore, such motion is produced in any substance, the atoms of the atmosphere immediately in contact with such vibrating substance are put into a corresponding motion or vibration, and in this manner, from atom to atom the vibration is conveyed to the mind.

An illustration of the manner in which sound or vibration is conducted from the vibrating substance, can be made with a number of balls suspended from a wire. If, for instance, we strike the first ball in the line, the motion imparted to it is immediately imparted to the next following, and in this manner by contact from ball to ball adjacent, the original motion is conveyed the length of the line and the ear at the opposite end will be made conscious of the sound produced by the blow upon the first ball, all of them, however, returning to their original position in line.

From such illustration it is evident that nothing proceeds from a vibrating substance to the ear, but like the balls, the atoms of the air, although put into motion, yet retain their relative position and do not travel onward in order to convey the original vibration. This fact we can also illustrate by the swell of the ocean, which is the vibration of water put into motion by the earth's rotation or by the winds, and although the huge billows seem to be rolling onward, yet by observation we find they do not, but that the water simply rises and falls. Or again, we drop a pebble into the water,

and from this point a continual series of ripples will proceed in a circular form, and expanding in all directions, and the ear placed within the radius of such vibrating ripples, will hear the sound of the falling stone. It will be found upon examination, however, that the water which forms these small waves does not move onward as it appears to do, but in a similar manner as the billows of the ocean, simply rises and falls.

Now, what is true of the wave of vibration in the water is true also of the atmosphere, and for each reason it is evident that no sound wave proceeds from a vibrating substance, but such vibrations are conveyed by contact of atom to atom in a similar manner as illustrated by the ripples of the water.

From the foregoing explanations of the nature of vibration, we can now form some idea of the mysterious operation of the phonograph and of the reproduction of recorded sounds. This is an instrument by the means of which we are enabled to store up for future use the vibrations of substance, and by the repetition of such vibrations to reproduce upon the mind a conception of the original sounds produced by them. All are of course familiar with the fact that there are many methods of storing force or energy. For instance, the elevation of water to a given height, and which is allowed to fall by gravity for use is an illustration of stored energy; so also is the force required in winding a watch spring, the force or energy required in winding it being stored within the spring and ready for use. Another illustration of stored vibration or of energy we find in the impression conveyed to the mind by the use of language in the expression of our ideas, when, for instance, we listen to the conversation of another, the vibration, or what may be termed the sound waves—the effects of the vibration of the vocal organs in speaking—are impressed upon the brain, and the mind is made conscious of the ideas expressed by the use of the words used for the purpose. We find that at some future time the brain matter can be put into vibration in a similar manner and the original idea is again suggested to the mind, and as a repetition of the original idea expressed. This fact we understand constitutes the faculty of memory or of recalling past scenes, events, etc. But between the operation of the phonograph and the human brain, in the manner in which it repeats previous impressions, there is a wide difference, for while the latter simply recalls again to mind the thoughts or ideas only, the former recalls not only the ideas, but repeats also, in an audible tone, the words used in the expression of such ideas.

This discovery of Edison's was the first to illustrate the possibility of storing the energy of vibration and of reproducing its effects subsequently, at pleasure; it was not therefore a discovery of some new law or principle in nature, previously unknown, but new only in its application. Now, to an observer who may be perhaps familiar with and who understands the nature of sound and how it is produced, as we have all been taught to believe, it seems but natural, and in fact, to him, as a matter of course, without question, that when the vibrations of the vocal organs, as, for instance, in speaking before the phonograph, are impressed upon the sensitive cylinder of the instrument, when these recorded impressions are again reproduced, a repetition of the original sounds as spoken must, from the nature of things, be produced as the result. As a matter of fact, such is the case, but not, as is generally supposed, from the simple fact that the sounds were previously impressed upon the cylinder, for the principle involved is an effect of a fundamental law, underlying much of the phenomenon of nature, which is as yet but little understood, or at least recognized, and it is this principle which gives to the phonograph its great mystery, that is, in apparently recording a sound and again repeating it when no sound whatever had been conveyed to or recorded upon it.

From such explanations, it is evident that no sound whatever is produced by the vibrations of substances or from the vocal organs when speaking; consequently the vibrations only of the vocal organs are conveyed to the instrument, in the manner as before explained, and are impressed upon the cylinder. Upon bringing the fine metallic point again in contact with the cylinder, and upon revolving the latter, the metallic point is again put into a similar vibration, and similar sounds, as originally produced, apparently proceed from the instrument; but if no sound were recorded there, whence comes the apparent sound? This sound is apparent only and not a reality; but the vibration is conveyed to the brain, which is put into a corresponding vibration, and the mind forms the conception of a sound and similar in all respects to the original sound produced when speaking.

What is true of the phonograph is true also with the telephone, for no sound whatever is conducted upon the wire, but the atoms of which it is composed are put into motion by the vibrations of the local organs and conveyed along the wire by the contact of atoms, as before explained, and are in this manner conveyed to the receiver at the other extremity, who apparently hears the voice of the sender of the message, but whose mind, however, in reality forms a conception only of the voice speaking, as an effect of the vibration.

It may seem to be the greatest absurdity to maintain that sound is not a tangible reality, but that it is a mental phenomenon only—a conception of the mind, for upon such a suppo-

sition we must assume that previous to the existence of life upon our planet the roar of the surf upon the rocky beach, the thunders reverberating among the clouds above, as well as the clash of worlds in the celestial regions above, were followed only with eternal silence. Yet, absurd as it may seem, and contrary to our previous knowledge of the nature of phenomenon and of nature's forces, we must accept the mysterious phenomenon of the phonograph as an evidence of the fact that no sound whatever proceeds from a vibrating substance, but that it is a conception of the mind only.

But, suggests the reader, "that your theory of sound is wrong, and that it does travel forward upon the telephone wire, is evident from the fact that the receiver of a message is enabled to discriminate between the vibrations of the vocal organs when a person is speaking in the instrument, and the vibrations of any other substance, which he could not do if sound was simply a conception of the mind." It is very true if all vibrations were of similar character the receiver could not discriminate between sounds produced by the vibration of the vocal organs in speaking or the sounds produced by the vibrations of any other substance. For this reason, if an instrument could be constructed to pronounce words in a manner similar as the vocal organs, a receiver could not distinguish them from the human voice, but an instrument of that character cannot be constructed in consequence of the peculiar nature and great number of vibrations necessary to produce the required sounds; or, in other words, that are necessary to enable the human mind to form a conception of the ideas expressed by the vibrations of the vocal organs.

For instance, language by the use of which man is enabled to impart his thoughts or ideas to others, is composed of words arranged in a proper order, while each word is composed of certain letters or symbols, and it is the peculiar vibration of the vocal organs that determines the nature of the letter and its peculiar position for the formation of a word.

Now, upon the inspection of a phonograph cylinder upon which an impression of letters and of words have been previously made, we find that such impressions differ entirely from impressions made by the vibrations of any other substance, for in the case of some simple words the vibrations recorded number many thousands; these peculiar vibrations being imparted to the atoms of the wire, which vibrating in unison, and conveyed through the length of the wire, as before explained, enable the receiver to form a proper conception of the nature of the vibration as well as of the ideas conveyed, and by increasing the velocity of the vibration of the atoms of the medium which convey the message, by the electric battery, these vibrations can be conveyed to any desired distance.

O. W. HASKINS.

Hydraulic Mines in Placer County.

In May last, R. T. Devlin, special counsel for the Sacramento County Supervisors, applied to the Superior Court of Sutter county for a restraining order against hydraulic mining at Iowa Hill and Wisconsin Hill in Placer county, the alluvions from that section emptying into tributaries of the American. The reason for the bringing of the suit in Sutter county was the law passed by the last Legislature that in no case of the kind should plaintiff be heard before a court of the county where plaintiff's residence was claimed or had.

Temporary injunctions were granted against the following companies: Washington Con., Medical Point or Del Rey, Homeward Bound, and Orient. The Circuit Court also enjoined the Golden Hope, Gleason and Orient.

A few weeks ago representatives of the claimants mentioned came down to Sacramento and invited the Board of Supervisors to go up and inspect the mines and view the ground around Iowa Hill and Wisconsin Hill, and asked that the board allow them to run their monitors for a time. There are a number of other claims in the same locality.

The Supervisors went up last week and examined the ground. The attention of the committee was called to the condition of Indian canyon at this point. It could be seen that the bottom had been filled to a great depth with debris from the mines. This they were informed averaged a depth of from 150 feet where it was dumped, gradually decreasing until at the mouth of the canyon, where it emptied into the river, there were no apparent indications whatever of mining having been carried on above.

At the Washington Cone, 20 acres of hedgerock are exposed.

"Now, gentlemen," said W. R. Morton, as reported in the Sacramento News, "I want to call your attention to the material we are working. It is very hard and is worked with great difficulty by the old pick and shovel system. We are barely able to pay expenses in this way, yet it is the only thing left us, and we must either work or starve."

"You see, we are slowly working it out, however, and perhaps in ten or twelve years we could clean up the ground. The result to you valley people would be exactly the same as if we were given permission to operate our monitors, namely, the debris will all find a resting-place in Indian canyon."

"But to us the result would be very different. By operating as we are, we could barely

eke out an existence, but if allowed to hydraulic mine we could clean up with a snug profit, which would to some extent lighten the loss of our pipes, ditches and labor expended for years in perfecting our claims for mining operations."

"Here is the proposition in a nutshell," interposed Mr. Brown. "We ask permission to do in 60 or 90 days what it would require 10 or more years to do, with to you the same result."

After looking the ground over, the canyon where the last debris had been dumped was examined and found to consist of a deep bed of exactly the same material as was found in the mine, except it was freed from the precious metal. This was acknowledged to be a clear demonstration that the cleanup was of such heavy material that a very small per cent of debris could be carried in suspension to the valley below.

A number of other mines were visited and a meeting of the committee was arranged with the representatives of the miners who desired a cleanup. This meeting took place in the evening. We quote the proceeding from the News:

The Washington Consolidated was the first called, and Mr. Sprague, on behalf of his company, asked for the privilege of a 90 days' run. "Will you then etoilete to a perpetual injunction?" said Mr. Devlin.

This was calling for an answer which only a miner who has invested his last dollar in the placers can appreciate.

After a silence, Mr. Sprague answered, "Yes, sir, we will do it."

But this was not the last concession asked by the attorney.

"Will you agree to close your mines perpetually June 1, 1892?" continued Mr. Devlin.

"No," quickly answered Mr. Sprague, "I never could agree to that for the simple reason that it was impossible with the limited water supply to secure water for 90 days."

It was further explained that the material to be removed was of such a nature that it was impossible to use water more than one day in three.

Mr. Morton explained that the strata to be worked would have to be blasted and then broken up with sledges before the monitor would do effective work.

A long altercation followed, Mr. Devlin insisting that the miners should limit themselves in time, or it might take them three years to clean up, and that it threw the matter upon the board in a bad shape. It was thus simply a matter of bookkeeping, and would result in no end of trouble. He believed that the miner's chances of being allowed to run depended upon their fixing a definite date, at which time their mines should close perpetually.

J. L. Brown could not see what difference it would make to the board whether it took ten days or ten years, provided no material other than that stipulated was mined.

"You, Mr. Devlin," said Mr. Brown, "insist upon a proposition which would place us almost in the same position we are now in. Some of our mines will be unable to secure more than ten days' water. You want to make time the essence of the proposition, while we have never made it anything else but the material to be used."

At this point Mr. Bates came to the relief of the miners, stating that he could not see what difference it made as to the time, provided they did not touch any other dirt than that pointed out to the committee.

It was finally agreed that the proposition of each mine should be made without a limiting date, allowing the miners to use water not by consecutive days, but as they were able to secure it, or could use it to advantage.

The Washington Consolidated asked for 90 days' water, 250 inches, at a pressure of 170 feet; the Homeward Bound, 30 days, 300 inches, 150 feet pressure; Del Rey or Medical Point, 90 days, 350 inches, 150 feet pressure; two Gleason mines, 120 days, 280 inches, 200 feet pressure; Sumpter, 100 days, 150 inches of water, pressure 60 feet.

These propositions were taken in writing by Mr. Devlin, after which the meeting adjourned.

"THE EVOLUTION OF ALGEBRA" was the subject of a paper read by Prof. E. W. Hyde at the late meeting of the American Association. He traced the progress of algebra from its rhetorical form in India, Egypt, Arabia and Greece through the encyclopaedia stage of the middle ages, to the modern purely symbolic form. These three stages were explained as being originally mathematical reasoning by words, next by abbreviations, and finally by signs altogether, by which the amazing progress of the past 200 years has been made possible, and the ultimate value of which remains to be determined by its future.

It is probable that the five territories—New Mexico, Utah, Arizona, Oklahoma and Alaska—will make their exhibit of their resources and products under one roof at the World's Fair. They united in a request to that effect and it was granted. Utah, however, wants to make an exhibit by herself if her legislature appropriates enough money to enable her to do so.

A big enterprise is nearing completion near Central Point, Jackson county, Oregon, whereby the Rogue river will be turned into a new channel for a distance of several miles and the bed mined. The ground has been thoroughly prospected and shows up in good shape.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

NORTH STAR.—Cor. Amador Ledger, Oct. 3: Since my last quite a ripple of excitement has occurred on account of a change in the condition of the ground at the North Star. In driving in a westerly direction the ground has become softer, the slate is of a lively nature, with about a foot of gouge. This is really the best indication they have had since the prospecting operations commenced.

El Dorado.

HARMON.—El Dorado Republican, Oct. 1: Favorable indications continue to exist at the Harmon mine, where the work of connecting the shaft with the tunnel still goes on. Good rock is found above and below, and if it continues all the way between, the company will have a ledge from 4 to 12 feet wide for a depth of 600 feet to work on, with rock running from \$20 to \$90 per ton. Gold can be seen all through the rock so far uncovered, it is said, and at the bottom of the shaft good rock is still found.

LEAF GOLD.—John Melton was exhibiting a handsome piece of gold in Placerville a few days ago which had just been found on Poverty Point by Frank Rice. Mr. Rice has been engaged for some time in working a piece of ground owned by Mrs. John Hall of this city, and has uncovered some nice little pockets lately. The specimen now owned by Mr. Melton is one of the most beautiful pieces we ever saw. It is much like a fern leaf in outline, is about an inch long, and is very bright, being only stained with iron very slightly in places.

O. K.—Georgetown Gazette, October 1: Dr. Spencer has employed Wm. Gibbs to do some development work on his O. K. Quartz mine near town. The lode was struck in the tunnel last fall, showing good prospects and promise.

DARLING.—The shaft on Darling mine is down 104 feet; at 100 feet two drifts were run on lode—one north 50 feet and one south 50 feet, with favorable results. Work of sinking is progressing. Capt. Newton is doing practical and thorough development work.

TUNNEL.—Mr. Gassman, who has been associated with A. Dow in running a bedrock tunnel in Dow's Cement Hill claim, has drawn out, when John Rich a practical miner who understands the chances for success goes in with Dow to complete the tunnel, which they calculate will tap the gravel inside of 40 feet.

VAN.—Tom Newland arrived last Saturday looking vigorous and cheerful, and resumes charge of the Van mine, which has been idle since last spring, owing to some costly litigation. Mr. Hersey, the millwright, is engaged in putting the machinery in order. He is assisted by Mr. Ascha and the boss. The pump will be working this week and crushing will begin within two weeks. We believe it is the intention to sink for a second level.

Los Angeles.

OIL LANDS.—San Diegoan, Oct. 1: It will be remembered that when Dr. Eames was attending the public meetings and discussing the question of fuel for the iron plant, and for manufacturing generally, some stress was laid upon the fact that the operated territory of the oil lands was in the hands of outside parties, who had the power to exercise arbitrary rates. An important move has just been made by a company largely composed of San Diego citizens, and which promises to materially affect this matter. This company has just effected an organization at Los Angeles under the name of the Banner Oil Co. At the organization, Hon. J. F. Kinney, a resident of the city, was elected president and general manager, W. A. Brophy superintendent, and C. S. Precher secretary. A. L. Hitchcock and W. E. Cooney, also of this city, were elected directors. Three-fourths of the capital stock has already been subscribed. In the way of oil lands, the company has secured about 1600 acres adjoining the Pacific Coast Oil Co.'s land, near Newhall, a short distance north of Los Angeles, and the work of development will begin at once. The oil will be produced chiefly for fuel, and, as a matter of course, San Diego industries will have the first call. From this source the Eames iron plant will get its supply.

Mono.

THE BODIE CON.—Bodie Miner, Oct. 3: During the past week east crosscut No. 1, 700-foot level, was extended 25 feet. East crosscut No. 2, same level, was extended 10 feet. East crosscut from No. 1 south drift, 60 feet above the 700-foot level, was extended 12 feet. South drift, 60 feet above 500-foot level, was extended five feet. There were employed seven miners and one carman, and, jointly with Mono, one engineer, one blacksmith, one carman, one watchman, one foreman, one assayer and carpenter.

THE MONO.—During the past week south drift No. 2, 700-foot level, was extended 19 feet. North drift No. 2, same level, was extended seven feet. East crosscut from above drift was extended 10 feet. There were employed four miners, and, jointly with Bodie, one engineer, one carman, one blacksmith, one watchman, one foreman, one assayer and carpenter.

Nevada.

THE WYOMING IMPROVING.—Grass Valley Union, Sept. 30: The Union of yesterday noticed the unexpected striking of a two-foot ledge in the Wyoming Consolidated ground while a drift was being run to secure air. The first pieces taken out of the vein looked well, but as the vein was opened on deeper, there was a marked improvement in the quartz, as it showed more free-gold heavy sulphurates and plenty of galena—a combination of minerals that is most encouraging with promise for the future of the mine, as it is an assurance that as greater depth is attained the ore will prove richer. The prospect is certainly a splendid one, and the lessees who are opening the mine feel as if they are going to be well compensated for their enterprise.

MACHINERY ARRIVING.—Grass Valley Telegraph, Oct. 6: Some very heavy machinery is being hauled over the narrow-gauge railroad for the W. Y. O. D. quartz mine. It will be but a short time now before the large spur-wheel will be in place, and then all will be ready to run. In the meantime, Supt. Brockington is doing good work underground, and the

mine is looking better than ever, and there is quartz of superior quality in sight to keep the mill going for many months.

Napa.

SHIPMENT OF PRECIOUS METALS.—Independent Calistogian, Oct. 1: Monday afternoon there were shipped from Calistoga to San Francisco by the Palisade Mining Co., whose mine and reduction works are three miles from town, 14,160 ounces of silver and gold, valued at over \$16,000. This amount of metal was obtained from a run of 23 days of only 12 hours each, the company not keeping the reduction works going at night. The shipment of precious metal is only one of many that have been made by the Palisade M. Co. and hence is not considered remarkable here; but it is additional proof that the hills in the vicinity of Calistoga contain silver and gold in quantities that should attract far more attention on the part of mining men than has been noticeable in the past.

SHIPMENTS OF QUICKSILVER.—During the month ending to-day, the following amounts of quicksilver have been received at Calistoga for shipment to San Francisco: Napa Con. mine, 395 flasks; Great Western, 109; Bradford, 79; Sulphur Bk., 97. Total for month, 680 flasks.

Placer.

GRAY EAGLE.—Placer Herald, Oct. 3: Wm. Northwood, of near Forest Hill, made us a pleasant call last Monday. He informs us that the Gray Eagle mine has been troubled considerably with water lately, but they are now putting in new and larger pumps with a capacity sufficient to handle all the water they have or are likely to have.

BONDED.—The Hoagland & Peal quartz mine, about two miles from Emigrant Gap, has been bonded for \$20,000. This mine, we understand, has turned out considerable money and gives promise of proving a big property.

San Diego.

THE STONEWALL IN BONANZA.—San Diego Union, Oct. 1: It was rumored Friday about town that the Stonewall mine was again in bonanza, a large vein of quartz averaging 20 feet in thickness having been discovered in the hanging wall country, about 60 feet from the old workings. The vein was discovered some weeks ago on the 200-foot level, since which time crosscuts from the 100-foot and 300-foot levels have been driven in, discovering the same immense mass of rich gold rock. The shoot is now known to be 200 feet high and may be assumed to be equally long. This would represent at least 60,000 tons of quartz, or sufficient to keep the mills running night and day for three years. If the quartz runs \$20, as stated, the Stonewall is certainly in bonanza. Another story in circulation last evening was that the property had been placed in Chicago for \$1,500,000. Negotiations were begun some time since and have only recently been closed. If these things are true, Julian is on the high road to a prosperity heretofore unknown.

THE BANNER DISTRICT.—San Diego Union, Sept. 1: Deputy Constable Harry Place has returned from an official trip through the Banner mining district and reports business booming in that locality. A number of new claims have been located and rich leads discovered in mines now being worked. The Banner people are confident that their district is as prolific in the precious minerals as any locality in Southern California, and are determined to demonstrate the fact in a practical manner.

REOPENING A MINE.—William A. Roberts, a mining engineer of Los Angeles, who a short time since leased or bonded the Santa Fe mine, owned by Wm. Steel, which is located about seven miles west of Perris, is making preparations to reopen the mine, which years ago produced a large amount of gold, the rock being worked by Mexicans. The remains of upward of 50 arrastras can still be seen near the mine. Mr. Roberts will pump out the mine and continue a new shaft down to an ore shoot known to exist at the north end of the property. The quartz is quite rich in gold and is perfectly free milling.

Shasta.

GLADSTONE.—Shasta Democrat, Oct. 1: Very recently a rich strike was made in the Helena, one of the group of the Gladstone mining property. This property is developing immensely under the able management of Supt. Clark. The Gladstone is now rated as one of the best dividend paying mines on the coast.

Sierra.

WIDE AWAKE.—Mt. Messenger, October 3: The Wide Awake mine is coming out splendidly. Last week it paid \$40 to the pick, and the owners are well satisfied with the appearances for the future. The Extension Co. will open its new hoarding-house at the new tunnel, Sunday. It is reported that gravel paying \$6 to the small carload, has taken from the Thistle shaft.

Sliskiyou.

GRAVEL.—Yreka Journal, October 1: The gravel found in the bottom of the shaft at Yreka Blue Gravel claim, is getting softer and prospects some gold. The shaft is down over 115 feet, and the bedrock certainly cannot be much deeper from the surface. Lee, Lash, & Co., of the Greenhorn Blue Gravel mine have reached the pay channel again from their new shaft, and find exceedingly rich prospects, but the bedrock is much lower, requiring the shaft to be sunk deeper for drainage. They will probably be obliged to go down considerable farther, or to a depth of about 90 feet in order that the steam pump can dispose of the drainage to permit working of the pay channel. The mill of the Mountain Laurel quartz mine, owned by the Ball Bros., has been fixed up in good style by the well known Fort Jones millwright, John Hopper, and is now kept steadily in operation crushing very rich rock from the dumps of the two upper levels. A third tunnel is now being driven, and if the ledge is tapped on this lower level, the mine will be worth a million. The owners have been offered half a million, but wanted \$600,000. The ledge is about 12 feet thick, and of fabulous richness, with quartz enough in sight to last 25 years.

COAL.—The prospecting with diamond drill at Willow Creek, by the Siskiyou Coal Mining Co., has reached a depth of about 200 feet, finding plenty of coal, together with securing an artesian well, raising water some nine or ten feet above the surface. The drill holes an inch hole, and the sheathing is of two inch pipe, hence the larger pipe does not afford as much force to the water as an inch pipe would. The men employed are now

taking out coal and expect to secure a large supply for use in the county and shipping to the surrounding country, as it is claimed to be equal to any of the coal now in use for stove and boiler use. The mine will be worked by running an incline, and hauling the cars out with loads of coal by the use of stationary steam engine upon the cable method. The company expect to be able to furnish coal in large quantity before winter sets in, and believe it will be much cheaper than wood, the price for the coal being placed at \$7 per ton at the mine, a rate about equal to the price paid in New York and other places near coal mining regions.

BEDROCK.—Siskiyou Telegram: G. A. Barr of the Sacramento mine, Willow creek, was in the city this week and informs us that they were now in 185 feet along the bedrock. The rock is perfectly level at present and prospects well, but when they strike the rim, which they daily expect to, they expect to unearth a bonanza. Other parties from Sacramento will arrive in a few days and will push operations vigorously.

COAL.—John Silsby, superintendent of the coal mine on Willow creek, was in the city for a couple of days this week and informs us that they are now running an incline and expect to reach bottom in four or five weeks. They have already four or five feet of coal.

Trinity.

EAST FORK.—Trinity Journal, Oct. 3: H. Junkans, who returned from East Fork Thursday, informs us that the North Star mine is looking very well, but water is a little scarce. They are not able to run the mill to its full capacity for this reason, but are running day and night and doing pretty good work. The Thanksgiving mine looks better than ever, but owing to the fact that some of the rings broke before the new ones arrived, not a great quantity of ore was put through.

PROSPECTS.—There have been several encouraging prospects found on the Lower Trinity and Willow creek. The new finds are in placer diggings and quite a number of Humboldts are interested in them. Development work is now being prosecuted.

Tuolumne.

BONANZA LEASED.—Tuolumne Independent, October 3: The Bonanza mine has been released for a term of three years. M. B. Harriman has secured 3/4 of the lease, and will consequently be king-bee in future operations. The balance of the old partners, J. P. Dart, D. R. Oliver, E. Keil and A. P. Johnson, will probably be permitted to resume old relations, and share in future "good dabs," of which there are doubtless many more left in bank.

NEVADA.

Montgomery District.

THE GOLD MINES.—Cor. Belmont Courier, Oct. 1: The first mine inspected was the Chispa on which three shafts are being sunk and levels run. Shaft No. 1 is down 50 feet and connected with No. 2 by drift. No. 2 is down 100 feet and connected at 50 feet with No. 3 with drift, and a drift is being run at 100 feet also to connect with No. 3. No. 3 is down 70 feet and being pushed as rapidly as possible for a connection on the 100-foot level. In all the workings ordinary shafts and drifts have failed to remove the ledge, and at the station where room was made for windlass, at least 12 feet of ore were taken out and then did not reach the limit. Samples taken across the mine at bottom assayed over \$70. That is above the average claimed for the mine. But they claim an average of over \$20 for the entire mine, which is very flattering, and is one of the finest properties I ever saw. The Second S. W. extension of Chispa has one shaft down 28 feet in good ore and looks fine. The work is being done by McDonald who owns an interest. The Mammoth owned by Roht, Montgomery & Co., has one shaft 50 feet, and drifting and sinking on a good ledge 12 feet wide, all of which prospects well. Two shafts are being sunk on the Wide West mine by Mackay Bros. The ledge is well defined, and prospects and assays with the average of the camp. Shafts 20 feet deep. Two other claims are being worked, but time would not allow a longer stay to see them. All the claims look first class, and snob others will be at work in the camp on at least four other claims. The affairs of the Chispa are at present managed by Wm. Bartlett from Eureka, who has purchased an interest.

Tucacora District.

INDEPENDENCE.—Times-Review, Oct. 2: North shaft sunk two feet, completing the necessary work. ELKO CON.—East crosscut from bottom of incline extended two feet in very hard rock.

COMMONWEALTH.—Second level—North drift from No. 3 chute extended 10 feet in low-grade ore. NEVADA QUEEN.—South drift from second level Commonwealth extended 25 feet, still shows bunches of ore and water coming in the face.

NAVAJO.—The stopes are yielding the usual amount of ore. The pumps are working well and handling the water easily.

NORTH COMMONWEALTH.—Second level—North drift from No. 1 raise has been connected with south drift from joint raise, distance 60 feet. Have started to open up stopes between the two raises.

BELLE ISLE.—No. 2 stopes are yielding the usual amount of good ore, and as soon as the raise in No. 3 is connected with the North Belle Isle drift on the 250-foot level, No. 3 ledge will be ready for stopping. The North Belle Isle crosscut is daily expected to cut No. 3 vein on the 450-foot level, and as soon as this is done, the Belle Isle will drift south on the ore.

NORTH BELLE ISLE.—No. 3 drift from the south line crosscut on the 400-foot level has been extended six feet, all in rich ore of about six inches in thickness. Have commenced cutting out for a winze near the face of No. 3 and will sink to the 450-foot level of the Belle Isle on this rich vein. The upraise from No. 3 has been extended 14 feet and is still showing fine ore; total height, 91 feet and 31 feet yet to go to a connection with the 250-foot level of the Belle Isle. On the 250-foot level of the Belle Isle have started a drift to connect with the top of this raise, and hope to make connection in about ten days. Line crosscut on the 450-foot level of Belle Isle has been extended 28 feet, and it is expected to reach No. 3 vein at any moment. South intermediate above 500-foot level extended eight feet and yielding good ore.

Pioche District.

FIRE.—Pioche Record, Oct. 1: Tuesday morning

at one o'clock a fire alarm sounded by the smelter whistle and the town bell brought out the populace on the double quick to find the surrounding country illuminated by a large fire at the smelter grounds north of town, and the general belief was that the whole plant was going up in smoke. Hastening to the scene, it was found that the assay office was the building undergoing destruction, and that the main works were in no great danger. The loss is something over \$1200, all the scales, etc., and supplies being lost.

FURNACE NOTES.—A stone foundation for a new assay office on the old site is about completed. It took 94,000 bricks to build the smokestack at the new smelter. The addition to the main works on the west side is being extended so as to include a dryer, which has just been erected there. The track at the scales has been raised 18 inches, extending altogether about 150 yards, to make it more nearly level with the ore bins. Buildings are to be brought from Dry Valley to replace the assay office. A second start was made at the furnace last Monday morning, this time with everything in readiness, and with the best results. Three hundred or more bars of bullion have been dipped, and the furnace continues to run smoothly. Work of finishing up the other stack is in progress, and it, too, will be set in operation as soon as ore sufficient for two stacks can be got in, which, however, will not be until the Jack Rabbit road is completed. This will require three weeks time yet. The grade will be finished through by to-morrow night, when it will require 15 days or more to place the rails. Another locomotive has been ordered, one of greater speed and strength than that now in use. It is expected to arrive during the next two weeks.

ARIZONA.

RICH ORE.—Silver Belt, Oct. 1: Chas. Ruckelhausen was in from Quartzite Thursday and brought with him some very rich ore for shipment. His mine is looking well. The production of bullion by the Rescue S. M. Co., for the 12 days ending Sept. 24th, was seven bars of about 80 pounds each; total shipments, 37 bars. A visit to the Rescue mill on Sunday last showed a pleasing condition of activity and success. Under the careful supervision of Paul Johnson, the work of reducing the ore and extracting the precious metal is progressing finely, and about 6000 ounces of silver are produced weekly. There is said to be a splendid showing of ore in the mine. An immense amount of surface work has been performed by the Old Dominion Copper Co. recently. Grading for the new smelting plant has been finished and the cable tramway will soon be stretched. Simon Billing Jr., who was in town a few days since from the Woodville mine, gives a very favorable report of that property. It is producing rich ore in quantity.

COLORADO.

THE GRAND CENTRAL SOLD.—Ass'd Press Dispatch, Oct. 1: The Grand Central mine at Kingstons was sold in Denver last night by Thos. O'Neill, its owner, to an English syndicate for \$1,000,000 cash. It is a low-grade property, running 10 to 20 ounces silver to the ton and 10 per cent lead. It is impossible to give clear titles to property in that locality, so a 99-year lease was given, which is practically a sale. The syndicate will build a 16-mile narrow-gauge road from Lake Valley to the mill to handle the ore. O'Neill goes to London Saturday to dispose of two mines located in the State of Durango, Mex.—the Avence, which has produced \$1,000,000 of silver, and another which has 2,000,000 tons of ore in sight. He will place each one at \$4,000,000.

IDAHO.

ATLANTA AGAIN LOOMING UP.—Elmore Bulletin: Pete Anderson, a gentleman well known on Wood river and Eastern Nevada, came to the Bar from Atlanta last Saturday and dropped into the Bulletin office for a chat. The Lum Burge claim is on an immense ledge, and immediately adjoins the once famous Monarch mine, from which millions of gold and silver was taken years ago. The shaft, recently sunk, is 65 feet in depth, in and surrounded by fair paying ore for the depth of 50 or more feet, at which point rich stringers were encountered. At the 63-foot level a 10-inch vein was found that averages \$2000 in gold to the ton. Here sinking was discontinued and a drift commenced, following the rich vein, which, when Mr. Anderson left the mine, was increasing in quality and thickness, and which it is hoped may lead to a chimney of incalculable wealth. They are assorting the rock and hope to make a small run of the best quality of ore at the Tahoma mill before the season closes. Mr. Anderson brought here several specimens of ore from the Lum Burge that are beauties indeed—being composed mostly of shining gold and black silver. George Tims is diligently prosecuting work on his Jessie Benton mine and with satisfactory results. Colonel Miller has resumed work in the Tahoma mine and is again extracting ore from this old reliable producer. Browne is pushing development work in the Last Chance and getting great encouragement in the shape of rich stringers of ore. Superintendent Oglesby is showing the tunnel toward the Big Lode at good speed, and hopes to tap the ledge before many more weeks shall have passed.

THE FLINT DEAL CONSUMMATED.—De Lamar Nugget, Oct. 1: The Chicago parties who held an option from Mr. Leach on the Flint property were on the ground last week and announced that they would take the property, which will be transferred to them as soon as the papers can be prepared. The price paid is \$500,000. They did not wait to return home before making arrangements for extensive improvements, but wired an order for 20 more stamps, in order to get them running before winter, and have arranged to put more miners on. With the exception of the De Lamar sale, this is the biggest mine deal made in this county for several years. As it follows the resuscitation of a moribund camp, it means more for the mining industries of Owyhee county than any transaction which has taken place in the county for a long time past. The success of working these ores by a cheap process of concentration will put new life in other districts. South Mountain has already felt the effect of this, and properties there have appreciated in value very materially. That dormant district is now being sought after, and a number of capitalists and specu-

ators have already been on the ground and deals are now on the tapis which, if carried through, will revive that camp before winter.

MONTANA

AT BUTTE.—*Inter-Mountain*, Oct. 3: In and about the mines of Butte, there are more men in the employment of large companies and on leases right now than there were five years ago, including the Anaconda group of mines that were in operation at that time. To-day there are big mines in operation that at that time were known only by the location notices. If every idle mine were in full and active operation at this moment, the same complaint of dullness would be heard of among some. The closing down of the Anaconda and Chambers syndicate properties may have retarded the progress of the camp somewhat, but to-day the business of the camp is greater, and more men find employment than when the Anaconda mines were in the full bloom of prosperity.

THE SILVER BOW MINE.—The west shaft of the Silver Bow, No. 1, will be completed in the 700 on or about the 20th of this month. This is one of the big mines of the camp, and it is so known at this time. The hoist is capable of sinking to the 1000 with ease.

THE PARROT COMPANY.—The boys in the Parrot mine are again in their glory, or at least some of them. The large shaft of the old engine, after years of hoisting, has at last given way and parted, and the big engine that was recently put in position will be brought into use by next Monday morning. The cables have arrived and are already on the reel, and the engineers will have to take the next two days in running the cages through the shaft in order to become accustomed to it before Supt. Tibbey will allow a man on the cage. Great care is practiced in this mine, more so than in any other. Drills must be put in cars and not allowed on a cage, rather than the lung ones, and the miner having them must have none other than himself on the cage at the same time. It is prohibited for any one to either go down or come up the shaft with timbers, and it is strictly against the rules for any one to ride upon a loaded car.

THE ANDERSON.—The Butte and Boston Company has leased and bonded the Anderson, that lies between the Northern Pacific side track and the Parrot schoolhouse. This is in a most favorable position, and as an old miner stated, "this whole flat is mineral."

NEW MEXICO.

GOLD HILL.—Silver City *Enterprise*, Oct. 3: J. J. Keister is in from the live little camp of Gold Hill and reports mining interest on the boom in that section since the Reservation has been turning out so well. The Reservation is keeping her record as a producer. C. S. Kellum recently had ten tons of ore worked, which netted \$50 per ton on the plates, besides the concentrates. Dolan & Sullivan have a nice pile of ore on the dump ready to be milled. Their ore has averaged from \$80 to \$100 per ton net. George Hughes has a lot of ore ready for the stamps which will run well. Henry Kule has a fine showing for ore, and has a large amount ready for the mill. Uncle Dave Eggleston is taking out first-class ore, and all his mines are showing up well. Colonel Pritchard is working on the White Signal. J. M. Gaddis is getting his custom mill ready for business. Frank Kennerston has returned from Pyramid and has opened up business at the old stand. The camp is rapidly taking on metropolitan airs.

OUR NEW MINES.—While business is naturally dull everywhere, by reason of money being tied up in transportation of crops, the flourishing state of Grant county, and more especially the mining industry, as evidenced by the many new producing mines opened within the last year, confirms the assertions before made by the *Enterprise* that the mining districts are not half prospected, and the mines already discovered only need development to make them the equal of any in the world.

UTAH.

THE BIG DALY WEST.—*Park Record*: Although ground was only broken on the Daly West property one month ago Thursday, a great deal has been accomplished and the works, under the personal supervision of Mr. J. J. Daly, are rapidly approaching completion. The shaft is going down rapidly, even if hoisting is being done by means of a whim.

THE LUCKY BILL.—The vein encountered in the Lucky Bill about two weeks ago has been drifted upon some 50 feet, and shows a steady improvement as the drift approaches the old shaft. This is strong indication that the ore chute, known to exist in the old workings, goes down and that a mine will be found at no distant day.

THE MORNING STAR.—This property is steadily improving, and at present gives every indication of making for its lessors a handsome bank account. The shaft is now down something over 100 feet, and a crosscut has been run south to the vein, which still shows up good and strong and carrying a splendid grade of ore. The vein in the Morning Star is very strong and carries about 14 inches of fine ore, and gives every indication of becoming larger and better as depth is attained.

CAMP CROSSCUTS.—The raise being made in the Alliance is progressing very favorably and at present gives splendid indications of opening into a body of rich ore. The Union concentrator has not been running at full force this week, owing to some repairs being made. The chief cause of the lay-off has been the placing of a new set of rolls. White & Macdonald have completed their contract on the same piece of work. Operations were begun this week and the contract will be crowded. The Marsac will make no more shipments of sulphides, but the metal will be stored until the refinery is ready for operations, when it will be refined and sent to market. There is quite a large amount of sulphides on hand at the present time, as no shipment has been made for nearly three months. Last week's ore and hulsion shipments from Salt Lake were the largest of any week during the present year. The increase was due to a large shipment of Ontario hulsion. The output from this mine is tremendous when both its ore and hulsion shipments are taken into consideration.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING, Sept. 29, 1891.

- 460,462.—REFLECTING LIGHT—W. J. Burke, Seattle, Wash.
460,198.—CAR COUPLING—M. Clausen, Golden-dale, Wash.
460,429.—INSECT GUARD—S. W. Conrad, Hanford, Cal.
460,430.—WINDMILL—Conrad & Lake, Hanford, Cal.
460,177.—BUILDING BLOCKS—Jerry Cook, Monterey, Cal.
460,371.—WAVE POWER—J. M. Dyer, S. F.
460,127.—WOOD-TURNING LATHE—S. N. Goldy, S. F.
460,230.—PIPE WRENCH—G. Gunnarsson, S. F.
460,390.—WATER MOTOR—W. B. Higgins, S. F.
460,444.—REAMER—W. W. McGregory, Pasadena, Cal.
460,395.—HAT-PRESSING MACHINE—M. Mellitzer, S. F.
460,212.—SICKLE GRINDER—E. D. Middlekauf, Stockton, Cal.
460,183.—VEHICLE WHEEL—H. Rohrer, San Diego, Cal.
460,184.—WAGON TIRE—H. Rohrer, San Diego, Cal.
460,365.—STILL—C. L. Schaltz, S. F.
460,223.—PUMP—C. P. Smith, S. F.
460,227.—INSECTICIDE—R. Wheeler, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

WAVE POWER.—James M. Dyer, S. F., assignor of one-fourth to Agostino Sciaroni, Newtown, Cal. No. 460,371. Dated Sept. 29, 1891. This is a novel means for applying the motion and force of the waves, and in transmitting this motion and converting it into a rotary motion which can be applied to machinery for various purposes. One way of applying the force is this: A float to rise and fall with the motion of the waves is attached to hawsers near the center so that the float will stand in a line with the line of movement of the waves. This float is of such a length that one end will be raised by the wave, while the other sinks into a depression between the two adjacent waves, and in this way the float will be caused to oscillate, each end alternately rising and falling as the waves pass beneath it. A framework attached to the float extends transversely across the points where the waves pass beneath it. The ropes pass around drums which are mounted upon a shaft, turning loosely on the shaft and having a pawl and ratchet mechanism, the ratchet being secured to the shaft, and the pawls pivoted to the sides of the drums. The ends of the ropes, after passing around the pulleys, are attached to the weights, which will always exert a tension on the ropes to cause them to move around the pulleys, when the strain which is brought upon them by the float is removed.

In another form the float is connected directly to the framework and this framework is pivoted or fulcrumed to a piling or structure which is permanently fixed at such a point that the float will lie upon and be actuated by the waves, and will transmit its motion through the oscillation of the framework. In this case the ropes extend from the ends of the timbers of the frame, which are at right angles with each other and pass around the drums and operate in the same manner as first described. The alternate oscillations of the framework act to give the shaft nearly or quite a continuous motion. By the application of a sufficiently heavy fly wheel the inventor is of the opinion that the motion could be kept up during the slight intervals between the oscillations of the ends of the float and the ends of the attached framework to which the ropes are attached. The pawl and ratchet, of course, only allow the shaft to rotate in one direction.

PUMP.—Clayton P. Smith, S. F., assignor to the American Pump Manufacturing Co. of California. No. 460,223. Dated Sept. 29, 1891. The object of this invention is to provide float or hingeless valves with a free opening for the passage of liquids or fluids which are to be pumped, and a means for guiding and controlling the movements of the valves. The valve is simply a round disk which, when closed, fits closely upon the flange around the inner passage, and when it is opened by the inward flow of the material caused by the rise of the piston, it is only checked by its contact with certain pins or lugs. When the valve commences to rise, the rear edge of it will come in contact with the lower pin or lug and the other edge continues to rise until the valve stands at an angle within the passage, this opposite edge being checked by another pin higher up. There are no hinge-pin or journals and the valve is perfectly free to turn about and change its position, so there will be no more wear upon one part than another. Several other means of accomplishing the object are shown in the patent. These valves are particularly effective in pumping thick or heavy liquids.

STILL.—Carl L. Schaltz, S. F. No. 460,365. Dated Sept. 29, 1891. This invention relates to certain improvements in distilling apparatus, such as is employed for the extraction of brandy or alcoholic products from wine or other material containing it; and it consists in certain attachments to the still, whereby the wine or other liquid may be deprived of the aldehydes and other ethereal and objectionable substances which are usually carried over with the brandy, or other distillate, and which are injurious thereto. It also consists in an attachment by

which the inventor is enabled to determine what proportion, if any, of alcohol remains in the residue which is discharged from the still.

BUILDING BLOCK.—Jerry Cook, Monterey. No. 460,177. Dated Sept. 29, 1891. This is a hollow building block provided with parallel ribs upon the bottom, inside of the sides thereof, end portions having corresponding grooves or channels, one of said ends having a dovetailed rib and the other a corresponding slot, and the transverse partition joining the sides between the ends. The block or brick is made of any desirable size and of any material which has sufficient strength to prevent the projecting locking lugs or spurs from being broken off in handling. The wall may be made up of these blocks, and by means of the dovetailed grooves and ribs the wall may be laid up very rapidly, and it may have any desirable thickness, the space between the inner and outer blocks which form the wall being left open, and these outer and inner sides may be connected by blocks extending across from side to side and firmly united by means of the dovetailed grooves and ribs at their ends and in the sides of the corresponding blocks of the wall. The wall, being hollow, presents good opportunities for ventilation, and the weight of a wall constructed in this manner will compare favorably with that of a wall composed of solid blocks or other material. The inventor finds that cast iron is a very suitable material for the peculiar building blocks.

INSECTICIDE.—Richard Wheeler, S. F., assignor to L. J. Wheeler and E. H. Gould. No. 460,227. Dated Sept. 29, 1891. This invention relates to an improved insecticide and fungicide, and the preparation thereof, so that it may be transported and stored in solid form, while at the same time being susceptible of solution and reduction to a liquid form when it is to be used. In preparing the compound, the inventor subjects the ingredients to a certain degree of heat for a considerable length of time, so that it may be poured into molds, where it will immediately stiffen and become solid and in a condition for convenient transportation or storage. At the same time it is not so hard as to make it difficult to break up and dissolve, when desired for use.

Mining Companies' Financial Standing.

The following is the financial standing on the first Monday of the present month of the mining companies listed on the two exchanges in this city:

Dr.	Cr.	Dr.	Cr.
ARIZONA MINES.	Gould & Curry...	\$10,431	
Crocker.....	Dr. Or. Hale & Norcross...	\$54,128	9,258
Locomotive.....	\$ 912 Julia.....		2,240
Peer.....	361 Justice.....		3,381
Peerless.....	1,143 Kentucky.....		13,281

Crown Point.....	354 N. Commonwealth.....		15,000
Exchequer.....	6,810 MISCELLANEOUS MINES		
518 Sierra Nev.....	19,628 Europa.....		32,621
	718 Holmes.....		42,816

Holmes has unsold bullion amounting to 8795 ounces. Occidental has bullion amounting to \$540,89. Con. Cal. & Va. has bullion on hand amounting to \$25,039.01, with further shipments to arrive. Nevada has \$12,800 due on pumping account. North Belle Isle has \$344.80 due. Del Monte has \$1312.50 due. North Commonwealth has \$1312.50 due.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

WILDERNESS G. M. Co., Oct. 2. Capital Stock, \$5,000,000. Directors—A. J. McGovern, J. W. Smith, C. K. King, E. M. Gibson and E. W. Woodward.

CONSUMERS FUEL, FEED AND TEAMING CO., Oct. 5. Capital Stock, \$50,000. Directors—Hugh Flynn, F. F. Latson, Geo. H. Hunt, F. H. Ellis and John L. Howard.

MEXICAN IMPORTING CO., Oct. 7. Capital Stock, \$1,000,000. Directors—A. C. Williams, C. F. Low, E. G. Morales, W. N. Dimmick, B. B. Williams, A. G. Eels and S. S. Mackenzie.

PRENTISS CO., Oct. 8. Object, to deal in real estate. Capital Stock, \$5,000. Directors—A. L. Stone, J. W. Young, C. W. Prentiss and H. T. Mayo.

TEPEZELA M. Co., Sept. 29. Location, Mexico. Capital stock, \$10,000,000. Directors—J. L. Rathbone, Geo. E. Ames, Geo. F. Beveridge, Anthony Bray and J. W. Pew.

EAGLE FISHING CO., Sept. 29. Capital stock, \$200,000. Directors—C. W. Preiss, Chas. A. Wagner, L. M. Furman, J. H. C. Prien and Louis Schmidt.

WORLD'S FAIR TRANSPORTATION CO., Sept. 30. Object, to furnish transportation from California to Chicago and back during the World's Fair in 1893, and also hotel, living and other accommodations at Chicago. Capital stock, \$1,000,000. Directors—John P. Irish, S. G. Haversole, T. B. H. Stenhouse, John Conley, W. H. Quinn, A. S. Keal, J. E. Shawhan Jr., C. Hanlon, J. W. Collins, A. Godhe and G. B. Warren.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

R. C. HOAG—San Francisco.
J. G. BAILEY—San Francisco.
F. K. MERRITT—San Francisco.
J. T. AUSTIN—Frisco, Cal.
Geo. WILSON—Sacramento, Cal.
J. H. CROSSMAN—Perris, Cal.
CHAUNCEY A. DAYTON—San Lucas, Cal.
G. R. GILL—Cambridge, Cal.
WM. T. HALL—Cloverdale.

Mining Share Market.

Mining shares the past week gravitated under cross-orders to lower figures up to Monday afternoon when, after cleaning the market of all stocks on a margin that it was possible, a firmer tone set in resulting with a sharp advance the next day of from 10 to 20 per cent. The rise brought in more sellers, and to accommodate legitimate sellers lower prices were quoted. The lowering of quotations through cross-orders had a stimulating effect on outside sellers, who parted quite freely with the few shares they saw a profit in. The market acts very decidedly as if the pool was going to force some of the shorts to fill, after which break prices at such a break-neck speed it will be quite impossible for the larger short sellers putting out stocks at the advance. There is no use of attempting to deny that the confidence in the honesty of the mine managers is totally destroyed, and under this condition it is hard to get in buyers on a raise. The few of the chronic traders have been taught to take their profit whenever it appears in sight; it is only by such a course they are able to keep even. The outside feeling is well illustrated in an editorial in the last issue of the *Independent Callistogian*, from which we excerpt the following:

Mining men of California who are competent and possess ample wealth to engage in the work of mining extensively, care very little for a good prospect or mine away from the Comstock lode in Nevada. They are not looking for investments where honest, straightforward transactions are necessary for success. They prefer temporary investment in some incorporated mining company, a majority of whose stock a coterie of these worthies obtain by "hook or crook" at a few cents per share. They then have control, elect themselves—or their dummies, officers—then increase the price of stock by manipulation at the San Francisco Mining Stock Exchange boards, sell their holdings at an advance, then levy an assessment to obtain money to work the mine or mines they control, run prices down, buy their stock back again for a few cents per share, and during these operations escape even the payment of a dollar from their own funds, the general public, the "outsiders," the "lambs" paying all expenses of working the mines. This is repeated year after year, and yet the worst has not been told. These opulent mining men not only do not pay anything for working the mines they control, but they actually steal outright from one-half to all the metal taken from them. These are facts well known to many people, particularly old timers.

Notwithstanding such scorching editorials as the above, which are, without doubt, the reflex of public opinion, the writer believes that the pool, through cross orders or otherwise, will create higher prices, but it is not likely they will be able to sell much, yet by advancing quotations they can make the shorts fill.

The suit of M. W. Fox against the Savage Mining Co. is to come up before Judge Hebbard, New City Hall, on next Tuesday. Interesting developments are looked for. Stockholders who can attend the trial should be on hand.

F. B. Logan, formerly correspondent for this paper and who is considered thoroughly reliable, writes as follows from the Quijota District to the *Arizona Citizen* of a recent date, regarding the mines there. "In 1884 the present owners got possession of the mines and a shipment of 50 or more tons of very rich ore raised an excitement, which brought the rush of people. Nearly 500,000 was extracted from the Peerless and Crocker mines. Mr. Pickett is now laying in the largest amount of supplies ever provided since the palmy days, and is preparing to make another run on the Peerless, and also the Peer, which he believes will prove the best mine in the group. He has assays to justify this conclusion. He proposes to let some large wood contracts soon. Burley drills are being employed to thoroughly prospect the property, and at the same time a small force of men is engaged in stoping, which is soon to be increased, whereupon the mill, which is a 20-stamp, will be started up again.

From the Comstock mines the news continues interesting and important. The west drift in Mexican near the Ophir line, on the 1465 level, is being closely watched, and good results are confidently looked for. From Union and Sierra Nevada nothing new comes to hand. In Con. Virginia the management expects to be able to show up several levels to the west. The work for months past, or since the rich strike on the 800-foot level, has been to get the other levels in good condition for taking out the ore which is known to be very high grade. The only difficulty that now appears to be in the way is the claim of West Con. Virginia to the west ledge. The latter's ground is patented. In Hale & Norcross and also in Savage the developing work is continued. In the former they are raising ore to the surface. The work in Potosi and Bullion, which is being lost sight of, is quite important, as is that in Con. Imperial on the 1100-foot level. A strike in this mine would revive interest in the adjoining mines. They appear to be getting the water down in the south end Gold Hill mines, so that work can be resumed soon on the levels where rich ore is known to be. It will take time to repair and get the old drifts, etc., in shape. When Overman's assessment is delinquent, it will be in order to give out better news from that mine.

From the Tuscarora the news is about as heretofore reported. From the Bodies, news comes to hand that stringers are being cut, and everything points to good results at an early day in one, perhaps two, of the mines. Work is resumed on the 800 level in Bodie.

NEWSPAPER AGENTS WANTED.

Extra inducements will be offered for a few active canvassers who will give their whole attention (for a while at least) to soliciting subscriptions and advertisements for this journal. Apply soon, or address this office, giving address, age, experience and reference. Special inducements to old agents. DEWEY & Co., Publishers, No. 220 Market St., S. F.

DILUTED muriatic acid will take the mddy deposits out of gnage glasses.

MECHANICAL PROGRESS.

Chain Manufacture.

Chain manufacture, on the largest scale, constitutes at present a large portion of the business of the shops at the Charlestown (Massachusetts) Navy Yard. The process is an interesting one, and one that requires the greatest care, both in selecting the material and in the manner of working it up. The rolling mill and forge shops are being worked to their utmost capacity upon the construction of chain and anchors. The Government rejects all outside iron and is making its own, using nothing but the finest of malleable scraps.

Outside the shops lie tons of the old iron which is first sorted and then cut up into small pieces by immense shears, it is then piled upon a flat board in regulation sized heaps which are thrust into a furnace by means of an iron paddle resembling that used by a baker. From this it is withdrawn a glowing mass of white, hot iron, and then rolled into long flat slabs of about one-inch thickness. These are then cut up into short lengths, and of these short slabs piles of fine are made to be again subject to intense heat; these are withdrawn and rolled into billets of a few inches square at the ends and about two feet long; these billets are then thrust into a furnace for the third time, and at a white heat are withdrawn by means of large tongs suspended by a chain from an overhead trolley wheel. They are then rolled quickly into rods of various sizes and a number of feet long, and allowed to cool gradually in the air.

The rods are then cut cold into short lengths for the links, which are formed by again heating and placing upon a special contrivance and turned into a staple shape. The staples are then linked together, completing the chain, and the ends are welded together by hand. The joining piece is then put on, and the link is complete as far as workmanship is concerned. When a certain length of chain has been finished, it is put to a severe test. A long ditch running on one side of the shop is provided at one end with secure fastenings and at the other with a hydraulic engine, by means of which the chain is drawn tight and subjected to so many tons pressure. If it stands the test, all well and good; but if, on the contrary, a link breaks or contains any flaw, it is immediately taken off and a new one substituted, the old one to be again heated and forged. There are orders enough for chain ahead to keep this department in full operation for a year. Two great anchors of 2500 pounds each have just been completed, and a number more, some even larger than these, are in various stages of construction, and orders are coming in continually.

Iron Buildings.

Notwithstanding the great value of iron as a material of construction for certain purposes, we think that in this country, where more iron buildings, perhaps, have been erected than in all other countries put together, there is a strong feeling among architects that they have had their day; and that a better, safer and more durable structure can be made by combining masonry with iron than by using the metal as the only, or even the principal constructive material. In other countries, and especially in France, where iron construction is now applied to all sorts of new uses, it has the charm of novelty, and is often spoken of as the universal material of the future; but most experienced American architects have seen too many iron columns honeycombed with rust, and girders with half the thickness of the webs separating in flakes, to wish to entrust their reputation to such perishable material, while our fire engineers have thoroughly satisfied themselves that an iron building of the ordinary sort is less capable of resisting a severe fire than one of almost any other material. Among the engineers, a similar distrust of iron for construction exposed to the weather has become very general. Two serious accidents have shown that the life of a suspension bridge, with either wire or chain cables, is only about 40 years, and some recent examinations of plate-girder bridges have shown that, in about the same length of time, the web plates, notwithstanding careful and often-repeated painting, are eaten nearly or quite through, by corrosion, which works unobserved beneath the paint. The contrast between bridges which perish in a generation, and those which, like several of the masonry bridges built by the Romans, have been in use for nearly 2000 years, and are still in excellent condition, is too striking not to attract the attention of intelligent engineers, and the next decade is likely to see brick and stone extensively used for railway bridges, to the great advantage of the landscape in the neighborhood. Already, it is said that the officials of the Pennsylvania railroad, which has always led in scientific engineering, have given orders that no more iron bridges shall be built on the road, and the children of the present stockholders will probably have reason to rejoice at the decision.—*American Architect.*

RAPIDLY INCREASING DEMAND FOR IRON.—Iron is rapidly finding its way into new uses and thus, with the constantly increasing demand for its present and past uses, is testing to the utmost the productive capacity of the country in this direction. From its physical quali-

ties, iron is suitable for almost all constructive purposes. In addition to its use for machinery, electrical purposes, fencing and shipbuilding, it is now fast coming into large use for building purposes—dwellings and bridge building. In house building it is largely taking the place of machine woodwork. Wrought and sheet metal and galvanized iron is taking the place of wood for cornices, bay and other windows, stable fittings, vanite, shutters, all styles of heavy and light columns, girders, bolts, roofs, crests, fire escapes, ventilators, chimney caps, etc. In 1878 the demand for iron in the United States was 3,000,000 tons, in 1882, 4,000,000 tons, and this demand has increased until it has reached 8,000,000 tons, and it will therefore be seen that iron and its products have become one of our most important productions, necessitating the improved processes of manufacture which are so rapidly being introduced.

Heating Tire.

A very large majority of blacksmiths adhere to the old idea of heating tire up to a white heat by daylight, and then depending upon a deluge of water to prevent burning the felloe. This, in addition to the damage done to the wood by charring it, is a waste of time and money. The time necessary to heat to this extreme degree will be double what would be required to heat to a degree that would give a better result, without inflicting damage on the wood, and, in addition, consuming double the amount of fuel.

The law of expansion is well understood by engineers. In plain figures, the linear expansion of a bar of iron is about one forty-eighth part of an inch to the foot when the bar is heated up to 600°—a low heat that shows light red in the twilight, but which is imperceptible by full daylight. At this point, the linear expansion of a tire is at its greatest, as above it the transverse expansion or swell equals the increase in the linear expansion.

How low this heat is may be judged when iron at a welding heat is up to 1892°, and the common forge is capable of imparting heat up to 2346°. A tire 14 feet long will expand one-fourth of an inch when heated up to 600°, and about three-sixteenths when heated up to 212°, an expansion exceeding that required for any well-made wheel.

As charcoal ignites at 800°, it is evident that no damage can be done to wood by iron heated to 400° or less. If above 400°, it will char the wood unless cooled quickly by water; but the amount required is so small as not to damage the wood in any way.

If a tire comes loose upon a wheel in a short time after it is set, the wheel-maker is often accused of furnishing an inferior wheel; but if examined it will generally be found that the tire has charred the wood so that it crumbles from constant concussion, or that the felloes around the spoke ends are jammed in. This jamming of the fiber has weakened it, and the constant pounding of the wheel over the roads causes it to relax, and the tire is loosened because of the falling away of the felloe.

Had the tire been heated up to a point that would have set the wood snugly together in all its parts without "draw" enough to cause an extra strain, the solidity of the wood would not have been impaired, and there would have been no loosening of the tire in an unreasonable short time.

The old way of heating by stocking up the tires and building a fire around the pile is an operation that is too antique to be permitted in these days, even in a hack woods district. A man who sets a dozen tins in a year can afford to erect a tin-heating furnace, which can be done by using a few thousand bricks or a few cords of flat stone and a few hours' labor. Once erected it will last for years, and when needed, a few sets or a single tire are to be heated, it can be done in less time than it takes to build a fire around a tire on the ground. The fact that no carriage builder who values his reputation will heat his tire hot enough to burn the wood is of itself sufficient proof that a better result can be attained by a low than by a high degree of heat.—*Blacksmith and Wheelwright.*

STEEL FOR STAY BOLTS.—The announcement has recently been made that steel, as a material for boiler stay bolts, is not meeting with the qualified success that has allowed the introduction of the same metal for the plates of the boilers themselves, more than one large railroad company having abandoned its use after an impartial trial, and returned to some good brand of iron. It is assumed that as long as flat surfaces, stayed transversely by bolts, are employed in boiler work breakages will sometimes occur, the evil being inherent.

A NAPHTHA MOTOR.—A. J. Painter of Pasadena, Cal., has invented a naphtha motor in which the gas is exploded in cylinders by an electric spark from a battery. He thinks the motor can be used in street railway traction.

ARTIFICIAL GRINDSTONES, which outwear by years any natural stone known, are made of a mixture of pulverized quartz, powdered flint, powdered emery or corundum and rubber dissolved by a suitable solvent.

A GUN-HOOP, a hollow forging, weighing 34 tons, is the heaviest single article at the English Royal Naval exhibition.

SCIENTIFIC PROGRESS.

Mind and Matter.

Dr. J. S. Reed, of Trinity church, San Francisco, has recently commenced a series of discourses on "Christianity and Evolution," which are attracting considerable attention. The particular theme of the discourse two weeks since was

Mind and Matter.

Dr. Reed denies that the soul is the result of evolution; but he concedes evolution so far as physical life is concerned. He holds that the mental functions could not have been developed and perfected by the slow process of evolution. "Evolution," he said, "will not concede a special Providence for the creation of the soul, and yet all evolutionists are forced to the conclusion that mind and matter are not identical. In this we can easily detect an inconsistency, for if of different substances they must have had a separate and distinct source of origin. The soul is not the result of evolution from a first principle of physical life, but a creation of God."

In a communication to the *Morning Call* in reply to some comments on his discourse, he says: "What I tried to show was that the latest philosophy had ceased to believe in the supremacy of matter, and that the materialistic scare had had its day. I cited the recent utterances of Tyndall, Huxley, Spencer, to the effect that 'there is behind nature an infinite and eternal energy, from which all things proceed.'"

"I cited the experiments of Pasteur and Tyndall, which have forever discredited the doctrines of spontaneous generation, and endeavored to show that the whole scientific world is convinced that 'life is always the antecedent of life,' and he whom we call God was the originator of that primal cell from which, according to the theory of evolution, all subsequent life has been developed."

"I cited the position of Wallace and Schwann, that some of the great men of science at least still believed in the special creation of the soul."

"I cited the conviction of Tyndall, Darwin, Huxley and Spencer that the soul has been developed out of the original vital spark breathed by the Creator, in the beginning, with a piece of protoplasm."

"I further cited their confessions to the effect that mind and matter are not identical; quoted Spencer's argument to prove the existence of a soul independent of the body; and concluded by dwelling on the thought that, though the doctrine of evolution in its complete form involves the assumption of the growth of the soul along with nature and its gradual emergence into consciousness and thought, it was still possible to be scientific and a believer in the soul's immortality."

"I have not entered upon this course of sermons on 'Christianity and Evolution' without long and careful study, extending through a term of 15 years; nor have I the least intention of using the pulpit to confute scientific heresies. If I can show my congregations that the most modern school of thought has come round to the side of theism, and that even agnosticism has its affirmations, and so establish them in the faith, I shall do all I ever set out to do. I have no controversy with the science of the hour. Rather do I look upon her as the ally of religion; and in every case I desire to cite her 'latest word' on the articles that constitute our creed, assured that, in so doing, I shall be eliciting champions that will slay our doubts and foolish fears."

On the same Sunday, Dr. Robert Mackenzie of the First Presbyterian Church commenced a series of discourses upon substantially the same subject, taking the ground that

Evolution Is the Complement of the Biblical Creation.

He thought there was nothing incompatible with the Christian's theory of the creation and true evolution, one being a continuation of the other in a great measure.

"All truth is one," he said, "whether found in the Bible or in nature. In the one case we have the written page of truth, in the other its illustration. Science has not yet solved the problem of the universe nor is it attempting to do so. The mind of man is like a musical instrument—beyond the end of the scale there is an infinitude of space. Give me a nest of eggs and by means of evolution I will give you chickens in the spring. Evolution does not deal with the origin of life, but confines itself to its development."

"Resolve the world into a chaos of matter, whence came the matter? All things that are have come out of things that have been. All birds came from a nest of eggs, but whence the eggs? Let them come as you please, but whence the first? Evolution does not touch this point, and so cannot interfere with the doctrine of the creation as revealed to us by the Bible."

Electricity and Life.

Mr. Edward P. Jackson has a very suggestive article in the *North American Review*, on "Electricity and Life," from which we extract as follows:

It seems to be a pretty well established fact that electricity may be made at least a powerful stimulant to the growth of plants. May it not be more than a mere stimulant? May it

not be an actual creator of life? Beans, rye, corn, oats, barley, peas, potatoes, sunflowers, clover and flax have all been experimented upon, in some cases with astonishing results. In one series of experiments, the seeds were electrified before they were sown; in another, currents were maintained through the soil in which they were planted; and in still another, through the atmosphere immediately above the plants. In several instances, the yield of fruit was enormously above the average, and in all, the growth was unusually luxuriant. Further experiments are in progress, and it is not unlikely that science is about to add another to her long series of beneficent triumphs, another refutation to the roaking philosophy of Malthe and his disciples.

The results of the experiments have, furthermore, a suggestive bearing upon the relation between electricity and that inscrutable something which we call life. If they do not prove them the same, they at least bring them nearer together than any phenomena which have preceded them. When, in the healing art, enfeebled vitality is restored, either wholly or in part, by the skillful application of electricity, nothing is positively demonstrated beyond mere healthful stimulation, the mere awakening of life which already lay dormant in the system, such as might possibly have followed the use of other remedial agents. But here is not morbid restored to normal conditions, not dormant life reawakened to action. It is apparently the actual development of vitality not preexistent in the perfectly healthy and normal organisms under treatment. Electricity itself appears to be converted to vitality, as elsewhere it is converted to light, heat and mechanical motion.

Whether life can thus not only be renewed, but actually transference into the veins, or rather the nerves, of man, remains for physiological science to determine. It has already been shown that a living body is a species of thermoelectric battery, of which the ectoderm and endoderm are the opposite poles; that the exhilarating effects of a cold plunge, for example, are due simply to the increase of potential from the reduced temperature of the "cold" electrode. But merely setting a battery into operation, or merely increasing its action, is not increasing its inherent voltage, which is what the recent experiments seem to have done for plants.

But do not heat and the active principle of light artificially intensified produce similar effects? The forcing of vegetable growth in hothouses is an old process, not unlike the one in question, both in method and effect. According to the reports given, however, there is a very great difference in the results attained. If this be true, it would seem to indicate more strongly than ever that, of all forms of natural force, electricity bears the closest relation to that mysterious form of it which we call life.

EXCITATION OF MUSCLE BY LIGHT.—To the usual well-known ways of stimulating muscles to contraction, viz., electrical, thermal, mechanical and chemical, M. D'Arsonval has, says *Nature*, recently added that by means of light. He could not, indeed, get any contraction in a fresh frog muscle, when he suddenly threw bright light on it in a dark chamber; but having first in darkness stimulated a muscle with induction currents too weak to give a visible effect, and then suddenly illuminated the muscle with an arc light, the muscle showed slight tremulation. Not thinking this conclusive, however, M. D'Arsonval attached a muscle to the middle of a piece of skin stretched on a funnel, and connected the tube of the funnel by means of a piece of India-rubber tube with the ear. The muscle being now subjected to intense intermittent light, he heard a tone corresponding to the period of illumination, and this ceased when the muscle was killed with heat. Arc light was used, which was concentrated by a lens and passed through an alum solution to stop the heat rays.

STORMS PREDICTED BY TELEPHONES.—The telephone is about to have a new application, namely: That of forecasting storms. A new discovery has been made as to one of the properties of this means of transmitting sound. By placing two iron bars at seven or eight meters distance from each other and then putting them in communication on one side by a copper wire, covered with rubber, and on the other side with a telephone, a storm can, it is said, be predicted at least 12 hours ahead through a dead sound heard in the receiver. According as the storm advances, the sound resembles the heating of ballstones against the windows. Every flash of lightning, and, of course, every clap of thunder that accompanies the storm produces a shock similar to that of a stone cast between the diaphragm and the instrument.—*Cincinnati Commercial.*

TELEPHONIC CHURCH SERVICE. It is said, has proved so successful in Birmingham, England, that it is now proposed to develop the idea by connecting the hospitals with Christ Church, the center of the experiment. Already the wire has been switched on to the bedrooms of sick folk, and with marked success, a flexible cord being attached to the ordinary receiver, with a specially adapted instrument for fixing on the head of the invalid.

RAPID UNDERGROUND TRANSIT FOR BOSTON. Besen Hill, Boston, is about to be explored by diamond drills to ascertain the feasibility and cost of constructing underground railways for rapid transit through that city.

ELECTRICITY.

ELECTRIC LIGHTS FOR CARS.—An Englishman has devised a method of running a dynamo for the electric lighting of railway cars directly from the axle of the car which has heretofore been found to work very successfully, and where the dynamo was dependent upon the locomotive for its power many disadvantages were met with. The following description of the operation of this new method will be found interesting: When the train is at its maximum speed the extra current is fed into an accumulator, and when the speed slackens an extra excitation is given to the main dynamo by a smaller regulating dynamo and the secondary batteries. When the train stops the generating dynamo is automatically switched out of the circuit, and the current fed temporarily from the accumulators alone. By means of a complicated mechanism the electromotive force is kept constant all the time, so that there is no variation in the light, owing to different speeds of the train at different times.

A NEW MODE OF TELEGRAPHY.—It is said that Mr. Preece, the head electrician of the postal telegraph system in England, has succeeded in establishing communication across the Solent to the Isle of Wight, and telegraphed also across the River Severn without using wires, merely using earth plates at a sufficient distance apart. The matter of telegraphing across wide waters and also underground by short lengths of wires with long intervening spaces without wire has long been a matter of study with electricians of advanced thought, and we believe some promising experiments were made several years ago; but, until the above report met our eye, we had thought the matter had been laid to rest as an impossibility. Notwithstanding the extreme probability of reaching success in such a project, it is unsafe in this era of surprises to pronounce anything impossible. Possibly plates instead of wires may lead to the secret of success.

A NON-INDUCTIVE WIRE has been patented and has been put into practicable operation in Boston. The non-induction is accomplished by doing away with ground connections, the line doubling on itself and thus forming a perfect circuit. The outgoing wire is first perfectly insulated, and then wound spirally with a flat steel ribbon, through which the return current passes. The combination is then thoroughly insulated, and the two form a single line or cable from which or to which there is no induction. It is thought that the invention will greatly facilitate ocean telegraphy, as it will certainly avoid the great annoyance met with in city telephone lines, whose great numbers of wires are necessarily strung together on one line of poles, and by reason of which the induction is often so great as to render telephoning almost impossible. We shall allude to this matter more fully at an early day in the future.

ELECTRICAL CONVERSION OF PIG IRON.—Dr. Stephen H. Emmens is reported to have perfected a process for converting pig iron into wrought iron by means of electricity which appears to be a simple elaboration and adaptation of existing modes of electrical deposition. By his method Dr. Emmens claims to be able to produce ductile malleable iron of almost chemical purity from any quality of pig iron. The iron obtained, after washing, heating, and rolling, is said to be equal to the best Swedish brands. The inventor asserts that he can produce wrought iron by this means at a lower cost than by the ordinary puddling process, and that still further economy would result from the use of low grades of pig iron made from ores which are too impure to be treated by the existing mode of conversion.

AN ELECTRIC FLY-CATCHER.—The latest application of electricity is to the destruction of the dipterous pests which form an inseparable adjunct to the summer season. An ingenious inventor, with some knowledge of electricity, has recently constructed a unique electric fly-catcher, consisting of a small induction coil, giving about a quarter-inch spark, with a couple of battery cells, and a series of fine wires strung on a board, similar to a zither. Each alternate wire is connected to a terminal of the coil, and the sliding regulator is so adjusted that the spark will not strike across the metal threads until an unlucky fly alights on one wire, when the projecting body receives a spark and the victim falls between the wires, leaving the field clear for the next comer.

THE HOSKINS MOTOR.—The San Jose *Mercury* of Sept. 30th, says that T. D. Hoskins, the inventor of the motor which is to run on the railway to Alum Rock, states that the long looked-for machine will be in San Jose this week sometime, and that it will be put on the road immediately and kept on. Frank J. Sullivan, one of the projectors of the road, said that the late Mrs. Theresa Fair, who owned a large ranch adjoining the reservation, intended to interest herself in the road. She had an idea of taking up the lease of the reservation with a view of turning it into a fashionable resort, but the decision of the Common Council to prohibit the sale of liquor compelled her to abandon the notion.

THE APPLICATION OF ELECTRICITY IN THE PURIFICATION OF WATER.—Two new meth-

ods of softening water for industrial purposes have been recently proposed by M. Labrowski. One of these involves purely chemical reactions, and need not be noticed here; the other introduces an ingenious application of electricity. Hydrated oxide of lead is placed in a filter press which is traversed by the water to be purified, and this produces an effluent showing only one, or, at most, two degrees of hardness. In this way, all the carbonates, sulphates and chlorides are precipitated. Now, in order to work this process economically, it is necessary to produce the hydrated oxide of lead cheaply. A method has been devised by Villon for this purpose.

TELEPHONING THROUGH ONE'S BODY.—A telephone manager at Youngstown, Ohio, makes this statement: "Did you know that you can talk through a person's body? Well, I have joined the ends of a cut wire long enough for a person to ring up, and afterward held an end in each hand, but far apart, and the two persons could talk just as well through my body as if the lines were connected."

CHEAPENING TELEGRAPHY.—Various devices for increasing the speed and economy of telegraphing have been brought out recently, and it seems not unlikely that a new era of cheap telegraphy is at hand, when companies can send 100 words for 25 cents and make a handsome profit.

THE CALIFORNIA ELECTRICAL WORKS, that has the contract for the Santa Cruz, Garfield Park and the Capitola Electric Street Railroad, are progressing rapidly with the work of setting up the poles and track wires. The road will be ready to operate in November.

SLATE is extensively used for electric switch boards, and although it is liable to fracture, yet an electric construction company recently drilled 12,000 quarter-inch holes in a slab five-eighths of an inch thick and containing but 22 square feet of surface.

AN ELEVATED ELECTRIC ROAD FOR BERLIN.—Berlin is to have the benefit of an elevated railroad, built on the model of those in operation in New York, but Berliners will have the advantage in that the motor power employed here will be electricity.

AN IMMENSE ELECTRIC LAMP.—At the naval exposition in London there is a colossal electric lamp constructed by the admiralty. It gives a light equal to that of 5,000,000 candles, and is placed in a model light-house 56 meters above the ground.

AN INVALID CHAIR, propelled by electricity derived from a storage battery placed underneath the seat, is a late invention. It works to a charm, and one charge of the battery will run the chair for 50 or 60 miles.

The San Jose Electric Road.

The Committee of the Supervisors of San Jose, to which was referred the matter of preparing a draft of a franchise for an electric road, petitioned for by Felix Chappelt and others, from San Jose to the Alameda county line, have reported, and the matter was set for hearing on Tuesday, Oct. 20.

The franchise as reported provides that the gauge shall not exceed 3½ feet; that T steel rails, 35 pounds to the yard, shall be used; that the road may be used for both the transportation of passengers and freight; that freight trains shall run between the hours of 9 P. M. and 5 A. M.; that passenger trains shall run at intervals of not less than an hour between the hours of 7 A. M. and 9 P. M.

The franchise is to continue for 50 years; that the entire road must be completed in two years. The grade must conform to the grade of the traveled roads over which it may pass. The road must be operated at the start by the most improved electric motors, worked by stationary engines; that the overhead system shall be used but that whenever a more improved system of electricity for such road is perfected, the Supervisors may authorize the use of the same at the company's expense.

A speed of 25 miles an hour may be employed on all portions of the road, except in passing through Milpitas, where only 12 miles per hour is to be permitted.

The proposed new road will connect all the towns between Oakland and San Jose that are now isolated from railroads. It is proposed to run cars at least every half hour. It is proposed to make the fare from 25 to 30 per cent cheaper than the present railroad fare. The road, including the two branches, one via Alvarado and one via Warm Springs, will be about 43 miles in length, and will cost from \$450,000 to \$500,000. It is proposed to arrange matters so that the road between Oakland and Hayward can be operated in conjunction with the San Jose road.

Mr. Chappelt states that work will be commenced within 30 days. He estimates that the construction of the road will cost \$6000 a mile.

It is announced that a New York and Boston syndicate has purchased all of the street railways of Detroit for the consideration of something over \$5,000,000. The motive power on all the lines will be changed to electricity. This will throw about 2,300 horses on the market.

It is said that North Carolina is to have one

of the longest electric railways in the world. It is to run from Asheville to Rutherfordton, a distance of 41 miles. The power to operate the road is to be derived from water. The line is intended for both freight and passenger service.

A syndicate has been formed at Cambridge, Mass., to build an electric road between Marlborough and Westborough, Mass. It is the intention to put such a road into active operation at once if the charter can be obtained.

USEFUL INFORMATION.

REPAIRING TERRA COTTA.—On the handling and rehandling of terra cotta of all kinds, it is liable to be chipped or broken, especially on the corners, where it is to be joined to some other piece of architectural design. When this happens, it is best to examine the broken part, and if it has a slant outward or inward, take a sharp chisel and light hammer and make saw-tooth indentures in the sharp part of the break, and then, when it is in position, point up the place with a cement composed as follows: Mix 20 parts clean river sand, two litharge and one of quick-lime into a thin putty with linseed oil; if for red terra cotta, color to the desired shade with venetian red; if buff, with yellow ochre; if brown, with Spanish brown. The cement should be made all at one time, and the pointing up should also be done as to avoid a variety of shades. When this kind of cement is applied to mend broken pieces of terra cotta or to mend broken pieces of stone, as platforms or exterior or interior steps, it acquires after some time a stony hardness.—*The Brickmaker.*

A USELESS KIND OF A FIFTH WHEEL.—A "fifth wheel" is a common expression for uselessness, but "that fifth wheel carried with all army wagons makes me awful tired," said an old man, with a semi-military bearing, as he recently pointed his cane at a picture of an army wagon. During the war I drove a wagon from Paducah to Shiloh, and from there to Atlanta, and then to the sea with Sherman. I hauled one of them fifth wheels all of the way and never found use for it; in fact, I never, in all the four years I was on that trip, heard of a fifth wheel being needed. Some other part of the wagon was sure to break, but a wheel—never. But the Government began to haul a fifth wheel during the Revolutionary War, and is still at it, if that picture correctly represents the army wagon now in use. The practice was introduced by Washington, who lost one of his wagons during the Revolutionary War by the breaking of a wheel. Nobody has since countermanded the order he then issued, although the army has never since lost a wagon in this manner.—*Exchange.*

PREPARED PAPER is still fighting its way and making most remarkable progress in substituting itself for other material in various branches of industry. It is now taking the place of wood in the manufacture of packing cases, and so perfect is the manufacturing process that in many instances nothing but the wonderful differences in weight can afford a clue to the presence of paper in the manufacture. Paper packing cases are indistinguishable, apparently, and the saving they effect in freight is enormous. Thousands of dollars are already invested in this comparatively new industry, and a new company, with \$1,250,000 capital, has been organized to introduce paper boards into other lines. Experiments have been made with huggy wagons and other things where lightness is needed, and paper floorings in lieu of boards will soon be heard of. It is easy to render the material fire-proof in course of its construction, and this is an additional advantage that is highly appreciated.

WOOD WITH A MIRROR POLISH is coming into use for ornamental purposes in Germany in place of metal. The wood is first submitted to a bath of caustic alkali for two or three days at a temperature of about 175° Fahr., then dipped into hydrosulphate of calcium for 24 to 39 hours, after which a concentrated solution of sulphur is added. After another dip in an acetate of lead solution at about 100°, a shining metallic surface is given by polishing when dry with lead, tin or zinc.

SEWING BRASS.—A sewing machine was recently exhibited in Boston, which, it is said, stitched rapidly and easily through leather one-half of an inch thick. Stitches were made evenly and rapidly through a piece of bird's-eye maple three-eighths of an inch thick. As a final test, the machine sewed through a layer of brass one-eighth of an inch thick placed between thin pieces of leather.

PAPER PULP BOBBINS, spool heads, etc., are now made of wood pulp. The advantages of this substance for such purposes are marked, since a bobbin thus made will not split or wear rough, and the yarn will not be likely to be caught and broken. If these bobbins can be manufactured at a reasonable price, it is said that they will practically supersede the old style bobbin.

RAPID LOADING.—The tank steamer Beacon Light, running in the trade of the independent refiners, between New York and European ports, was recently loaded at New York with 1,260,000 gallons of refined oil in 10 hours,

making thereby the quickest time in which a cargo of refined oil has ever been loaded.

TACKS taken from carpets should be well scolded before being used again, as a precaution against the moth.

GOOD MEALTH.

The Apple for Food and Health.

The apple in ancient times was believed to possess great restorative qualities. Chemistry tells us in modern times that this fruit is composed of vegetable fiber, albumen, sugar, gum, chlorophyll, malic acid, lime and much water, says *Field and Farm*. The German analysts declare that the apple contains a larger percentage of phosphorus than any other fruit or vegetable. This phosphorus is admirably adapted for renewing the essential nervous matter, letholone of the brain and spinal cord. Old Scandinavian legends or traditions represent the apple as the food of the gods, who, when they found themselves growing feeble and infirm, resorted to this fruit to renew the powers of the mind and body.

Judging from these traditions, apples must have been highly thought of in ancient times and their restorative qualities understood. The acids of the apple are of great use to people of sedentary habits, whose livers are sluggish of action. They eliminate from the body noxious matters, which, if retarded, would make the brain heavy and dull, or bring out jaundice or skin eruptions, and other allied troubles. Some such experience must have led to the custom of taking apple sauce with roast pork, rich goose and like dishes. The malic acid in ripe apples, either raw or cooked, will neutralize any excess of chalky matter generated by eating too much meat.

It is also a fact that such fresh fruits as the apple, the pear and the plum, taken when ripe without sugar, diminish the acidity of the stomach rather than provoke it. The vegetable salts and juices are converted into alkaline carbonates, which tend to correct acidity. A good, ripe, raw apple is one of the easiest of vegetable substances for the stomach to deal with, the whole process of digestion being complete in 85 minutes. A poultice of rotten apples is said to be an excellent remedy for weak rheumatic eyes. In the French hospitals an apple poultice is applied to lamed eyes, the apple being roasted and the pulp applied directly to the eyes; that is, without the intervention of any cloth or substance. A modern maxim teaches us that "to eat an apple going to bed, the doctor then will hug his head."

A SEA TRIP FOR HEALTH.—When exhaustion has gone so far as to produce a condition of positive breakdown without any special organic lesion a sea trip is in most cases to be preferred to any alternative. The patient has the advantage of perpetual carriage, exercise without the irksomeness of restrained posture and without its limitation to a few hours of sunshine. The chilling effects of night air and alternations of dryness and dampness of atmosphere are almost unknown to sea, and a recovery may in such cases usually be predicated as following almost certainly a few weeks on shipboard. But it is to the middle-aged man more than all others that a holiday at sea is recommended. In the great majority of cases a man who leads an active business or professional life selects his form of holiday as much for what he gets away from as for what he gets to. The desire to get out of harness and to escape from the weary treadmill of the recurring cares, from which few active men are free, is never better met than by a voyage. To such men exercise is a secondary consideration. Fresh air and the incidents that vary the monotony of sea life are sufficient to give all the benefits that any change can give, while the gentle exercise of walking the deck is sufficient to stimulate the appetite and promote digestion. The impossibility of doing anything more energetic than walking the deck is a safeguard to persons of this class; for, after the first flush of youth is over, the sudden transition from a sedentary life to severe exertion is more apt to be attended with risk than with benefit.—*London Medical Recorder.*

A NEW DISINFECTANT.—A recent discovery, which is the outcome of the investigations of Dr. H. Oppermann, and which he has also patented, is the application of dolomite to antiseptics. The dolomite, after a special preparation, is mixed with a certain proportion of oxide of iron and iron pyrites, and the mixture is employed in the form of a powder. According to the experiments made at the Hygienic Institute, at Kiel, it seems likely to substantiate its reported efficacy.

DEATH FROM A STING.—A honey bee's sting has caused the death of a Williamsport (Pa.) man within 15 minutes after its infliction. The physicians who were called were mystified, but expressed the belief that the bee's sting had entered a nerve or blood vessel, and that the poison was quickly carried to the vital organs, causing almost instant paralysis.

A CURIOUS CASE.—Cincinnati physicians are puzzled over the case of a man who, acting as a peace-maker in an affray, was struck on the breast bone and has been dumb ever since. The injuries to his breast have healed, but he is unable to articulate a word.

Passing Events.

It is now pretty well understood that the committee of the Sacramento Supervisors, who visited the hydraulic mines at Iowa Hill, will recommend, and the Supervisors will approve, that the miners be given until the 1st of next June to "clean up." If this is the case, the miners will do as much work as possible this winter.

The coal ships loading at and on the way from Australian ports for this city and San Diego have a registered tonnage of 107,279 tons. Of this, 91,282 tons are for this port. This is the largest coal tonnage ever headed at one time for the California ports.

The shipment of bar silver from Napa Co., noted in our "Mining Summary," is a matter of general interest. It upsets the theory of many mining men that no silver mine of value would be found in the Coast Range. This Napa mine is doing well and sending the pure silver to the Mint in this city, which is the best evidence that there is a producing silver mine close to the coast line.

The success of the Germans in bringing an electrical current to Frankfurt, over 100 miles, with only 25 per cent loss, is suggestive of future benefit to this State when there is abundant water-power. For the mining interests it would be of immense advantage to convey the power for a long distance from stream to mine.

Sampling of Auriferous Concentrates.

The most abundant of all the ores of copper, and the principal product of the Cornish mines in England, is copper pyrites, or yellow copper ore. This ore, when dressed, and in large quantities, generally has a considerable proportion of slimes mixed with it; but even without the slimes, it is exceedingly difficult to obtain by the usual mode of sampling a fair average of it, even when done by those who have had long and practical experience in sampling ore. The difficulty is, however, trifling when compared with that required in the sampling of auriferous concentrates, commonly termed sulphurets, such as we have in California.

Some of the auriferous concentrates have small quantities of telluric gold in them; but as that ore when stamped fine is easily carried away by even a slow current of water, the proportion in the concentrates is generally very limited.

A good "test for tellurium" is as follows: Place in a test tube, or other vessel capable of resisting the action of acids, a small amount of the suspected material, which has been separated as thoroughly as possible from the accompanying gangue. Add enough pure sulphuric acid to well cover the sample and heat to boiling. If tellurium is present, the liquid becomes colored a clear purplish-red.

The gold in the iron pyrites (sulphurets), and also in the arsenical pyrites, exists in a metallic state, the latter having the gold in a coarser condition and in larger quantities.

A microscopic examination of the pyritic matter shows the different forms in which the gold occurs, which is invisible to the naked eye. By the aid of the microscope some of the faces of the crystals of the iron pyrites will be found to be covered or distinctly gilded, and upon dissecting the same crystals the cleavage will also show some gold in one form or another. In the collection made by Melville Atwood Esq., of this city, may be seen some of these gilded crystals and the different forms alluded to.

Now, from the fact that the presence of some of the gold in the pyrites can only be determined by the aid of a microscope, and that only as a fine gilding, some notion may be formed of the excessive fine state of its divisions and how unsatisfactory would be the task of trying to separate such liberated films from water in motion. Some of the finest grains of gold will float in slightly agitated water.

The decomposition of pyritic matter by nitric acid, or the deflagration of it with nitrate of soda is frequently resorted to as a test to show the larger-sized particles of gold and the different forms in which they exist in the pyritic gangue.

The concentrates from the different mills is generally stamped fine enough to pass through a sieve having 25 holes to the linear inch, of which from 40 to 50 per cent will pass through a sieve of 80 holes to the linear inch. The later portions are very rich, the veinstone having been reduced sufficiently fine to rid the gold of the pyritic gangue, which has been washed away.

When the concentrates are from a mill where amalgamation in the battery is the system in use, the frothy amalgam that has not been lost or carried away with the water will be found mixed with the concentrates. Nearly all the gold is in a metallic condition, and in various shapes and sizes, with some amalgam mixed with it and distributed so unevenly in the large piles of concentrates of which it only forms such a very limited part, renders it nearly impossible with the greatest care to obtain anything like a fair sample, so that the reports of the working of the concentrates up to 94 per cent of the gold contents must be taken for what it is worth.

A great deal has been written respecting the Comstock ore, but so far we have not seen any thing published describing the character of the gangue, condition and form of the gold in the Comstock lode, information so necessary and important to those milling the ores. The loss must be something very great, if even a large proportion of the gold is in a pyritic gangue, like that in most of our California gold mines.

CAPT. THOS. E. FRASER who was in charge of the construction of the Lick Observatory, died at Banning, San Bernardino county this week.

Electrical Transmission of Power.

Electrical transmission of power is just now one of the most interesting and important subjects which can engage the attention of engineers. It is very generally recognized as one pregnant with great possibilities. Until quite recently electricity could only be used as a secondary power for steam, at great loss, it at best could only be derived from water power at short distances. But recent experiments in the transmission of the electric current have resulted in most unexpected success. Streams that have hitherto had no pecuniary value are now being employed for producing electricity at great distances from the point of utilization. Notable instances of such enterprises are constantly coming to us from every direction. Long distance installations have become most eminently practicable and economical.

Very important and interesting experiments in this direction have been made in both Germany and France. The most notable of these is the transference in Germany of 300-horse power a distance of 108 miles from the Cement Works of Lauffen to light the electrical exhibition now in progress at Frankfurt. This transmission has been effected by means of high tension alternating currents of the new rotary system. The current is generated at Lauffen in a Brown dynamo, with low tension, then transformed in oil transformers to high tension and conveyed to Frankfurt by three overhead one-eighth inch copper wires, with triple oil insulators. Here it is again transformed to low tension in oil transformers, and the energy used for incandescent lamps and motors. The voltage in the conductors has reached 16,000, and the transferred energy already amounts to 80-horse power and feeds 800 incandescent lamps and a motor which is to drive the pump of an artificial waterfall. The enterprise, which costs \$200,000 works well, and the experiment is proving a great success and of eminent importance to the scientific progress of mankind.

There are several other similar enterprises of importance in Europe to which reference might be made. The success which has attended the long-distance installations in Europe in attracting much attention among electricians in the United States and among other proposed projects is one for transmitting power from Niagara Falls to Chicago during the Columbian exhibition, and making its utilization there one of the chief features of the exhibition. Why not? We do not lack either theory, practical experience or money for such a work. Let our engineers prove that the new world can outdo the old in this latest and grandest of modern inventive progress.

California seems determined to keep fully abreast of the foremost in this work. The immense water power at Folsom, as already noticed in these columns, will probably be the first large movement in this direction. Electricity will be furnished for lights and power to the city of Sacramento, 18 miles distant.

The enterprising people of Fresno are already talking of bringing 100,000-horse power from Millerton to that town by wire, to run machinery, mills, street cars, elevators, etc. There is an abundant supply of water in the foothills that might be thus utilized to furnish most of the power needed all through the San Joaquin valley, from Stockton to Tehachapi. California in the early future, will come well to the front in thus utilizing her water power, which exceeds in volume and convenience any other State in the Union.

Phoenix Converter Plant.

In his description of the progress of production of ingot iron in the converter in Germany, Dr. Wedding, in his paper before the American Institute of Mining Engineers, says: "After de-oxidation and recarbonization in the converter, the iron is lapped into a ladle, which in basic works is attached, as a rule, to a crane carried on a locomotive. The fluid metal is conveyed to another room where it is poured into ingot molds. In some cases these arrangements are impracticable, perhaps because old acid plants have been adapted for the basic process. The latter is the case with the handsome works near Phoenixhutte, near Ruhrort, Rhenish Prussia. There it is necessary to pass the ladle from one crane to another, as shown in the cuts. The crane here serves to bring the liquid pig from

the blast furnace and to receive the ladle containing ingot iron from the converter. The latter ladle is delivered to a second crane, which stands in the center of the casting room.

Washington Iron.

Some considerable interest is being manifested in the iron deposits of this coast at this time. A company has been incorporated at Seattle which proposes to make iron and steel. It has bought 106 acres of land six miles north of the city, within reach of the railroads, the lakes and the Sound. Chief promoter of the enterprise is Col. Ogden Street, for a number of years connected with the Carnegie Iron Works of Pittsburgh and with the furnace-building works of J. P. Witherow of the same city. He also constructed the furnace for the Schofield Furnace Company of Sheffield, Ala.

This gentleman has been in Washington for some months, and says the iron ores of Washington compare favorably with those of Lake Superior. "They are equally as good, the difference being that they are somewhat harder and will require slightly more fuel in working. But when you come to compare the iron ores of the South and Pennsylvania with those of Washington, to use a common expression, 'they are not in it.' In reality, there is no comparison. The coke of Washington is also equal to the celebrated coke of Connellsville. The fact has been demonstrated to my entire satisfaction by Pittsburgh chemists of known reputation. They have made the tests, and they are thorough."

"There is an abundance of ore for the production of the highest quality of steel irons and admixtures descending to the commonest irons of the South. It is the purpose of the company to first erect a blast furnace for the production of pig iron as the basis of other manufacturing enterprises, among which are a pipe foundry for making cast-iron pipe, Bessemer, open hearth and direct steel plants, with accompanying mills for turning out finished products."

"The blast furnace will have a capacity of daily product of 200 tons, or 60,000 tons per year. This means the handling of 750 tons of material daily, in ore, coke and limestone."

A "Poisonous" Spring.

Mr. John T. Evans, the assayer and chemist of this city, who has just returned from a professional visit to Siskiyou county, tells us of a curious "poisonous spring" on Mount Shasta, within about a mile of the snow-belt. It is known as the poisonous spring, because birds, snakes, mice, chipmunks, etc., are killed in numbers when they approach the spot. Yet the water itself is of marvelous purity. An analysis by Mr. Evans shows only $4\frac{1}{2}$ grains of solid matter to the U. S. gallon. The Spring Valley water of this city, which is good and clean contains about 24 grains. A great quantity of carbonic acid gas is given off by the spring and in an area of 15 feet around it. This gas remains close to the ground. A lighted match will burn until within two inches of the surface of the spring on the ground, when it is immediately extinguished. A man or dog is not affected, but small animals or birds, hutterflies, snakes, etc., are suffocated when coming within the area described.

The spring wells up in a little hollow and the gas collects there on a still day. If it were in a cave, it would be just like the famous Grotto del Cane, or cave of the dogs near Naples in Italy, where a man can go in unharmed but a dog, being lower down, is suffocated.

The water in the spring is exceedingly clear, evidently coming from a source in the snows of Mt. Shasta. This water, coming down in some underground channel, must meet a body of carbonic acid gas on its way from the old crater. As the water rises to the surface, there being not enough solid matter to make bicarbonates, the gas is immediately set free. The water itself is pure, and pleasant to the taste.

There is said to be another spring of this kind in Mendocino county. Such springs are, however, rare.

THE Market Street Cable Railway Co., has sued the National Indicator Co. and H. Berryman, its president, for \$919 alleged to be due as rent of the cars for four months, and for the expense incurred in removing the indicators.

SHEET IRON PIPE

IRON PIPE

ALL SIZES, FOR GAS, STEAM AND WATER.

— WE MANUFACTURE —

SHEET IRON AND STEEL PIPE,

ALL SIZES,

For Water Supply, Mining, Irrigating Purposes, Stock Ranches, Etc.

Made in Lengths Desired from 16 to 30 feet.

The Cut shows a Section of Three Joints

DOUBLE RIVETED SHEET IRON PIPE.

In the manufacture of this Pipe, we use only a high grade of annealed Charcoal Iron of great tensile strength. The weight or thickness of metal used, is graded according to service required, and pressure to which the Pipe will be subjected.

FOR ALL UNDERGROUND PURPOSES, we immerse the Pipe in a bath containing a special mixture of ASPHALTUM, BITUM and PETROLEUM, at a Temperature of 300° Fahrenheit. It thus receives a thorough coating, both inside and outside, rendering it impervious to the alkalies of the earth, rust, etc., and is practically indestructible.

NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity

2. The freight to mine is less than one-half of stamps.

3. The cost of erecting is less than one-fourth of stamps.

4. The power to drive it is less than one-half of stamps

5. The wear is less than one-quarter of stamps.

6. There is no wear except on shoes and dies.

7. In point of amalgamation it is superior to any other machine in use.

8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

Send for Circulars and Price List.

MARSHUTZ & CANTRELL.

THE BLASDEL

CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Concentrating Belt manufactured in San Francisco; we can therefore fill all orders on short notice. The length and width of these belts are the same as is used on the Frue or Triumph Concentrating Machines, but can be made of any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffls also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

ROPER'S
Practical Handy Books for Engineers & Firemen
By STEPHEN ROPER, Engineer.

The Engineer's Handy Book, containing a full explanation of the Steam Engine Indicator, and its use and advantages to engineers and steam users, with formulae for estimating the power of all classes of Steam Engines. Price, \$3.50.

The Young Engineer's Own Book. Containing an Explanation of the Principles and Theories on which the Steam Engine as a Prime Mover is based. Price, \$3.00.

Questions and Answers for Engineers. This little book contains all the questions that Engineers will be asked when undergoing an examination. Price, \$3.00.

Handbook of Modern Steam Fire Engines. The only book of the kind ever published. Price, \$3.50.

Catechism on High Pressure, or Non-Condensing Steam Engines. Price, \$2.00.

Care and Management of the Steam Boiler. Price, \$2.00.

Handbook of Land and Marine Engines. Price, \$3.50.

Handbook of the Locomotive. Price, \$2.50.

Use and Abuse of the Steam Boiler. Price, \$2.00.

Instructions and Suggestions for Engineers and Firemen. Price, \$2.00.

These books embrace all branches of Steam Engineering—Stationary, Locomotive, Fire and Marine. Any Engineer who wishes to be well informed in all the duties of his calling should provide himself with a full set.

KROGH'S MINING HORSE-POWER HOIST

Is known to be the
Best Horse-Power
Hoist now made.
It is strong and
durable.

The drum will
carry 1000 feet of
No. 8 wire steel
rope. It can be
used to run a
pump or blower,
in conjunction
with hoisting.
Manufactured by

**F. W. Krogh
& Co.,
51 BEALE ST.,
San Francisco.**

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case. Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Oct. 8, 1891.

General trade continues active, with all branches participating. How a very prosperous season can be averted it is hard to see, for with unusually large crops in all farm products, and prices, outside of fruit, considerably higher than for several years, money will be in large supply and seeking investment. The ships now on the way have a carrying capacity sufficient to market the remainder of the surplus wheat. The surplus this season represents a cash valuation of fully \$35,000,000. This is a larger sum than the surplus of any one season has been marketed at for several years.

MEXICAN DOLLARS—The market is without essential change. It is quoted at around 77 cents.

QUICKSILVER—Receipts the past week aggregate 270 flasks, and the exports by sea 130 flasks to Mexican ports. For the first nine months of the current year the receipts at this port aggregate 10,513 flasks—an increase of 1245 flasks over 1890—and to exports for the like time 3962 flasks—a decrease of 348 flasks. The market is fairly firm at \$40.50@41.

SILVER—The markets abroad and at the East have fluctuated to lower prices. The decline in the face of all outward conditions being favorable to better prices causes considerable speculation as to the influences at work to bring it about. So far as the writer has been able to learn, no one is able to give an intelligent reason for the weakness. With a good-sized wheat crop in India, and the price much higher, considerably more silver is being sent there in payment for the cereal, yet this and the purchases by the United States have seemingly no favorable effect on the market. The writer holds to the opinion previously expressed that the silver market is being manipulated for speculative purposes. This is the more easily done, owing to the position of the two principal parties at the East on the free coinage of silver.

BORAX—Receipts the past week aggregate 320 cts. The receipts for the first nine months of the current year aggregate 593,300 lbs., against 812,000 lbs. in the like time in 1890. The exports for the first eight months of this year aggregate 82,544 cts., against 70,855 cts. in the like time in 1890.

LIME—Receipts the past week aggregate 3687 bbls. The market is steady, with a fair demand ruling.

TIN—Receipts the past week aggregate 500 boxes plate by rail. The market for both pig and plate is easy. The demand is entirely nominal and to effect sales, concessions are necessary. Both here and at the East the market appears to be of a "waiting" character. Plate on spot in New York can be bought cheaper than "for shipment." English cablegrams report firm holding by makers.

LEAD—The market is reported firm. The consumption has been quite large—larger than in either 1890 or 1889. At the East the market is reported strong at \$4.55, with holders firm in their views.

COPPER—The bark J. D. Peters, hence for New York, took out 391,630 lbs copper matte. The market is strong. The New York market is reported by the *Iron Age*, as follows: In the past week there have been transactions involving upward of 500,000 lbs. Lake Superior product for delivery during the balance of the year at 12½¢, making a total of not less than 15,000,000 lbs sold here during the past fortnight at 12½¢@12½¢. Of that quantity a considerable portion was for electrical purposes, but the purchases by manufacturers of copper and brass goods were of good amount. At present there is a fair demand from the latter interest, but inquiries for cables and bars figure more conspicuously and indicate that the consumption of the metal for electrical purposes is gaining headway. Ingot may be secured at 12½¢ cents, or a shade less, for prompt or near future delivery, in limited quantities, but Cakes and Bars at less than 12½¢ cents for forward shipment are not obtained. Arizona Ingot appears to be rather scarce, with 12 cents a strictly inside price and 12½¢ cents generally asked. For casting brands there is nothing more than a routine demand at present, but the offering is reserved and prices are held at 11½¢@11½¢ cents.

IRON—The market continues easy with large buyers able to get concessions. The quantity being used by iron workers is steadily increasing. The East reports increasing activity and strengthening markets.

COAL—Receipts the past week aggregate as follows: From Departure Bay, 3,995 tons; Carmelo Bay, 250; Seattle, 1840; Baltimore, 3006; Tacoma, 4000. Total, 12,992 tons. The ships on the way from Australian ports to San Francisco have a registered tonnage of 91,282 tons, and on the way to San Diego, 15,997 tons. Total, 107,279 tons, equivalent to a carrying capacity of about 171,600 tons of coal. The coal tonnage on the way from Atlantic and English ports is quite large. The above, in conjunction with the large output of the coast mines, indicate that we will have an abundance of cheap coal this winter, notwithstanding the increased requirements in this State.

Eastern Metal Markets.

By Telegraph.

NEW YORK, October 8.—The following are the closing prices the past week:

	Silver in Silver in	Copper.	Lead.	Tin.
Thursday	46	97½	12 35	4 50
Friday	46	97½	12 35	4 55
Saturday	46	97½	12 30	4 55
Sunday	44 13-16	97	12 30	4 55
Tuesday	44 13-16	96½	12 30	4 55
Wednesday	44 13-16	96½	12 30	4 55

Quicksilver is strong and fairly active at 60c. Copper going into consumption at strong prices. Lead is firm under good demand. Borax is steady at full prices. Tin is barely steady.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

Assessment Notices.

CALIFORNIA AND ARIZONA MINING COMPANY.

Location of principal place of business, 330 Pine Street, San Francisco, California. Location of works, Mohave County, Territory of Arizona.

Notice is hereby given that at a meeting of the Board of Directors held on the 29th day of September, 1891, an assessment (No. 4) of Ten Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in U. S. gold coin to the Secretary, at the office of the Company, 330 Pine Street, San Francisco, California.

Any stock on which this assessment shall remain unpaid on the 9th day of November, 1891, will be delinquent and will be advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 30th day of November, 1891, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
T. E. JEWELL, Secretary.
Office, 330 Pine Street, San Francisco, California.

NEW EL DORADO GOLD MINING COMPANY.

Location of principal place of business, San Francisco, California. Location of works, Greenwood, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 21st day of October, 1891, an assessment (No. 5) of Five Cents per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, No. 310 Pine Street, Rooms 15 and 17, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of November, 1891, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on FRIDAY, the 27th day of November, 1891, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
J. W. PEW, Secretary.
Office, No. 310 Pine Street, Rooms 15 and 17, San Francisco, California.

DELINQUENT SALE NOTICE.

GRAY EAGLE MINING COMPANY—Location of principal place of business, San Francisco, California. Location of works, Placer county, California.

MINE HOISTING ENGINE

With or Without Automatic Brake, as desired.

These Engines having large drums, are particularly adapted for mines, inclines, or other rapid hoisting. The drums are either plain, lagged, or grooved as desired, and lagging or grooving is done for $\frac{3}{4}$, $\frac{1}{2}$, or 1 inch wire rope, as ordered. The engines being reversible, two loads or hoists may be operated at the same time, one going down and the other coming up. They are very simple and strong in design and construction, rapid in motion, easily handled and occupy but comparatively little floor space, while the best results are produced in their efficient working. Each engine is fully equipped with fittings, and supplied with automatic brake, when so specified in order. These engines are made with either friction or reversible link motion, or both as desired. These Engines are built in sections suitable for lowering down incline or shaft for underground uses.

and Occupying Less than One-half the
Space of any other Concentrator.

Built of Best Steel and Wrought Iron.
STRONG AND DURABLE.

Price.....\$575 f. o. b.
Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. This excess in the girth of material effectually prevents the edges from cracking. Plain edge belts have to stretch about one inch to the foot as they pass around the drums. This continuous stretch cracks the edges. The improved belt obviates that difficulty.

FRUE ORE CONCENTRATOR

OVER 3000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and such success have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or testimonials, call on or address us at our office.

Manufactured under Patents of April 27, 1880;
September 18, 1883; July 24, 1888;
and March 31, 1891.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD, OVER 1300 IN USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

A Centrifugal Gold Extracting Process.

A plant designed for dealing with gold ores has been devised by Rowland Jordan, and made by T. B. Jordan & Son, 15 George St., Mansion House, London. As described in "Lock's Ore Dressing Machinery" it consists of two portions—the reducer and amalgamator. The reducer is shown in Fig. 1 of the accompanying cuts, and the amalgamator in Figs. 2 and 3. The author's report says:

The plant employed is remarkable for its simplicity, and but little description is necessary. The menal stone-breaker begins the process. This is followed by a revolving pan, set at an angle, and carrying three massive balls of white iron, which work in a suitably shaped bed, also of white iron, round the greatest circumference of the pan. The ore and water are fed automatically into the bed of the pan, and by the rotary motion of the latter, are conveyed under the rapidly revolving balls, whereby the comminution of the ore is effected. The inner half of the floor of the pan rises as a shallow dome surrounding the central shafts, and is fitted with movable frames carrying wire screens of any required mesh. The feeds of ore and water and the inclination of the screens are so adjusted that, as the ore is reduced to a sufficient degree of fineness, it is washed over the screens and passed away into a launder for conveyance to the amalgamator.

The inventor says that generally it may be stated that the total cost of the patent plant erected at the mines will not exceed one-half that of a stamp battery.

The patent pan has a continuous action on an evenly distributed and constantly changing layer of ore, and thus accomplishes a great amount of work.

Trials with various ores showed a power of reducing 20 to 25 tons per 24 hours to a size that would pass an 80-mesh screen, which is faster than battery work, where the outlet for the pulp is limited. With a patent pan this

FIG. 1.—JORDAN'S REDUCER.

drawback is obviated. The screen area is much greater in proportion, and the screens set at a very low angle (almost horizontal). These features, combined with the wash produced by the rotation of the mill and inclination of the jet of feed water, increase the facilities of outlet in a most remarkable degree.

Another advantage which, in most cases, would be of primary importance is that the consumption of water is only about half the amount required by a battery. In a crushing of "Edwin Bray" ore, the water feed was only a 1-inch pipe, and the ore, fed from a stone-breaker, was passed through an 80-mesh screen at surprising rate, not less than 20 tons per 24 hours. Such a result speaks for itself. Moreover the power used to effect this is about half

that needed with stamps, while the labor is virtually nil. With automatic feeds one man could watch a dozen pans, and the prodigal use of mercury, so common with stamp batteries, is dispensed with.

In wear and repairs the patent pan has advantages over the battery. There are only two wearing parts in the pan, i. e., the balls and their bed. An examination of the latter, after six months' intermittent use shows that the two surfaces wear in such a way as to maintain their proper relation to each other. When worn too thin, the bed can be removed and replaced by a new one with very little trouble. The screens are much less exposed to injury and wear, and are readily detached and renewed, any desired mesh being adopted.

The only other apparatus employed in the process is a novel form of amalgamator. The stream of pulp, without any addition of water, flows into the hopper of this amalgamator.

This machine consists of a series of shallow dishes, attached one below another to a central revolving shaft, and inclosed in a fixed circular casing, which is kept under lock and key. Secured to the inner side of the casing, and alternating with the dishes, are slightly inclined shelves, also amalgamated. The pulp fed into the amalgamator enters the first dish, in which it is revolved until impelled by the centrifugal motion over the edge of a dish. It then falls on one of the shelves and is thus conveyed to the center of the second dish, there to undergo similar treatment. This is repeated to the end of the series, where the tailings escape. The free gold and silver contained in the pulp are completely arrested by the amalgamated dishes and shelves.

The very high efficacy of this patent amalgamator is apparently due to several causes. In the first place, the ore is reduced in the pan to such a degree of fineness that all precious metals not actually in chemical combination are set free. Then the shape of the dishes and the manner and speed of rotation all tend to insure intimate contact between the atoms of precious metal and amalgamated plates, so that the finest particles of float gold are retained, and the gentle attrition of this flowing pulp maintains the amalgamated surfaces in a constantly bright and favorable condition. Any amalgam which may have become detached is caught in a wall at the bottom of the machine.

An average of a number of samples of ore, refractory in its character, showed a result of 91 per cent extracted, and with free gold only the percentage was much higher. The inventor claims to be able to extract nearly all the gold even from pyritic ores, without calcination; and claims also, that in some instances it will be found more advantageous than chlorination.

FIG. 2.—JORDAN'S CENTRIFUGAL AMALGAMATOR.

FIG. 3.—INTERIOR VIEW OF JORDAN'S AMALGAMATOR.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

La-sen County Mining Interests.

[By Our Traveling Correspondent.]

About 12 miles west of Susanville there is a mineralized belt that carries a fair per cent of copper, and in consequence the place is called Copper Vale.

Here, years ago, a copper company took hold of the copper deposits, but had not got fairly under way when the bottom dropped out of copper and the business was abandoned. The copper is said to carry a sufficient percentage of gold to cover all expenses; if so, with the new system of electric separation, this ore could be worked to a big profit as a smelting proposition.

The Spanish Copper Ledge.

Barrett & Lathrop are proprietors of this property. It is situated about two miles southwest of Copper Vale, and owes its name to the fact that it was first discovered and prospected by Spaniards in search of gold. The vein runs from 15 inches to 2 feet, and crops for 300 feet on the ledge. The only development consists of an eight-foot shaft, but the mine is not a copper nor a gold proposition. While the vein matter carries a small percentage of copper, it carries a large amount of antimony and is a vein of antimony ore, with a small percentage of silver and copper.

South of Clear creek a mountain breaks through the lava that carries a belt of porphyritic slate, 300 feet in width throughout the entire length of the mountain. At the junction of this porphyry with the slate, a crop of iron crops and follows the course of the junction. The decomposed porphyry prospects in visible free gold. It is a question whether this gold comes from this porphyry belt, as in the mines at the Strawberry district, Dakota, where the whole mountain of porphyry is gold bearing, or from the contact vein which undoubtedly underlies the "iron belt." There are no miners in this section, and in consequence, very little if any prospecting done. There are the usual mining fables of the "White Mole Diggings," rich float, etc., but nothing has ever been done, nor is likely ever to be done in the way of developing the mineral resources of this section by the people in it.

La-sen is a county that has some fine little valleys, but the greater portion of the county is a rocky waste, almost the entire surface of the county is covered with lava, and even the hills are composed of the lava. It is a rare thing for ore of the original hills to break through this lava flow and in consequence there is very little mining ground.

E. H. SCHAEFFLE.

Native Alloy of Nickel and Iron.

EDITORS PRESS:—In your issue of Sept. 26th, I notice an article on a native alloy of nickel and iron found in New Zealand, and supposed to be a new discovery, to which mineral the name "Awaruite" has been given.

The same mineral was found by the writer during the summer of 1859, on Trinity Bar or Fraser river, about five miles below Fort Yale, in the sands of the bar, and associated with gold, platinum, magnetic iron, titaniferous iron and an abundance of garnets. The grains were small and flat, seldom over one-sixteenth in extreme length, of a steel-gray color with a faint bronze tinge, malleable and strongly attracted by the magnet. An analysis by the writer gave nearly identical results with those quoted: Nickel, 70 per cent; iron, 30 per cent, and a trace of copper.

Some years afterward, samples of this mineral were sent to some of the savants of San Francisco for examination, and I believe a paper on the subject was read before the Academy of Sciences, and the mineral was dubbed *Fraserite*. Subsequently (during 1873) I gave to Prof. Whitney, then in charge of the Geological Survey of this State, samples of the nickel-iron, with other minerals accompanying it, who sent it East to Prof. Gibbs for analysis, but while the general composition as above mentioned was confirmed by him, no full report was ever rendered to the donor, who still claims the honor of the discovery. It is doubtful if it was a new mineral, as Prof. Bishop, in his "Geognoside," mentions the occurrence of a similar alloy in Brazil and also in the Ural mountains.

On Fraser river it was found on all the bars between Fort Yale and Fort Hope, but never *in situ*, but is not easily noticed, being mingled with sands similar in color and specific gravity. Platinum in fine grains and scales, although by no means rare in the same region, has seldom been noticed by men of science.

There is strong probability that the nickel-iron will be found in Trinity river or in the bench and beach deposits near its mouth; but it is not likely ever to become of any practical importance.

A small amount of the mineral is yet in the possession of the writer, from whom small samples may be obtained.

J. A. EDMAN.

Meadow Valley, Plumas Co., Oct. 1, 1891.

THE natural gas well at Sacramento was sunk 920 feet, when the contractors quit because the piping became edged. There is a fine flow of water and about 2000 feet of gas a day. Money is lacking to complete the work,

Birds for California.

F. Reiser, of Santa Cruz, writes to the *Scientist* in this interesting manner: The other day I read an article in your paper copied from the *Bulletin* about the importation of song birds from Germany. I am very glad that the advance guard of these birds will soon be here, and the beautiful gardens and hills of lovely Santa Cruz will soon be filled with the songs of these birds. From the beginning I have been deeply interested in this "novel enterprise," and have done as much as I could to further the same. I have had several conversations with Mr. Robison (not Robinson), the San Francisco bird dealer, and at his request mentioned to him the kinds of birds best suited for importation. Last January I also published an article in the *Bulletin* and the *Call* describing these kinds of birds (of which I have been an enthusiastic student since the days of my infancy), and also showing the advantages which they may bring to our orchards, vineyards and farms. And imagine the pleasure every lover of nature would experience in hearing from the brush, the hedges and gardens the song of the nightingale, the black cap, the robin red-breast and other sweet songsters, while from the distant woods would come the answering notes of the thrush, the sweet mavis of the poets!

Among the insectivorous or soft-billed birds, as very useful and suitable for importation, may be mentioned the following kinds: The so-called grasshopper warblers (*Sylviidae*), the gnat catchers (*Muscicapidae*), the titmouses (*Paridae*), and the thrushes (*Turdinae*). The *Sylviidae* are a large family of most beautiful singers, similar to our wood warblers (*Holotilidae*), although superior in song; but not only are they good songsters, but also very useful birds, living only on insects and their larvae and small worms. As belonging to this family may only be mentioned the nightingale, robin red breast, the black-cap, the white-throat and habbling warblers and many others. The *Paridae* are beautiful birds, though not very prominent in song. They travel in swarms from garden to garden, picking diligently the insects and their eggs from the trees and from under their leaves. About seven or eight species belong to this family, and they are all considered to be most useful, especially for the destroying of the insect pests of the orchards. I was therefore greatly surprised to read in that article of the *Southern California Horticulturist*, who set loose several (?) titmouses in his orchard and calculates that they ate or destroyed fully ten per cent of his fruit crop. I have never heard of such a thing before nor seen any titmouse eat any fruit. Only in winter, when insects are scarce, they allow themselves to eat besides insect eggs some kinds of seeds, as hemp, sunflower seeds, etc. As for the *Turdinae* (thrushes), they live not upon insects that infect the trees, but satisfy their appetite from larger insects and worms living on the ground. Although very good singers, they may do some damage to the different kinds of berries.

Among the granivorous birds may be mentioned the finches (*Fringillinae*) and larks (*Alaudidae*). They live upon seeds and grain, using insects only for feeding up their young. The fame of the sky-lark is world wide. Among the finches the best known are the goldfinch, oatfinch, bullfinch, siskin and linnet. They are bright in plumage, and all more or less good singers, except the bullfinch, which has, though, a wonderful faculty to learn to whistle songs. I noticed that in the article of the *Bulletin* the goldfinch, bullfinch and sky-lark are counted to the "soft-billed birds." This is a mistake, as they belong to the granivorous class.

According to my judgment all these birds would thrive very well in this State, and especially around Santa Cruz. I have kept thrushes, goldfinches, linnets, siskins and larks in San Francisco in cages for years, and they did very well, singing like in the gardens and beautiful woods of distant Germany.

But in looking for help and enjoyment to these foreign birds, let us not forget to do homage to our own. We also have warblers and finches in great numbers. I have made careful observations and found the avian fauna, especially of Santa Cruz, to be very rich. Blue birds, brown thrushes, gnat-catchers, warblers, horned larks, vireos, cross-bills, linnets, wild canaries (siskins), song sparrows, black-crested flycatchers, orioles, blackbirds and many others are here in great numbers, as also swarms of titmouses, which I have watched flying from tree to tree, doing their good work. Most of our California birds are beautiful in plumage and are good singers, but for us, it is to protect them and give them shelter for bringing up their young. There are especially two enemies, which bring destruction to our sweet singers, i. e., the cat and the heartless boy with the slingshot. The cat is the deadliest enemy of the birds, and wherever there is a cat in a garden it is next to impossible for the birds to raise their young. The cat kills everything being of bird, young and old and living, and some cats kill more young birds in a year (roaming through the gardens and fields) than mice in their whole life. Therefore, every lover of birds must keep his garden clear from the cat and the boy with the slingshot. Wooden boxes, about a foot square, and with a hole just large enough for the bird to slip in, should be hung high up in the trees, in which the birds could build their nests.

Mail Delivery in Rural Districts.

Almost from the beginning of his term as Postmaster-General, Mr. Wanamaker has felt that with the liberal additions to the postal facilities to cities, the extension of the service into the country was perhaps being neglected. He early conceived the idea, therefore, of furnishing the free delivery service to villages and farming districts, in a way not only to supply the inhabitants of these communities with the best postal service, but to cause little or no expense to the Department in the end. He secured from the last Congress an appropriation of \$10,000 with which to try this free delivery experiment. This money was to be spent as in the case of the money appropriated for the regular carrier service of cities and towns; but the Postmaster-General was allowed great freedom in the selection of the communities to be served and in the methods to be pursued.

He promptly began the selection of villages and farming districts upon the application of the inhabitants of these communities. The nature of the service was not generally known, and it was not until after members of Congress had been requested to name certain communities which they desired to receive the benefits of the experiment that the total of \$10,000 was finally disbursed. The sum used in each community was something over \$200. It is now seen that the experiment might have been applied to a larger range of communities and might in general, therefore, have been made more nearly a complete success, if it had been possible to regulate the sums expended according to the different sizes of the communities.

But with the means at his command, and with the prescribed methods set down, the Postmaster-General went to work to put the experiment into effect. The postmasters at the different places where carriers have been put on have watched the operations of the experiment closely, and have from time to time reported their successes to the Postoffice Department. In the 40 or more towns where the experiment has been in operation, it is found that the revenues of the offices have been greatly increased, and that while in some cases they have not entirely met the expenditure, yet in every case the receipts have been greatly increased, and it is believed that, on the whole, the total of extra income from the whole number of towns will almost, if not quite, equal the total expenditure of \$10,000. In many of the places the experiment has only been on trial for a few months, and consequently its full benefits to the people served, and hence its full revenue-producing power, cannot be fully calculated.

The Postmaster-General is now about to examine the reports from all the communities for the purpose of digesting them and of making his recommendation to Congress. He has steadily believed all along that a principle would be discovered in these experiments by which, when a certain area and a certain population to be served are taken into account, a certain increase to the postal revenue in that community may be counted upon with almost mathematical certainty. The principle, if it can be discovered and set forth clearly, can easily be seen to be susceptible of forming the basis of a regular mathematical scheme, by which, when it is known what certain areas and populations are, Congress may confidently appropriate money to be expended in the right proportion, on the reasonable certainty that the increases in revenue will almost if not quite make up for it.

THE WHEELER CONDENSER & ENGINEERING COMPANY has recently filed articles of incorporation with the Secretary of State, at Trenton, N. J. The company has bought out the entire plant and business of the Colwell Iron Works at Carteret, N. J., which is one of the largest concerns in this country manufacturing vacuum pans and special machinery for sugar refineries, salt works, condensed milk factories, etc. The Wheeler Company will continue to manufacture Wheeler's patent surface condensers and other of his specialties. The capital stock of the company is \$300,000, and the incorporators are as follows: Fredk. Merlam, Wheeler of Montclair, N. J.; Aaron Vanderbilt of New York City; Clifton H. Wheeler of Brooklyn, N. Y.; Wm. H. Hampton of New York City, and Charles W. Wheeler of Brooklyn, N. Y. The headquarters of the company will be at 92 and 94 Liberty street, New York City.

ARIZONA MINERAL WEALTH.—Hon. N. O. Murphy, Acting Governor of Arizona, in his annual report to the Secretary of the Interior says that mining has always been the foremost wealth producing industry of Arizona, and the report says that during the last year it has been very active. The mineral output of 1891, it is thought, will exceed that of any previous year. The Acting Governor estimates the copper output at 30,000,000 pounds, the gold output at \$1,132,955, silver, \$1,683,585. During the year very valuable deposits of superior onyx have been discovered, and the quality is said to be first class.

ACADEMY OF SCIENCES.—The California Academy of Sciences met Monday evening, with Dr. Harkness presiding. The following were elected members: President, David S. Jordan of Stanford University; Joseph Swain, professor of astronomy; Charles H. Gilbert, professor of zoology, and D. H. Campbell, professor of botany, all of the same institution,

Very Low-Grade Ore.

A mine to be a good "company mine" should be a large one and worked on a large scale, writes Albert Williams in the *Engineering Magazine*. In order to pay dividends on shares numbering from 100,000 to 1,000,000, the profits have to be considerable or the dividend per share becomes insignificant and disappointing. It is seldom, for instance, that the California corporations, operating mines mainly in Nevada, offer their shareholder less than 25 cent dividends, which on the usual capitalization of \$10,000,000 in 100,000 shares would mean the very respectable sum of \$25,000. One such dividend a year would be a creditable exhibit for a mine owned by one or two persons. Thus, to be a promising purchase for a proposed corporation, a mine ought to be one which can be worked by a considerable force to insure steadiness of output. A rich but narrow vein where only a limited number of men have room for stopping may be the best for individual ownership, since running expenses are low, and it is not so good for a company as a large deposit of lower grade, capable of being extensively opened and presenting large breasts in the stopes, with a more regular output. The most reliable gold mines have been of very low grade, but with large and regular deposits. In California \$15 a ton is considered a very fair basis for a company mine if the ore is in quantity; but a very much lower tenor has been worked with great profit in the exceptionally large deposits of the Black Hills and Alaska, where \$5 a ton would leave a liberal margin for dividends. In fact, most of the famous mines have not been of high grade, the gold ore rarely showing any metal to the eye, so that most miners have a prejudice against what are called "specimen mines." The same holds to a less extent with the silver and ore mines. On the Comstock, the heart of "the big bonanza," the greatest ore body ever known, averaged only \$89 per ton, including the rich streaks, and that was thought to be very high. The great silver mines of Montana have not averaged anything like as much. There have been exceptions, notably in Arizona, Colorado and Utah, where high-grade ores in comparatively small amounts have produced largely; but, speaking generally, the celebrated mines have not been of that class.

Utilizing Waste Steam.

Mr. S. L. Coburn, of Battle Mountain, Nevada, has patented a device whereby waste steam can be utilized from a locomotive when stopping at a way station for the purpose of taking in wood, water, or other purposes, the steam saved being used to pump water for the tanks or reservoirs about the station. Customarily each large station has to be supplied with an engine and steam pump, and then use fuel for making steam. In this case Mr. Coburn claims that the first cost of improvement will be less than that for the ordinary steam-pumping arrangements now in use (which latter requires an attendant more or less of the time) so that more than the entire cost of steam will be gained in applying his apparatus. It has been tested and the inventor is satisfied of its practicability.

THE AUTOMATIC REGISTRATION OF RIVER PROFILES.—An ingenious instrument, by means of which the profile of a river bed can be taken automatically from a boat at the rate of 3½ to 6½ miles per hour, has been invented by a German engineer, Herr Steichner. The apparatus consists of a curved arm, which is hinged at its upper extremity, and is so long that the lower curved portion trails on the bed of the stream. As a matter of course, the deeper the stream the greater will be the inclination of the arm, and hence, by suitable recording mechanism, the depth can be automatically registered on a revolving drum as the boat proceeds on its course. The instrument has recently been practically tested on the Elbe, when soundings were taken over a distance of 297 miles in ten days.

GEOLOGY IN WASHINGTON.—A dispatch from Tacoma, Wash., says State Geologist Bethune has decided to immediately close the office of the State Geologist, as there is no money available for continuing it. Bethune says he will resign his office as soon as he has completed his annual report. He is thoroughly disgusted with the failure of the State to provide funds for a geological survey, and as his salary is only \$100 per month, he will retire to private life.

MECHANIC'S FAIR.—At a meeting of the Mechanic's Institute Trustees last week, a statement from the Treasurer showed that the total receipts of the fair amounted to \$47,946.58, derived from the following sources: Sale of tickets, \$41,172.68; privileges, \$5838.50; gas and labor, \$323.10; catalogues, \$12.30; donations, \$600. The expenses are estimated at \$29,000, leaving a net gain of \$18,946.58.

PRESIDENT THURSTON, of the Jersey City and Bergen Railroad Company, is authority for the statement that his company and the Rapid Transit Company, of Newark, N. J., have been in conference with a view to establish an electric road between Jersey City and Newark. If it is built, the road will be one of the longest electric lines in the country, with the enormous capital of \$25,000,000.

MARIN COUNTY COURT HOUSE, SAN RAFAEL.

Marin County.

We give herewith a handsome picture of the Marin county courthouse situated at the county seat San Rafael, one of the most picturesque and popular towns in the bay region of California. The *Illustrated Pacific States* in its September issue pays much attention to the interests of Marin county, its towns and beautiful suburban residences and resorts, and we take therefore this view of the county's temple of justice and some general notes on the county.

The fame of health-restoring, pleasure-giving San Rafael and picturesque Sausalito leads many short-sighted persons to the conclusion that Marin county exists simply as a sort of geographical casket to contain these beautiful gems. Nothing could be more unfair to this garden spot of California, for such Marin county surely is.

That, despite the countless columns of descriptive matter, which have been printed regarding Marin, thousands upon thousands of acres of the finest dairy or grazing land in the State is for sale at almost a nominal price, within 37 miles of San Francisco, certainly proves that a vast number of people are still ignorant of Marin county's resources.

Here is a county containing 350,000 acres, or nearly 600 square miles, with a soil which, it is now known, is capable of producing not only potatoes, grass and grain, but also nearly all the smaller fruits to perfection, and yet, which, up to within a very few years, has been devoted exclusively to one industry, namely, that of dairying. But though dairy-farming will undoubtedly continue to be the leading industry of the

county, Marin is, nevertheless, awakening to her wonderful possibilities in other directions, and thousands of acres which have heretofore lain idle as prospective grazing land, are now turning their rich soil up before the husbandman's plow, and other thousands of acres of rolling uplands, which have been abandoned to underbrush, are now covered with vineyards as luxuriant as the vine-clad hills of France.

Marin county is a peninsula formed by Sonoma county on the north, by the bays of San Francisco and San Pablo on the east, by the Pacific Ocean on the west, and by the Golden Gate on the south. The extreme southern portion of Marin county is but three miles distant from San Francisco, a proximity which contains a world of significance from a commercial point of view.

COAST FORMATION.

Being peninsular in form to an accentuated degree, Marin county would of necessity possess a generous coast line, but this boundary is rendered far more extensive by the indentations caused by Tomales, Drake's, Limantour, Bolinas and Richardson's bays. All of these bays are navigable for ordinary coast schooners, while Richardson's bay will accommodate vessels of great burden. It will thus be seen that there is no lack of transportation along the entire coast. The most important of the bays above mentioned is Tomales bay, located in the northwestern portion of Marin, 45 miles north of San Francisco. It is a beautiful sheet of water, 18 miles long, with an average width of about a mile and a quarter. It is completely landlocked, extends almost to the middle of the county, and can be entered by ships drawing 20 feet of water. The advent of the North Pacific Coast railroad, which skirts its eastern shore, has deprived Tomales bay of most of its commercial importance, but the extreme beauty of its surroundings, its safety and its freedom from winds will ever render it a favorite resort for

the camper, sportsman and excursionist, TOPOGRAPHY AND CLIMATE.

Level land is at a decided premium in Marin county, all her valleys being extremely narrow. The general formation consists of a succession of rolling hills and uplands. It must not be inferred from this, however, that tillable land is scarce, for the land of these gently undulating hillocks is as fertile and productive as can be found in the State. Along the shores of San Francisco and San Pablo bays are probably 25,000 acres of salt-marsh land, which, until recently, has been regarded as so much waste territory. Its reclamation has, however, been demonstrated, and it is being rapidly converted into excellent meadow soil.

Running the entire length of the county, from the north to the Golden Gate, is the great climate-maker, the Tamalpais ridge, a spur of the Coast Range. This ridge it is, which, forming a natural barrier against the raw winds and fogs of old ocean, gives to the interior of Marin a climate which the "globe trotters" insist is unsurpassed on the shores of the Mediterranean, or in the isles of the sea. Marin boasts no rivers, but irrigation is never required, the annual rainfall, together with the humidity of the atmosphere, resulting from the proximity of ocean and bays, giving all the moisture necessary for agricultural and horticultural purposes.

Lick Observatory.

A Scheme to Arouse Public Interest.

For some time the astronomers in charge of the Lick Observatory have complained that they have been seriously hampered in their work by a shortage of funds.

In speaking of the matter to a *Chronicle* reporter, Prof. E. S. Holden remarked that the interest on the sum left over by the late James Lick in his endowment gift—about \$100,000—does not begin to provide the means to utilize the great instrument on Mt. Hamilton, and, indeed, is scarcely sufficient to do more than

to publish the mere results of the work done. The elaborate plan of securing and reproducing lunar negatives and other enterprises of a like nature are items of expense not met by the funds at the disposal of the Regents.

Prof. Holden called these facts to the attention of Regent Phelps in a letter a few days ago. After giving the subject the serious thought which it demanded, Regent Phelps has outlined a plan which in all probability will be submitted to the Board of Regents at its meeting on Tuesday next. Mr. Phelps described his scheme to a *Chronicle* reporter.

"I have always been disagreeably impressed with the fact," he said, "that thus far the scientific triumphs and marvelous results made by the Lick telescope have occasioned more interest abroad than at home. Why this should be so I do not know. To offset this apathy, Prof. Barnard planned his series of lectures throughout the State to popularize astronomy. Now that the observatory requires more monetary assistance, I propose that those persons who are interested in astronomy shall be brought into direct contact with the observatory by means of an association—a Lick Observatory Association. The society would be composed of contributing members, who, upon the payment of initiation fees and small monthly or quarterly dues, would become entitled to directly share in the splendid privileges now withheld from the general public purely through a lack of funds.

"In such an event the privileges would be many. The members would become entitled to receive the interesting bulletins and valuable reports issued by the astronomers, as well as reproductions of the lunar and other celestial photographs being made. Each member might, upon entering the association, be given a parchment certificate of affiliation. By this method we would soon have a community of students taken from the people at large, and California would receive an intellectual stimulus quite in keeping with the advancement of the State in other lines. I am very much impressed with the entire reasonableness and efficacy of this enterprise."

ONLY California building material is to be used hereafter on the construction of Federal buildings in this State, and a collection of good building stone is being made for the Government.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—Cor. Amador *Ledger*, Oct. 10: Our mines are looking up. At the Wildman they are making preparations for sinking another 100 feet, and expect to begin next week. Superintendent Tregloan and Sidney Higgins, the foreman, feel confident that they can run the mill and sink at the same time, which will enable them to pay the expense of sinking from the product of the mine. The work of raising the rock-crusher and making other improvements about the hoisting works is about finished, and everything is in good shape for the winter. S. D. Valentine has returned from a two-weeks' visit to San Francisco, and reports everything encouraging about the Hector. Surface work is to be continued; the mill will be kept running steadily. The water will be taken out of the shaft and the property explored in the lower levels as soon as they can get at them. Repairing at the Lincoln is completed and the mill is now in good shape for the winter's run. Improvements are still being made at the Belmont, and everything is said to be looking well.

PLYMOUTH CONSOLIDATED.—*Ledger*, Oct. 10: The force of miners at this mine was increased last week by eight. Twenty stamps of the mill are now dropping, with the indications of continuing for some time.

NEW YORK.—Everything is hustling at this claim, three miles southwest of Jackson. The building they are putting up is 80 feet long by 30 feet wide, sufficient for a 20-stamp mill. The building is about ready for roofing. The large six-foot Huntington roller quartz mill will be on the ground as soon as the workmen are ready for it. It is to be supplied with Woodbury concentrators, and run for 30 days on trial, and if the result is satisfactory, another mill of the same kind will be erected. If the test does not come up to expectation, probably ten stamps will be put in, and the roller and stamp mills run side by side, on the same character of ore, which will prove beyond all question which kind of plant is better adapted to treat the ores of that section. W. G. Anderson, the superintendent, says there is abundance of rock to keep a 40-stamp mill going.

ONEIDA.—Robert Robertson, formerly superintendent of this property in its active days, has secured a lease or bond of the mine, and will take charge next Wednesday. We are not in a position to say what this change means. The Oneida naturally assumes greater importance from the fact of the bonanza met with in the Kennedy teedog in that direction, and also the fact that the southern portion of the Oneida—joining the Kennedy—has never been prospected. We look for the reopening of the Old Oneida ere long, and after long years of idleness it may prove, like its neighbor the Kennedy, a rich dividend-payer to the company that undertakes its further exploration.

MISCELLANEOUS.—The Clifton Consolidated has declared its eighth dividend of 10 cents per share, payable on and after Monday, October 5th. Improvements continue to be made at the mine. A heater for the chlorination works went up on Tuesday. Mr. Hazleton, one of the proprietors of the San Francisco *Post* was up a couple of weeks ago on business pertaining to the mine. Geo. Thomas, who has been operating the White claim between Jackson and the Gate under a bond for some months, is having some rock hauled to the mill of the Amador gold mine for a test crushing. The Zelle has added considerably to its force of miners the last few days. Many of the new hands are from Colorado, as the miners do not care to face winter in the mountain camps of that State. The mine is said to be looking well, the ledge at the 1000-foot level showing up in immense strength, and with less waste than in the levels above.

Butte.

PALO ALTO.—Oroville *Register*, Oct. 8: L. H. Ayers came down from the Palo Alto mine last week and went to San Francisco on Friday, but returned on Saturday night. He tells us that 25 men are at present employed in the mill and mine and that the 20 stamps will be in running order in about two weeks. The water to run these stamps is brought in under a pressure of 125 feet, and a hurdy-gurdy wheel with Knight buckets is used. As soon as the new mill is ready to start, a Pelton wheel will be used instead of the present hurdy which has run the ten stamps of the old mill. He says that some 12 men are employed at the American Eagle mine, and that about 20 others are prospecting in the neighborhood. It is reported that very rich rock has been struck in the A. E. mine, and the mill is turning out gold rapidly.

Calaveras.

GOLD.—*Prospect*, Oct. 10: Calaveras takes leading rank among bullion producing counties, and the shipments for the past week have kept Wells, Fargo and Co.'s messengers pretty busy. No one outside of those directly concerned knows the exact amounts, but from Sheep Ranch and Angels have gone during that time over \$50,000. The Enright mine and mill at Railroad are running now on full time, about 20 men being employed with prospect of more. The mine is looking well and Mr. Enright, the owner, seems confident. It is said that Mr. Bennett is getting ready to start up the Lockwood mine at West Point. A new company has taken hold of the Woodhouse mine at West Point and it is reported that two tunnels will soon be run. The Graves mine at West Point is looking well, the last rock taken out assaying \$98 per ton. The personal property on the Pioneer mine at Angels was sold at auction, Tuesday, to satisfy a judgment.

CAMPO SECO.—Flattering reports still continue to come in from this rising camp. The smelting works are nearly completed, and as soon as they are completed, work is to be commenced on the hoisting works. These mines promise to prove equal to those at Copperopolis in a short time.

WELL SATISFIED.—Colin Campbell, the owner of the now famous Washington mine, went below Sunday. He looks happy and contented, as well he may be. It is not every mine that pays all of its bills from the start as this has done, and there is more than enough in sight to finish the mill.

Humboldt.

THE PRESTON MINE.—Blue Lake *Advocate*, Oct. 3: The people of Blue Lake are naturally interested in the development of the Preston coal mine, on Maple creek. The scene of operations is only about 14 miles distant, and if a good quality of coal should be found there in inexhaustible quantities, the whole county would experience a sort of boom, and our town certainly receive her portion of benefit therefrom. The vein on which work was a few weeks ago begun dips at an angle, with the surface of about 45 degrees. Where it cropped out, the width was only about 2½ feet; but as the workmen descended, the vein grew wider, and it is learned from a gentleman who came down from Maple creek this week that the vein at the depth now attained has a width of seven feet, and there is a noticeable improvement in the quality of coal taken out. The crew is sinking a shaft 6x14 feet, and it is proposed to prosecute operations until the extent of the vein or veins, for there are several, and the character of coal shall have been accurately ascertained. If the coal should prove not first class, and yet make fairly good fuel, it would, if existing in inexhaustible quantities, still be a bonanza for Humboldt county. As a matter of fact, no really first-class coal has ever yet been discovered on the Pacific Coast, and still the deposits in Washington State have proved as valuable to their owners as a gold mine.

Nevada.

THE COE MINE.—Grass Valley *Telegraph*, Oct. 10: Mr. Robert Stevenson is here, and the gentleman is representing the interests of the parties who have bonded the Coe mine. There is general satisfaction all around concerning the looks and prospects of the mine, and just now a crushing is being taken out and will be put through the Crown Point mill. The ore looks well, and the crushing is expected to make a good yield.

MILL STRUCK.—*Telegraph*, Oct. 8: This morning (Thursday) the new mill on the W. V. O. D. mine started up. Everything worked to a charm and the mill will be kept steadily going. There is already enough ore of the best milling quality on hand to keep the mill going for a month or more without hoisting any quartz from the shaft.

Plumas.

THE ARGONAUT MINE.—*Plumas Co. Bulletin*, Oct. 7: Messrs. Foss & Mechin began the development of a drift-gravel mine about three months ago, in Grizzly ravine, near Dutch Hill. During this time they have run a cut and tunnel 100 feet, cutting through the rim and into the bed of a channel. The gravel prospects well, and will pay good wages now for working. They are making numerous improvements preparatory to winter work. This is a section of country which Mr. Mechin has long desired to prospect, being confident that he could find a rich deposit of gold in it.

San Diego.

GOLD GALORE.—*Julian Sentinel*, Oct. 10: The famous Helvetia is sailing under a lucky star. Three weeks ago we had to chronicle a valuable strike in this magnificent property, but to-day the words used on that occasion would ill portray the truth. Two days ago, and while following the rich vein mentioned formerly, and when about 50 feet from the point where the gold quartz first came in, the vein developed a surprising richness, exceeding anything seen in the mine before. In the breast of the drift, at the end of the 225-foot level, there was taken out pieces of the richest ore, some of which same ore will be on exhibition at the county fair, together with samples of the former strike. On the upraise at the point of first contact with rich ore, the men have dug out a distance of 20 feet, and the ore taken out shows no diminution of gold. The first strike was rich beyond the expectations of its owner, but this new find surely places this mine within the limits of a bonanza. The Cincinnati Belle has some wonderfully rich rock in both the upper and lower levels, the 150-foot level being particularly fortunate, and the best rock even here lies at the bottom. Under the direction of W. D. Chambers of the Ruby Company, this splendid property is making great strides. The lower drift is now in about 150 feet, and the ore is getting richer and the ledge widening. About 50 feet of this ledge is now ready for stopping, and ore will be taken out as soon as the necessary cars and other appliances can be had. Mr. Chambers deserves great credit for the work he has accomplished under the many difficulties he has had to contend with.

Shasta.

COAL AND IRON.—*Shasta Democrat*, Oct. 7: Last week a gentleman from Pennsylvania, whose name we failed to learn, came out here with a view of investigating the iron and coal deposits in the Pitt river region east of this city. On inquiry about the discoveries, he was told by some silurians, that the deposits were "N. G.," and that he would waste time and money by investigating. He did not heed their views however, and set out to make a personal investigation. The result was, that he sent some of the ore to his company in the East. They reported that the iron ore contained 75 per cent of iron, and the coal was just what was needed. The gentleman thereupon purchased a large tract of land covering the iron deposits and is negotiating for some coal land. He says if the railroad company will not build a road to the mines, his company will. This will open up a grand industry for Shasta county, and as Redding is the nearest and most practical route to the mines, we will see a second Pittsburg raise up before us before many years have rolled around. With this, and a road running out to Eureka, Redding will become one of the most prominent towns on the coast in a few years.

Siskiyou.

SAWYER'S BAR.—*Yreka Journal*, Oct. 7: Our Sawyer's Bar correspondent, D. C. P., writes us that the gravel mining industry of Salmon river is being reviewed by the contemplated construction of an extensive ditch or canal from the headwaters of the north fork, for the purpose of conveying water along the mountain-sides at a high elevation in order to obtain hydraulic pressure for the profitable working of the extensive high gravel bars that exist all along the course of the river, which have lain dormant awaiting the touch of capital to convert them into paying properties. Wherever these bars have been accessible for even a small amount of water during the springtime, they have been worked very profitably and were thoroughly tested, leaving no

doubt as to the success of the company who have undertaken such an expensive enterprise. Once the success of this company is assured, no doubt other enterprises of the same sort will follow, as the main course of the Salmon is covered with high gravel wash, containing gold in paying quantities, but lacking the capital necessary for utilizing the water privileges for development.

QUICKSILVER.—The new furnaces of the Siskiyou Quicksilver M. Co., located on the west side of Beaver creek, in this county, were finished the first of last week, the castings having been hauled to the mine from railroad via Oregon. The furnaces were soon dried out by building fires in them, and in about ten days more their first cleanup of quicksilver will be made from a large quantity of cinabar on hand. The surface ground in the vicinity has been sluiced off by the hydraulic process, securing a great quantity of float cinabar and exposing several chimneys of very rich ore ranging from 6 to 8 feet in thickness.

BLUE GRAVEL.—Lee, Lash & Co. have found exceedingly rich pay in the blue gravel much higher above the bedrock than in their old shaft, which was totally unexpected. They are sinking down on the new shaft, however, so as to drain the bedrock, which is about 15 or 20 feet lower than the first shaft sunk further up Greenhorn creek. This company, who started again in successful breasting from the new shaft, will take richer pay than ever, as the blue gravel strata containing gold is much thicker and more extensive than at their old stopes and drifts. The Yreka Blue Gravel Co. still continue to find favorable indications of nearing bedrock, where the blue gravel is getting softer and contains gold to some extent. Their shaft is now down about 175 feet, and when reaching bedrock feel confident of striking rich pay. If so, a tunnel will be run into the mountain from Yreka creek to work successfully by running cars into the paying gravel bed.

Tuolumne.

STANLEY.—*Tuolumne Independent*, Oct. 10: The Stanley mine near Jacksonville, under the able management of Mr. Frank McCann, is in active development. It is on the mother vein belt and the ledge is 200 feet in width, with thousands of tons of ore in sight—an immense body. The rock is very similar to that of the famous Utica mine at Angels. Mr. James Tullock, an experienced mining man, familiar with the mines in both counties, thinks the ore is the same or a little better than the Utica. Mr. Tullock has explored the Stanley mine thoroughly, and considers it the biggest thing struck in this county; "one of the biggest prospects I ever saw in my life," said he; "splendid prospect, worth thousands, wish I owned it." He is putting one of his concentrators in this mine. They are now running a tunnel and will have 700-foot backs. It is 2700 feet to the Tuolumne river, and they will have all the water they want, and are now constructing a ditch 16 feet wide, which will be 2½ miles in length. The 10-stamp mill is merely to prospect the mine. If the ore will go \$2.50 to the ton, a 100-stamp mill will be erected at the river. The owners of the mine are San Francisco capitalists. Their success in this mine will insure the development of others.

KELTZ.—The 10-stamp mill of the Keltz mine is running lively and will continue until the water fails. The ore is looking fine. The Leechman Prospecting Co. owns and works the mine and will probably secure others in the near future.

NEVADA.

Washoe District.

CROWN POINT.—Following is a copy of the official report of the pumping operations in the Crown Point incline for the week ending October 3: The pumps have been running steadily during the week. In order to draw the drill rod out of the bulkhead, we lowered the water down to within 20 feet of the bulkhead with the sinking pumps. At 10:30 A. M. yesterday we drew the rod, and the water began flowing into the incline very freely. In a few minutes the water came up within reach of the station pumps. After starting the station pumps, we found that they could hold the water as it flowed through the bulkhead. At 8:30 this morning the water in the Belcher incline had been lowered 6½ feet since the drawing of the rod.

UTAH.—The southeast drift, 725 level, has been extended 42 feet; total length, 456 feet, in hard porphyry showing some clay.

ANDES.—On the 420 level, main north drift was advanced 20 feet; formation vein porphyry and clay. North drift from east crosscut No. 4 advanced 20 feet; formation quartz.

SIERRA NEVADA.—West crosscut No. 1 from the northwest drift, 630 level, 571 feet from the shaft, has been advanced 30 feet; total distance, 1116 feet; no change in formation. The north drift from the Kenosha tunnel was advanced 60 feet through vein formation; total, 80 feet.

UNION SHAFT.—The west drift from the shaft, 900 level, has been advanced during the past week 42 feet; total distance west of shaft 1186 feet; face is in hard porphyry.

WARD COMBINATION SHAFT.—The southwest drift from the shaft, 1800 level, is out 484 feet; face in porphyry and clay.

SILVER HILL.—The northwest drift, 50 level, is out from the shaft 290 feet; the face in porphyry. The south crosscut, 160 level, is out from the wioze 740 feet; face in hard porphyry.

ALPHA.—Are still retimbering shaft.

EXCHEQUER.—There has been no work done during the week on the 500 and 600 levels, owing to the retimbering of the Alpha shaft. The joint southwest drift from the Ward shaft, 1800 level, is out from shaft 484 feet; face in clay and porphyry.

CON. NEW YORK.—The west crosscut (No. 2), 180 feet north of shaft, 650 level, is out 46 feet; face in quartz and porphyry yielding low assays. The north lateral drift, 1100 level, is out north of shaft 712 feet; face in quartz and porphyry yielding low assays.

CHOLLAR.—The east crosscut on the south line, 1200 level, is out 70 feet; face in porphyry and streaks of quartz yielding low assays. South lateral drift from the incline station, 1500 level, is out 155 feet; face in porphyry.

POTOSI.—East crosscut on south line, 1300 level, is out 175 feet; face in porphyry. North lateral drift from winze station, 1400 level is out 122 feet; face in porphyry. The south drift, same level, is out 124 feet; face in porphyry. The south drift from wioze station, 1500 level, is out 38 feet; face in porphyry with streaks of quartz yielding low assays.

The north drift, same level, is out 35 feet; face in porphyry.

BULLION.—The joint east crosscut on the north line, 1300 level, is out 175 feet; face in porphyry. The joint south drift from wioze station, 1400 level of Potosi, is out 124 feet; face in porphyry. The joint southwest drift from winze station is out 38 feet; face in porphyry with streaks of quartz yielding low assays. The southwest drift from the Ward shaft, 1800 level, is out 484 feet; face in clay and porphyry.

AN IMPORTANT CONTRACT.—*Virginia Enterprise*, Oct. 10: The Occidental Co. M. Co., has entered into a contract with the Comstock Tunnel Co., wherein the latter company agrees to run a drift from this tunnel to connect the Occidental mine at a perpendicular depth of 1,000 feet. The drift will be started at a point in the tunnel where it cut the Monte Cristo or Brunswick lode, and will follow the lode through the St. John ground into the Occidental. This drift will prospect and develop a large block of ground that heretofore has been untouched except upon the surface, where the old St. John Co. took out many thousands of dollars in the early days. The work this day commenced is more important to the people of Virginia and the State generally than any mining work that has been inaugurated in this district since the stopping of the Combination pump. The Monte Cristo or Brunswick lode is a well defined mineral-bearing vein extending from the old Monte Cristo on the north and through the Occidental on the south, a distance of over 10,000 feet. Along the entire length, in pipes or chimneys, ore has and is yet being taken out near the surface, and the deepest workings have not reached over 700 feet. The Sutor tunnel has demonstrated beyond all question that this great vein is a true fissure of mineral-bearing rock, and it now only awaits the intelligent expenditure of money and muscle to open and uncover probable bonanzas. The finding of pay ore in the St. John or Occidental at the 1300 level would instill new life into the business of mining in this section. Every claim from the Monte Cristo to the Buckeye would be started, and an additional demand for labor, machinery and mining supplies would be created and every inhabitant in Western Nevada would be benefited. The St. John property has passed into strong hands, and our people are to be congratulated that the money to carry on the work of development has been fully provided by a party of gentlemen whose names alone are a guarantee that the work will be carried to completion in good faith and without delay.

Hawthorne District.

LAPANTA.—*Walker Lake Bulletin*, Oct. 7: Since last report the west drift from the crosscut from the winze below the 100-foot shaft level has been continued, ore still showing in the face. The ore body dips southeast below this drift and appears to be going down very strong. An independent body of ore has been uncovered immediately west of the Old Bradley shaft, and is being stripped ad followed, dipping at an angle of about 25 degrees to the west. It shows from 12 to 14 inches wide for a considerable distance, and will average about \$60 per ton. The body of ore uncovered between the Bradley incline and the mouth of the main tunnel still continues to show well, and during the week some ore which averages \$500 per ton has been extracted.

PAMLICO.—Work is being vigorously prosecuted at five points in the mine, and all points in the vein are showing very well and producing good ore.

CENTRAL.—Stopping still continues above the north drift, 150-foot level, the usual amount of ore being extracted. About 30 tons are now ready for shipment.

Jett District.

LOOK WELL.—Belmont *Courier*, Oct. 10: The mines in Jett district, Nye county, especially the Senator mine owned by Thos. Warburton, look well. A tunnel run on the ledge for 40 feet and intersecting the Senator incline at a depth of 45 feet, shows a regular vein of galena and carbonate ore of good grade. The pay streak is from 12 to 16 inches in width. The last work shows that the ledge for about 300 feet is strong and regular. In running the tunnel, several tons of ore were extracted. In any other part of the country this mine would attract attention of capital.

Jefferson District.

HARRISON.—Belmont *Courier*, Oct. 3: The silver rock from the Harrison mine, Nye county, which was recently hauled to the Sodaville mill for reduction, proved to be good ore. The Harrison Bros. inform us that this ore milled \$334 per ton. There is no doubt that Jefferson is one of the best mining districts in Eastern Nevada.

BRITISH COLUMBIA.

STAMPEDE TO SLOCAN LAKE.—*Nelson Miner*, Oct. 1: Last week Eli Carpenter and Jack Seaton returned from a trip westward from Kaslo creek, having located on the west slope of the mountain some galena ledges. Assays of the ores from these ledges gave results varying from 125 to 175 ounces of silver to the ton. Quartz gangue with but little mineral in sight yielded about 65 ounces. On Monday last Eli Carpenter and E. A. Bielenberg of Ainsworth quietly packed up their blankets and left for the Slocan river by way of Nelson. On Monday night about eight boats and probably twenty miners slipped away under the guidance of Jack Seaton and took the opposite route via Kaslo creek. As there is a little fresh snow on the divide between Kootenay and Slocan lakes, some of the boys will have a chance to "see the elephant" before they return. The rush reminds one of the early days in Cariboo when a new creek was struck in the placer regions. No doubt can now be felt that an exceedingly rich belt of galena and copper ore exist in the mountains between the Slocan and Kootenay lakes.

NOTES.—There is nothing new to chronicle from Toad mountain. The Dandy is reported as looking very well, and the crosscut in the Silver King is said to be in ore, although not of very high grade. At the Grizzly Bear the usual amount of work was done during the week. Several sales are reported, but not of claims likely to be developed into mines. The Poorman mill on Eagle creek has been running off and on for two or three weeks on ore that was extracted last year, and the mill on the Whitewater on Rover creek continues to turn out from \$50 to \$75 a day in gold bullion. Keefer and Monaghan are at work on the Muldoon. The owners of the William Wallace, happy in the belief that "the world is theirs," are doing nothing more than ex-

hibiting specimens of ore from that claim. Prof. Parks has made a second visit to the Gallup-Proctor claims, to the south of Balfour, which makes the owners think there is something in them. Prospectors are coming in from the hills and it is evident that the tail end of the season of 1891 is fast drawing nigh.

NEW MEXICO.

COPPER.—J. T. McCorkle, superintendent of the Anson S. copper mine at Hanover, was in town on Sunday and reports that he has 15 men engaged in development work and piling up ore at the mine. The smelter is not running at present. Mayor Fleming and Hank Dorsey are working the Moonlight mine at Bald Mountain and shipping the ore to the Bremen mill. They have a large body of good grade milling ore and are sacking shipping ore that runs 700 to 800 ounces in silver per ton. Jo E. Sheridan will soon commence work with a large force on his famous Uncle Sam mine in Cow Springs district, extracting ore for shipment to the Bremen mill. Several hundred tons of fair grade milling ore can be extracted easily and cheaply in a short time with a good profit to the fortunate owner. The Aztec Company's mill is running constantly on ore from the Kleptomania mine of that company. The Pacific Gold Company keep their stamps dropping without cessation on ore from their famous Pacific mine. The Bremen mill is running on custom ores and the Flagler works are running on tailings. Silver City's reduction works are the pride and hope of the town.

OREGON.

FROM THE PHOENIX.—Bedrock Democrat, October 1: That the Phoenix mine, situated in the Robinsonville district, is a permanent property is no longer a matter of speculation, but like the majority of other Baker county mines, has proven a permanent ledge. Mr. A. Hector, who is employed at the Phoenix, was in the city yesterday and to a Democrat reporter stated that the ledge had been exposed at a depth of 270 feet and a fine body of ore, four feet wide, was presented to view. The tunnel which taps the ledge at this depth is 250 feet long. The upper tunnel is 350 feet long and taps the ledge at a depth of 200 feet. At this depth the ledge is four feet solid ore and as it has been demonstrated that the ledge is of the same width at 270 feet there is no telling where the ledge ends.

ANOTHER BULLION.—The Democrat was yesterday the recipient of a pleasant call from Mr. F. C. Borden, of the Dierk mine, situated five miles south of Telocast. Of this promising property Mr. Borden said: "The Dierk mine is owned by Borden, Dierks and Toonily, and is a free milling property. We have a 75-foot shaft down the ledge and at this depth a 7-foot vein exposed, which assays \$19 per ton. A tunnel will be run in to tap the ledge at the bottom of the shaft and then we will commence drifting on the ledge. There are 200 tons of ore on the dump, and it is our intention to put up a five-stamp mill early next month. We have a fine mill site and plenty of water. Powder river running within a few feet of the property. This company is also the owner of another ledge in this district known as the Blaine mine. We have done but a small amount of development work, but the property gives promise of proving a valuable copper mine. The ore assays 22 per cent., copper."

IDAHO.

FLINT PROPERTY SOLD.—*Avalanche*, Oct. 3: Last week the deal was closed on the Flint property by the Chicago parties, who held an option on the same; \$600,000 is the price paid. Machinery has been ordered by wire, and the capacity of the mill will be largely increased. What the policy of the company will be we are unable to say, but we understand that Mr. Leech's services have been secured as general superintendent, and as soon as possible more men will be employed. The success of the Flint milling process, introduced by Mr. Leech, has led to numerous inquiries by capitalists, and a number have been making personal inspection in the South Mountain district, which is also a base ore camp. We may look for a stir in that district before many months. The Trade Dollar property is improving, and has continued to improve for some time, until now the ore has gotten to be so near the pure stuff that all it lacks is the eagle stamped on it. Of course Supt. Dewey is highly elated, as well he may be. Development work is going on all through the mine. The Seales and Wagner arrastra started up this week on Cumberland ore. This is one of the recently developed properties on War Eagle, and gives promise of being a banana. Two teams are now hauling ore from the Phillips & Sullivan mine on Florida to the Silver City reduction works. The mine is looking finely in all the workings and is a steady bullion producer.

MONTANA.

MINERS AT WORK.—As a source of information, with some little trouble and as near as could be arrived at, the following is about the number of men that are actually employed in the principal mines of the camp at the present time: Anaconda, 30; Mountain Con., 4; St. Lawrence, 9; Green Mountain, 2; High Ore, 25; Wild Bill, 35; East Colusa, 2; Mountain View, 100; Harris and Lloyd, 107; Silver Bow, East, 16; Gray Rock, West, 10; Sisters, 15; Butte Copper Company, 12; Lexington, 50; Alice, Magna Charta, Blue Wing and Silver Safe, when in operation, 150; Eveline, 1; Goldsmith, 12; Modoc, 6; West Colusa, 40; Leonard Shaft, 40; Moose, 16; Silver Bow, West, 100; Gray Rock, East, 80; Josephine, 20; Ground Squirrel, 40; Gleggarry copper shaft, 12; Moulton, 45; Gleggarry, 40; new shaft on the Silver Lick, 14; Gambetta, 40; Blue Bird, 80; new shaft on Blue Bird, 12; new shaft of the Nettie, 14; Parrot Colusa, 50; Gagnon, 80; Moscow, 25; On Butte, 6; Parrot, 80; Nettie, 80; Germania, 30; Virginus, 24; Belle of Butte, 30; Puland, 6; Pacific, 14; Homestake, 6. There are many leasers that are not enumerated that will about double the above number, and that is a rough estimate of the whole number of miners employed in the district at the present time.

The Temescal tin mine is said to be turning out about eight tons of tin a month.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING OCTOBER 6, 1891.

- 460,738.—CAN LABELING MACHINE.—H. Albert, Crescent City, Cal.
460,691.—AUTOMATIC VENT.—M. Anthony, Berkeley, Cal.
460,740.—FRUIT STONER.—J. S. Briggs, San Buenaventura, Cal.
460,914.—CONVEYER.—J. M. Finch, Crockett, Cal.
460,915.—BOLTING MACHINE.—J. M. Finch, Crockett, Cal.
460,820.—DOOR OPENER AND CLOSER.—Julius Finch, S. F.
460,724.—FINGER-BEAM ATTACHMENT FOR HARVESTERS.—H. P. Galligan, Wheatland, Cal.
460,821.—APPARATUS FOR MARKING STONE PAVEMENTS.—G. F. Gray, S. F.
460,864.—ELECTRIC SWITCH INDICATOR.—E. W. Hadley, Corvallis, Ogo.
460,748.—PASTRY SHELF.—Mary S. C. Hartmann, Redding, Cal.
460,812.—WAVE-POWER MOTOR.—H. P. Holand, S. F.
460,814.—CONCENTRATOR.—Gustav Lang, S. F.
460,757.—HORSE COLLAR AND HARNESS.—D. Paquet, Oakland, Cal.
460,758.—WATER-WHEEL.—J. B. Pitchford, S. F.
460,815.—WATER-WHEEL.—J. B. Pitchford, S. F.
460,831.—IRON OR STEEL POST.—W. E. Pedley, Prescott, A. T.
460,729.—APPARATUS FOR FEEDING SAWDUST AND SHAVINGS TO FURNACES.—Scott & Shear, Mott, Cal.
460,763.—FLOP BOARD FOR BOLTING DEVICES.—J. A. Segbers, S. F.
460,732.—ORE SEPARATOR.—H. H. Taylor, Fresno, Cal.
460,733.—ORE FEEDER.—Jas. Tulloch, Angels, Cal.
460,736.—MECHANICAL MOVEMENT.—Williams & Lash, Sacramento, Cal.

The following brief list by telegraph, for Oct. 13, will appear more complete on receipt of mail addresses:

Pacific Coast: California.—Mathew Arnold, San Francisco, elastomer for belts; Edward A. Cochran, Pasadena, combination tool; Jean B. Gerber, San Francisco, bipedodermic aerial railway; Ernst Krebs, San Luis Obispo, game apparatus; James McKee, Oakland, preserving lumber; Albert Minnick, Colton, San Bernardino, ventilating device for railway cars; James Portocous, Fresno, cultivator; William C. Roberts, Sausalito, newspaper holder; Daniel W. Smith and J. K. Hopkins, Fresno, dirt scraper; Martin M. Worburger, Round Mountain, hay-raking and elevating machine, Washington.—Fred McKinley, Acme, culinary boiler; Isaac H. Odum, Oakdale, extension ladder.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast Inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FRUIT-STONING MACHINE.—John S. Briggs, San Buenaventura, No. 460,740. Dated Oct. 6, 1891. This is an apparatus for cutting fruit and removing the stones or pits therefrom, it being especially applicable to such fruits as apricots, peaches, plums and the like.

MECHANICAL MOVEMENT.—Chas. H. Williams and T. M. Lash, Sacramento. No. 460,736. Dated Oct. 6, 1891. This invention relates to that general class of mechanical movements which may be properly termed "tread powers," in which the operation is dependent upon a continuously moving weight, such as a horse or other animal. The objects of the invention are to provide a simple, effective and economical power device, and to utilize the peculiar movement for the purpose of amusement in toys, and instruction in educational appliances for schools for illustrating the movements of orbital bodies. The device may be used for a power device for driving machinery for pumping water, etc.

CAN-LABELING MACHINE.—Henry Albert, Crescent City, assignor of one-third to Thos. R. Hayes, Pasadena. No. 460,738. Dated Oct. 6, 1891. This invention relates to that class of can-labeling machines in which a reciprocating can-puller and pasting mechanism operates within a runaway, as exemplified in the machine shown and described in the patent to the same inventor, No. 445,418, granted Jan. 27, 1891. The invention consists of certain improvements on the former machine. The general object is to provide a simple and effective machine for labeling cans, and which can be readily adjusted to suit the requirements of different sizes of cans.

CONCENTRATOR.—Gustav Lang, S. F., assignor of one-half to Livingston Gilson and Julius Jacobs. No. 460,814. Dated Oct. 6, 1891. This is an improved ore concentrator. It consists of conveying sluices with means for subdividing the flowing material and grading it progressively through the different parts of the apparatus in such a manner that the heavier particles are separated from the lighter, until nothing but waste or worthless material is left to be discharged. The great difficulty in concentrating and saving the very minute and light valuable particles, which are usually carried away with the water and waste material, makes the percentage of loss very considerable. The object of this invention is to progressively separate and convey away, first, the slimes and clayey matter from the heavier subphurates, metals and sands; second, to grade and deposit these heavier substances in strata in a pan, with a means for drawing off each different grade until every possible portion has been saved and separated from the waste material.

FLOP-BOARD FOR BOLTING DEVICES.—Joseph A. Segbers, S. F. No. 460,763. Dated Oct. 6, 1891. This invention is designed to provide a novel

flop-board, as it is called, for flour-bolting devices. These flop-boards are fitted into a channel or trough beneath the bolting reel, so that they may be shifted and change the flow of the material falling into the trough, to either one of two screw-conveyors, one of which is situated upon each side of and below the trough. In this invention the flop-boards have circular grooves in their opposite ends, which fit segmental guides so that the boards are easily shifted from side to side upon these guides and they form close joints with the rails against which they abut. Vertical partitions separate and grade the material as it falls from the bolting reel into the trough or channel, and either grade may be carried off by the screw-conveyors.

FINGER-BEAM ATTACHMENT FOR HARVESTERS.—Hugh P. Galligan, Wheatland, Yuba Co. No. 460,724. Dated Oct. 6, 1891. This invention is applied to headers in which a draper platform is located at the front of the machine, its forward side being formed and bounded by the finger-beam in which the reciprocating sickle works. The object of this attachment is to enable the sickle to cut the entire length of the finger-beam. In the present machine this is not the case, as the last finger through which the sickle passes is not at the end of the finger-beam by about a foot from it and the cutting of the sickle stops at this last finger. There is, therefore, a loss of a foot approximately at the end of the finger-beam, and the machine does not cut a swath as wide as its beam is long. In the ordinary machines the last finger is set back from the end of the beam for the reason that the draper roller is mounted between the beam and back-bar at that end, and the supporting block of the swath-board must be far enough inside of the line of this roller to allow the board to lie with its inner edge over the draper, so that the cut grain will fall upon said draper.

COMBINED HORSE-COLLAR AND HAMES.—Dimdonni Paquet, Oakland, assignor of one-half to Louis Kaser, No. 460,757. Dated Oct. 6, 1891. This invention consists in the combination with the body of the collar, of a hame, which also forms the roll, and in a peculiar means for jointing or hinging these hames, so that the collar may be opened at the bottom to place it on the horse's neck, and a locking device for securing it when it is closed together.

WATER-WHEEL.—John B. Pitchford, S. F. No. 460,758. Dated Oct. 6, 1891. This is one of that class of wheels in which the buckets are carried on the rim of the wheel and receive the impact of a stream from a nozzle under head or pressure. The objects of the invention may be generally stated to be increased capacity and a widely varying range of power. The first object is attained by bringing a large number of streams to play on the buckets at one time, and the second is gained by changing the number of streams and size of the nozzles to suit the quantity of water available.

ORE FEEDER.—James Tulloch, Angels Camp, Calaveras Co., assignor of one-half to David C. Demarest. No. 460,733. Dated Oct. 6, 1891. This patent covers an improved construction of the inclined tray or chute movable beneath the open-bottomed hopper in which the ore is placed, and in certain details of construction and adjustment. In former patents issued to Mr. Tulloch in November, 1873, and March, 1875, he showed a feeding tray and a means for reciprocating it beneath an open-bottomed hopper; but in each of these inventions certain details in mechanism and operation of the device were shown which differ in construction and operation from the present invention, and upon these differences he bases his claims for improvement.

APPARATUS FOR FEEDING SAWDUST AND SHAVINGS TO FURNACES.—Thos. T. Scott and Jacob J. Shear, Mott, Siskiyou Co. No. 460,729. Dated Oct. 6, 1891. This is an apparatus for feeding sawdust, shavings and other waste from instruments used in the manufacture of lumber or wooden articles to furnaces, where it is burnt. The device acts rapidly and economically, distributing the fine inflammable material with evenness and regularity, and the blast of air furnished causes it to burn with extreme rapidity. It is especially useful in saw-mills and other mills for working lumber in large quantities, and in which it is a serious matter to dispose of the waste. It is burned in pits or furnaces, the slabs and heavy material being brought to the furnace by a conveyor above the sawdust feeder, and the sawdust is distributed over the larger pieces by this machine, which also supplies air for combustion.

PASTRY-SHELF.—Mary S. C. Hartmann, Redding. No. 460,748. Dated Oct. 6, 1891. This invention relates to a novel construction of pastry-shelves and it consists of a series of shelves and a support or adjustment therefor. When the device is in use it may stand in a closet or any suitable place, and pies or other kinds of pastry may be placed on the shelves. When the device is out of use it may be reduced in space by taking out the shelves, separating the sides by unhooking certain rods and the sides, shelves and hooks hang up in small compass.

WATER-WHEEL.—John B. Pitchford, S. F. No. 460,615. Dated Oct. 6, 1891. This is one of that class of water-wheels in which the buckets upon the rim of the wheel receive the impact of a stream of a stream of water under head or pressure. The novelty lies particularly in a peculiar nozzle for directing and regulating the stream. It consists of a nozzle pipe fitted to a water coupling and having a cylindrical seat with a front port, an oscillatory plug fitted within the cylindrical seat and having a tapering part which forms the water exit or nozzle, and a stem connected with the plug for turning it. When the plug is turned down, the stream is taken partially out of or wholly under and clear of the buckets, thereby regulating the speed of the wheel. By turning the plug still farther down, its port is moved out of line with the port in the seat, and the stream is shut off altogether. Thus a perfect control of the wheel is possible.

APPARATUS FOR CUTTING OR MARKING ARTIFICIAL STONE PAVEMENTS.—George F. Gray, S. F. No. 460,821. Dated Oct. 6, 1891. In the customary operation of cutting or marking artificial

stone pavements it is usual, after the top dressing or layer is in place and while still unset, to place a straight edge upon it in the line in which it is intended to be cut or marked, and then with a trawl-point or other instrument to follow the straight edge and thus cut or mark the work and shape the groove. Besides the time required in laying off accurately and separately each line to be cut or marked, the old operation is further disadvantageous in that the straight edge, pressing only on one side of the cut or mark, causes the top layer or dressing on the other side to bulge up and separate from the coarse or bottom layer, thereby making the work defective in the particular technicality known as hollow. Mr. Gray now uses certain novel frames, which apparatus overcomes the disadvantages of the old method by insuring rapidity and accuracy and at the same time avoiding hollow work by preventing any separation or bulging of the top layer because during the entire operation of cutting and subsequent forming or shaping of the cut the material is pressed equally on both sides.

Mining Share Market.

Mining shares the past week had all the symptoms of going to pieces, but did not. The pool succeeded on Monday in quoting an advance of about five per cent over Thursday's quotations, after which, through cross orders they dragged them down to, on an average, about ten per cent. In the downward, sickening movement the pool must have gained stock, notwithstanding the big bull points put out by, so says report, the Levy-Harmon consolidation. It is needless to say that the latter is a bull on Savage and Hale and Norcross, but why it is desirable to sell \$75 and \$20 (the price many have the two stocks to go to) stocks at less than \$3 a share, is beyond the writer's knowledge. Who knows but the suits against the two mines have considerable to do with the desire to sell? It looks very much like it, for the management of the Savage mining company appears to be fighting to get all the time possible before letting the suit come to a trial, possibly in the meantime to unload their stock. The companies that give the most encouraging news from the mines are the Savage, Hale and Norcross and Con. Virginia. The first two have suits either against the company or else the officers, while the last-named mine is liable to have its right to the west workings contested at law at an early day. Notwithstanding the many drawbacks, the writer believes that an up move is near at hand, so as to make the shorts fill and sell, if possible, some stocks. Outside mining shares are still dull, although toward the close there was more doing in the Tuscaroras. For several weeks an accredited broker for the Tuscarora pool has been a quiet but steady buyer of the stocks at declining price.

After years of litigation, the Comstock (formerly Sutro) tunnel appears to be settled and now the development at depth of the various lodes in that district is in order. The extension through the Savage ground of the tunnel to the west should be inaugurated at an early day. This work would settle the west lode controversy.

In the case of M. W. Fox vs. O. C. Steel for an order restraining O. C. Steel and others from voting certain stocks of the West Con. Va. and California Mining Co., Judge Levy denied the order on the grounds that the plaintiff had a better remedy.

The hearing of the case of M. W. Fox vs. the Savage Mining Co. for an injunction to prevent the milling of ores by the Nevada Mill came up before Judge Hebbard on October 13th. Owing to the persistent, if not obtrusive objection made by the attorneys for the Savage Company, Judge Hebbard refused to hear the order, and thus the Savage Company get a few more days' time before the order to show cause will be assigned to some other department.

The suit against the Hale and Norcross management is set for trial on the 17th of next month.

Fears are expressed that both the Savage and Hale and Norcross Mining Companies will run through the Comstock tunnel, the high-grade ore known to be in the two mines, and call it waste rock. The idea of Levy-Harmon Consolidation doing anything like this, particularly if they are liable to be caught.

In Belle Isle, Tuscarora District, on the 450 level, they have penetrated the downward continuation of the high-grade ore found on the 350 level. This is considered very important. In Navajo and two other of the mines, important work is being done. From the Bodie district, our advices indicate that the mill will start up soon on Bulwer ore. In Bodie, important developing and prospecting work is being pushed ahead. Probably after the assessment is delinquent, it will be made public. In Mono, considerable secret work is reported; but how true this report is, we are unable to learn.

From the Comstock mines our advices report an improvement in Con. Virginia on the 1800 level. That the management can run into good to high-grade ore at any time desired is an open secret among mining men, yet it looks as if it is the intention before closing to develop the various levels extending from the 800 (on this level very high grade ore was found far to the west) down to the 1800-foot level. The work in Ophir, Mexican and Sierra Nevada is being closely watched by mining men. Developing and prospecting work is still under way in Best and Belcher, Savage, Hale and Norcross, Potosi, Con. Imperial, Challenge, Confidence, Belcher and Kentuck. From Yellow Jacket and Crown Point reliable advices of the work which it is said is being done is hard to get. The water in the Gold Hill mines is being steadily lowered by only one pump; the other is held in readiness for work if the one now in use gets out of order. Active work ought soon to be commenced in these mines below the water level. There is good to high-grade ore on several levels in these mines, but whether the public will get the benefit from its milling, or get the usual assessments, remains to be seen.

Mining shares opened this (Thursday) morning at lower prices under better business. After the regular call they rallied some, but closed weak under strong bear points and a general belief of still lower prices soon. There is a growing impression that a big quarrel is brewing on the Comstock between the managers of the Gold Hill mines and those of the Middle and North End mines. It is claimed that the Comstock Tunnel Co. movement is the first entering wedge in the rumpus.

MECHANICAL PROGRESS.

Mechanical Evolution.

The term evolution is nowadays employed to denote a slow, progressive unfolding, or growth and describes in a very complete way the history of all important machines and processes in industrial development. This evolution is not an ideal matter; on the contrary, it is a business one, that must be taken into account the same as taxes or an expense account. Every improvement of any importance comes down to a standard of "common practice," through a course of evolution.

At the present time we are busy with steam expansion; doubles, triple and quadruple engines, with high boiler pressure. If one looks back for half a century, the evolution of this matter assumes a tolerably regular sequence, not so much of discovery as adaptation. It is a quarter of a century since Perkins began his experiments with high-pressure steam. Wolf, much farther back, introduced the second cylinder. Sixty years ago regular compound engines were made and fitted into steamers in Holland. The drawings of these engines have recently been reproduced in England and published in the *Engineer*.

On the Ohio river 40 years ago there were compound engines. The Hawkeye, that was sunk about 1848, by her fly-wheel breaking, had compound engines. The Clippers, No. 1 and No. 2, lasting from 1846 to 1856, had compound engines, set tandem, so had the Memphis, a New Orleans and Cincinnati packet, 35 years ago. Her engines were about 16 and 24-inch bore, the cylinders set tandem. They were called then Clipper engines, from the name of the first boat fitted up in this manner on western waters, and were in all essential respects the same as compound engines are now made. The pressure employed was nominally 150 pounds per inch, when the "chief" did not hang too much weight on the safety-valve. In that case the pressure was uncertain, and rose rapidly if an opposition boat was seen ahead.

It is more than 15 years since John Elder of Glasgow was in the heat of battle with his competitors over the compound engine problem, and it is ten years or more since Mr. Galloway of Manchester, England, constructed a quadruple expanding engine for a cotton mill there, and was laughed at for committing such a vagary. The rule of "evolution" in such things is inexorable. There is no escape from it except on the principle of "proceeding in haste and repenting at leisure."

Mr. A. S. Hallidie's first cable railway in San Francisco was constructed in 1873, 17 years ago. Since then there has been concentrated on this subject the best efforts of our ablest engineers, spurred on by the incentive of a great public want and ample facilities. Now, at the end of this time, we find ourselves changing, modifying and improving with scarcely one feature or detail settled in any definite way. A new type of cars is just being tried, a new system of turn-tables has been adopted, the traction gearing is widely varied, the cable conduits are taking various forms, and little of the old appliances remain. We can see many years more of evolution before the cable system of propulsion assumes what is called standard practice.—*Industrial World*.

Chemical Principles in Boilers.

In the manufacture of boilers, according to a recent writer, the observance of certain chemical principles in respect to the metal employed is an essential consideration. Thus, a metal with high conductive properties should be preferred to one possessing it in a lesser degree; the thickness of the sheet should not be excessive; the polish of the exterior surface should be very slight, and, if it is desired to prevent the heat from radiating from the surface of the boiler or steam cylinder, they should be covered with some poor conductor, like wood charcoal, earthy matter, felt, etc., and then by some high reflector like polished iron, copper or brass. It is known that, when the heat-rays from any source of heat—strike a body, one of three things may follow, either they penetrate into the mass, and are absorbed, or they pass through it, or they are stopped at the surface without penetrating, and are either reflected back in the direction whence they came, or, by making the angle of incidence equal to the angle of reflection, pass off in an oblique direction. Polished surfaces and those with a clean color are usually the ones that reflect heat with the least amount of absorption, and of these, mercury stands in the front rank, and brass comes next, while tin, steel and lead are the reflectors, having only three-quarters the efficiency of brass. White reflects, while dark and dull colors absorb heat, as do also wood and earthy substances. These properties, whether radiating, absorbing or reflecting, have therefore, important practical relations to the choice of iron for boilers.

EARLY HISTORY OF IRON MAKING.—A late number of the *Scientific Monthly* contains the first of a series of articles upon the above subject which will, no doubt, be of much interest in bringing many facts before the intellectual class of readers, such as will be likely to widen the general field of intelligence, and pave the way, among scientific men, for enlarged views of the iron business, and in so doing promote

valuable improvements in its manipulation. The history of crude iron in the United States says a cotemporary is in itself an interesting study; but taken in connection with the enormous present consumption of the products of iron and steel, and their universal adoption in the great enterprises of the world, it reads like a fairy tale squalling if not surpassing the fables of Arabian dreamers, in point of wealth and the surprising effects evolved. The study of iron and steel manufactures leads directly to that of the wonderful invention and skill displayed in the machinery and appliances necessary for the evolution of the one into its most costly, finished products, and it is in this department that one meets with the greatest results of mechanical perfection. The more the subject is investigated the more importance it assumes. The fact is patent that the general public knows too little of these things, and turns from them on account of the technicalities which surround them. What is needed is the introduction of plain accounts of the origin, history and operations connected with these branches of industry into common schools and colleges, into the homes of practical mechanics, into manual training schools, into every shop and furnace where one becomes iron, iron turns to steel, and steel into buildings, ships, bridges, viaducts and all the great engineering works of the day. The phrase of "Iron is King" is no senseless electioneering cry—it is a truth.

MALLEABLE IRON.—Malleable iron castings are made in dry or green sand molds that do not differ materially from ordinary cast-iron moulding. The iron is poured very hot and the product is a shiny, gray, highly brittle casting, these characteristics being principally due to the selection of pig iron. The castings are then taken and put into square boxes, where they are embedded in oxide of iron, mostly in the form of iron scale purchased from rolling mills. The boxes are put into furnaces and gradually raised to a high temperature, the limit being only short of the melting temperature of the iron under treatment. The higher the temperature maintained, the better the product. The boxes are kept in the furnace seven or eight days and then allowed to cool slowly. As soon as the castings can be handled, they are ready for cleaning. There is considerable difference of opinion among metallurgists as to the rationale of the process. The prevailing opinion is that the decarbonizing material, when kept at a high temperature, removes from the part of the iron penetrated the carbon, sulphur, silicon and manganese by a process of oxidation. An eminent chemist, however, who has given the subject profound study, attributes the change in the physical properties of the castings after treatment to the separation of amorphous graphite within the metal, without which separation he holds that the castings will remain brittle when the amount of carbon is decreased to the usual extent. By this as it may, the practice of cementation with oxide of iron on the proper castings produces a very tough casting that is filling a highly important place in American industries.

THE VOLATILITY OF IRON.—Herr Fleitmann's experiments in soldering iron with nickel have yielded some important results with regard to the volatility and atomic penetration of the former metal. The adhesion of the two metals was so intense that it became impossible to separate them by mechanical action, and chemical analysis proved a perfect assimilation, although the soldering had been effected at a temperature of from 500° to 600° below the fusing point. Other tests established the volatility of iron when heated to cherry redness. Two plates of iron and nickel, superposed, were submitted to the same degree of heat; the iron passed into the nickel to a notable extent without soldering or adhesion of the surfaces resulting. On the whole surface of the sheet of nickel an alloy was formed with the iron, which, in the case of one millimeter sheets, penetrated to 0.05 of their thickness, and contained on the average 24 per cent of that metal, the proportion being naturally stronger on the surface. An important fact is that the passage of the iron to the nickel is not reciprocal. While the combination disclosed itself on the surface of the nickel plate by the argentiferous luster of an alloy of iron with 50 per cent of nickel, the iron plate remained intact, and preserved the somber appearance which it had received from the scaling. The volatility of iron in this instance still awaits an explanation, and it is not known if it is to be attributed to traces of cyanide, chloride or carbide of iron. In any case, the exceptional welding properties which iron possesses in comparison with other metals must depend on a partial volatilization at a temperature much below the fusing point.

A COMPARATIVELY NEW MACHINE for use among the shoe manufacturers is the automatic change stitch. It is a one or two needle machine, and is designed for closing seams, making lining, tape staying and putting on tips. It is said to be of a simple and economical nature, and thus far has been operated most satisfactorily.

A MIGHTY SYSTEM.—The Santa Fe system of railroads, as it exists at present, is one of the grandest railway combinations on the continent. The total mileage of railroad now owned and controlled by the company is 6444, and to these figures must be added the railroads controlled jointly with other companies, making the aggregate 7704 miles.

SCIENTIFIC PROGRESS.

The Blue of the Sky.

Every one admires and talks of the blue of the sky, and every one has noticed that it is of a deeper and richer blue at one time than at another; but who can give the cause of this constantly recurring change?

In seeking for this cause, M. Crover has reported to the Paris Academy of Sciences the result of his systematic observations of sky color from December, 1889, to December, 1890.

He finds that the sky is most intensely blue in December, January, March and September, and paler in July, August and November. Observing the changes from hour to hour, he found that it was more deeply blue in the morning than during the heat of midday. This indicates that, since the deepest color is seen, generally speaking, in the coldest months and during the cooler part of the day, heat is an important element in determining the depth of the sky color.

This recalls one of the most brilliant of the many experiments with which Professor Tyndall used to illustrate his lectures. By projecting a beam of electric light into a cloud of invisible particles of vapor in a glass vessel he was able to imitate the finest azure tints of an Italian sky.

The point of the experiment was to show that the sky tint is caused by the reflection of the blue waves of light from minute particles floating high in the air. The waves of blue light are shorter than those of yellow or red, and consequently are more easily arrested and reflected back.

When the sun is blazing hot high in the heavens it dissolves the fine particle of vapor to a great extent, and leaves fewer of them to split up the scattered daylight and send its blue beams back to the observer's eyes.

It will be easy and interesting for any person to observe for himself the variations in the color of the sky. Perhaps new facts may thus be discovered that men of science will be glad to learn.—*Garrett P. Serviss*.

SCIENTIFIC CRANKS.—The world is much indebted to what are sometimes called "scientific cranks" for many of its comforts and conveniences. Every time we strike a match, says the *Aluminum Age*, we are indebted to the men who have studied science for the mere love of it. The men that worked away at coal tar "just to see what was in it" made the whole world their debtors by discovering alizarin, the coloring principle of madder, and to these men the world is indebted also for aniline, antipyrine, and more than 100 other coal-tar products. Scientists, wondering what was in crude petroleum, found paraffine and vaseline. Pasteur wondered what caused fermentation. He found out and brought a new era to wine-making. The singing and dancing of a teakettle attracted the attention of a brain, and we have as a consequence all the applications of steam. The swinging of a chandelier in an Italian cathedral before the eyes of young Galileo was the beginning of a train of thought that resulted in the invention of the pendulum, and through it to the perfecting of the measurement of time, and thus its application and use in navigation, astronomical observations, and in a thousand ways we now pass by unnoted, has been of such practical value that the debt to scientific thought, even in this one instance, can never be known. Science, in its study of abstract truth, is ever giving to man new beginnings. While the devil is engaged in finding mischief for idle hands to do, science is eternally at work finding something useful for them to do.

CURIOUS RAILWAY MAGNETISM.—*La Nature* notes the following curious and interesting phenomena: Two railways, one the Sceaux line and the other the Ceinture, pass within a comparatively short distance of the Montsouris Observatory, Paris, the former line being about 80 meters distant and the latter but some 60 meters. During the passage of trains on the Ceinture line, which is nearest to the observatory, the bifilar magnet is found to be disturbed and its oscillations are registered photographically; indeed, the movements are so regular that the curve clearly indicates the exact time of each train passing the observatory. This phenomenon is due to the fact that, as the line crosses the direction of the magnetic meridian, the wheel tires of the carriages become magnetized by induction, and so produce, in consequence of the laws of magnetism, a deviation of the bifilar magnet. The trains on the Sceaux line give rise to a phenomenon not less curious. Whenever the engine driver blows off steam, the electrometer is partly discharged, the electrical potential of the air falling to about one-half its original value. These disturbances are brought forward by the Director of the Paris Observatory in order to oppose the scheme which is now proposed of extending the railway from Sceaux to the Place de Medicis.

THE LABRADOR SCIENTIFIC EXPEDITION.—Early last spring, Bowdoin College sent out a scientific expedition to explore the almost unknown interior region of Labrador, under Prof. Lee as chief. This expedition has met with most satisfactory results. It has fully solved the question of the existence and grandeur of the Grand Falls of Labrador, a subject which had hereto-

fore been a legend to the scientific world. This waterfall is higher than Niagara, and replete with grandeur. The fall proper is only 200 feet high, but the short rapids above this increase the total altitude to 500 feet. It is the first scientific expedition made to these falls, and the full report is looked for with interest. A race of Mont Agnais Indians has also been found—the first discovery of that race known to a white man.

Civilizing Influence of Railroads.

The beneficial influence of the railroad is not confined to commercial benefits alone; it affects as well the civil, moral and intellectual relationship of communities wherever it goes, whether of small or large areas. It reaches out even to international relationships, and is already manifesting most important influence on the general character as well as commercial interests of nations. Wherever the railroad appears, isolation, and all the prejudices which such condition engender, as in China, is rapidly finding its way into the ash pit of history. Japan has been quite disenthralled from its sleep of centuries. China is already feeling the life-giving influences of this great modern civilizer, and is just now in the throes of a moral and industrial revolution. It is true, as recently remarked by a cotemporary, that nations now are neighbors, and notwithstanding all political jingoism to the contrary, it is becoming an economic and historic fact that as we shorten distances and develop commerce, we reduce the possibilities of misunderstanding and rupture. In this kind of evangelization the railroad has been one of the most vital and important factors. It has done much and is destined to do more. The steel rail will yet be a planetary institution. It is annexing the globe, and when complete, will radiate from the equator to the poles. It is just 24,000 miles round the waist of Mother Earth, and when the Bessmer girdle is complete, some 20,000 miles can he traveled in a palace car. From New York and other Eastern points we can travel to San Francisco, thence to Alaska, can cross what will be but an ocean ferry to Siberia, and on to China and India. The gorges of Afghanistan will pass in panoramic grandeur before the traveler as he glides along to Russia in Europe; Berlin, Paris and London will be scheduled in the same time table, and an Atlantic trip of five days will see the cosmopolitan American in sight of the Hudson. It is simply a question of time, and in less than two decades will probably be an historic fact. The Siberian railway is being pushed with vigor, and the American link, missing in Alaska, will, without a doubt, be supplied in a few years, and the railway map of the planet be complete.

TWO CHARACTERISTICS mark the age. One is a restless curiosity to study the hidden pathways of being, to illuminate darkness, penetrate mysteries. It is the age of microscope, telescope and spectroscopic. The eager quest of the scientific spirit is seen in natural history, physiology, literature and religious and political history. Tradition can set no limits to the pursuit of truth, and no one now dares to brand this earnest curiosity as irreverence or infidelity. But another spirit is equally manifest. It is the frank confession of the limitations of human knowledge, the impossibility of clearing up the mysteries which lie beyond the domain of our knowledge. There is an agnosticism in philosophy and theology which stands out in strong contrast to the theological dogmatism which had mapped and published the whole plan of the universe. Of the two, agnosticism is more modest and cautious. Both of these characteristics, the earnest search for truth and the patient acknowledgment of human limitations, are necessary; but, for the pursuit of truth, faith is necessary to impel our curiosity, and hope is necessary to turn our doubt and ignorance into trust and expectation. Agnosticism as an intellectual trait, may be but one aspect of modesty and candor; but as an emotional trait, it is negative and hesitant, and needs to be reinforced by the sentiments of hope and faith.

THE PRODUCTION OF POLLEN.—The immense number of pollen grains produced by a single flower apparently militates against the saying that Nature allows nothing to be formed but what is needful. It seems, indeed, a vast waste of material to have such a multitude of grains when so very few would answer the same purpose. In a single flower of the peony there are about three and a half million grains. A flower of the dandelion is estimated to produce nearly two hundred and fifty thousand. The number of ovules in a flower of the Chinese wistaria has been counted and the number of pollen grains estimated, and it is found that for each ovule there are seven thousand grains. While few fall below the thousands, many rise far above the peony in point of numbers. These are the wind-fertilized flowers, and here Nature must provide for an immense loss of material.

CHEMISTRY is to a large extent an empirical science, and the chance experiment may lead to greater results than could with our present data be derived from the closest study or the keenest reasoning. The most important chemical discoveries from the first manufacture of glass to the whitening and refining of sugar have mostly been due to some happy chance which might have befallen a mere dabbler as easy as a deep student.

ELECTRICITY.

An Electric Road from Napa to Calistoga.

Under the above head-line the Napa Journal of a late date publishes the following information, which it is to be hoped is reliable: "It is rumored that steps will soon be taken by several prominent citizens of this county, assisted by San Francisco capitalists, to construct an electric railroad from tide water at Napa to Calistoga, a distance of 28 miles. Early in October a committee appointed for that purpose will wait on an electrical construction company in San Francisco, and will receive and ascertain estimates as to cost, etc. It is proposed to construct the road early in the spring. Cars will be used for freight as well as for passengers. When the road is completed it is proposed to start cars every hour to Calistoga, from which place also cars will leave every hour. The rate of fare at first will be about one cent per mile per passenger. The cars will carry light freight and produce at a great reduction from the price now charged on the railroad." A method of travel affording frequent trips either way is the only thing wanting to make Napa Valley one of the most desirable localities for homes of the wealthy.

THE PHILOSOPHY OF ELECTRIC WELDING.

According to Professor Elihu Thompson, it is not the extra resistance at the break that gives rise to the heating in electric welding. The imperfect contact there, no doubt, hastens the heating at the joint, but a solid bar placed between the clamps of an electric welding machine can also be raised to the welding temperature. The real cause of the concentration of the heating between the clamps is the relatively greater conductivity of other portions of the welding circuit, which is usually composed of massive copper conductors, kept cool in the case of large work by the circulation of water. By keeping the conductors cool in this way, their resistance is maintained constant, and an accumulation of heating effect follows at the joint where the rise in temperature increases the resistance. In large works, it has been found that hydraulic power can be advantageously employed both for clamping and making contact with the pieces to be welded or worked. In dealing with metals such as lead, tin, zinc, the temperature required for welding is so low that the metal never glows, and the progress of the breaking cannot be watched with the eye. By properly shaping their ends, leaden water pipes can easily be welded together end to end. The meeting edges should be thinned so as to reduce the surface of contact below the area of the pipe wall. Joints thus made are very good and sound. Most metals can be welded without the use of a flux, but for good work a flux is often desirable.—London Iron.

NEW ELECTRIC MINING APPLIANCES.—An Eastern contemporary, in referring to Edison's new mining appliances on exhibition at the Montreal Electrical Exposition, says: Great interest has been manifested here in the new Edison electric mining appliances exhibited at the Electrical Exposition. The most striking of these is the electric percussion drill, which will bore at the rate of three inches per minute in the hardest granite. It requires but little power to operate, and can be worked any distance from the dynamo to a limit of three miles. The drill is very simple in construction, having no moving parts except the plunger, and nothing that will be affected by moisture. The device, it is said by experts, will completely revolutionize mining work. The next in importance is the diamond prospecting core drill, designed for locating mineral deposits. It will bore 150 feet to the earth, bringing out a specimen of the mineral for the purpose of determining its value. Some have likened this drill to the mythical "divining rod," which was supposed to indicate the location of minerals. The Edison drill certainly resembles such an invaluable instrument. Aside from these are exhibited electric coal drills, electric hoists, electric fans and electric pumps, showing that Edison has turned his attention in earnest to mining work, and many are expecting marvelous results from this branch of electricity in the near future.

ELECTRIC LAUNCHES ON THE THAMES.—The number of electric launches on the river Thames, near London, is constantly increasing. They will soon equal the number of boats using steam on that river. The most of these boats are using stowage batteries, and so great has become the demand in that direction, that to meet the requirements, a floating charging station has been built. In appearance it is very similar to a house boat. The charging station consists of a river barge, 80 feet long and 14 feet beam. The machinery is placed in a compartment at one end, and consists of a semi-portable steam engine plant and dynamo of efficient output to charge the accumulators on six launches simultaneously. The remaining portion of the boat contains a store room, an office, sleeping apartments for the attendants, and an engineer's room, where a lath is fixed, and attendants are kept constantly in readiness to effect any repairs to launches which may be required, or convenience boat owners know how to appreciate.

LONG-DISTANCE POWER TRANSMISSION.—The comparison of efficiencies of various methods of

transmitting power to a distance has long since demonstrated the superiority of electricity for the majority of cases occurring in practice, and involving the utilization of natural forces. But far more than any other method, the electric method permits of a wide range of conditions of working, and to select those which will result in the most economical operation has by no means always been an easy task in the past. In an elaborate discussion of this subject, Mr. H. Ward Leonard, in this issue, shows the relation to one another of the various factors which enter into the solution of a problem of this nature, and the results obtained by him, as exhibited in the charts, will, we are certain, be welcomed by every one interested in electric power transmission. Much of the discussion on this subject has been confined merely to a consideration of the cost of conductors. While this item is, no doubt, a large factor in the equation for economy, it is not by any means the only one, and it is therefore desirable, as pointed out by Mr. Leonard, to have a handy means of comparing all the factors without elaborate calculations.—*Electrical Engineer.*

ELECTRICITY FOR MINING PURPOSES.—No body knows better than mining engineers the difficulty of transmitting power from the pit's mouth to machinery at the bottom of the shaft. Steam is largely used, but this limit is soon reached at which it can be economically transmitted. The loss by evaporation is enormous, and as fires cannot be permitted in the mine, steam power, owing to the distances at which the hoilers have to be placed, is often out of the question. The best substitute hitherto has been compressed air. Numerous compressors are erected and work on the surface, and the air is forced down pipes to the positions required for use. It is found by practice not more than 30 or 40 per cent efficiency is obtained in its use. The cost of running strong pipes from the surface to distant parts of the mine is something enormous, but for want of a better system of power of transmission it has had to be done. Mine owners everywhere are watching most carefully the results of electric plants in connection with mining operations, and if they once learn the future to answer the purposes as well as they have done thus far, electrical engineers and constructors will soon have an enormous addition to their orders.

GIANTIC ELECTRIC RAILWAY SCHEME.

From time to time rumors of immense, improbable and sometimes impossible schemes reach us from the United States, and it would seem that the continent is now about to tread in the same path, and that Brother Jonathan is not to have all his own way in the matter of startling enterprises, notwithstanding the novelty that he already possesses in the railroad on pine tree tops, which forms a prominent feature of the landscape in a certain part of Sonoma county, California. The project is being seriously discussed in Naples of building an electric railway in that city 100 metres (nearly 350 feet) above the level of the streets. Veritable towers, higher than the first platform of the Eiffel structure, would support the rails; passengers would ascend by elevators; while the motive power it is proposed to utilize a fall of the Sereno. Although this would be the highest and most unique railway of its kind in the world, we are unable to understand the object of the projectors, nor do we think that the capital would be forthcoming for a scheme which in all probability would prove unremunerative.—*London Iron.*

WIRE ROPE VS. ELECTRIC TRANSMISSION.

In the third revised edition of *Electric Transmission of Energy*, the author, Gishert Kapp, a leading English electrician, inventor and writer, makes the following statement regarding the relative merits of wire rope and electric transmission: "It pays to transmit cheap water power by wire rope if the distance is less than a mile, and electrically if the distance is a mile or more. This applies to all powers. It pays to transmit cheap steam power if the amount of energy required at the receiving station does not exceed ten-horse power. If the distance is less than a mile use wire-rope transmission, for distance of one and upward to two or three miles use electric transmission. Beyond this limit a small local steam or gas engine is preferable."

SPEED OF ELECTRIC SUBMARINE CURRENTS.

Recent experiments made at McGill College, Montreal, under the auspices of the British and Canadian Governments, to ascertain the longitude of Montreal by direct observations from Greenwich, have led to the determination of the length of time a telegraphic signal takes to cross the Atlantic. Out of 200 signals sent, it was found that the average time taken to cross the Atlantic and back again—about 7000 miles—was a trifle over one second.

AMERICAN ELECTRIC ENGINEERS IN SPAIN.

Mr. Morton Edward Eden of the Brush Electric Co., Cleveland, O., has been called to Europe to superintend some heavy electric railway construction in Spain, to be put in by an English concern.

RESPIRATION OF PLANTS.

While plants are taking in carbon and throwing out oxygen, they are at the same time, though only to a slight extent, doing exactly the reverse, taking in oxygen and throwing out carbonic acid. This is very similar to the act of breathing in animals.

GOOD HEALTH.

The Sour Stomach Remedy.

Our readers will recollect the article published in our issue of Sept. 12th, on the plant *Leuconthemum*, as a substitute for bicarbonate of soda, for sour stomach, water brash and heart burn. The publication of that article has brought the following response, containing much further valuable information in regard to the malady referred to, and also illustrating the value of the Press as an advertising medium.

Boston, Mass., Sept. 22, '91.

GENTLEMEN:—The article on "Sour Stomach," came duly to hand, and the results are on me in a postal shower.

The day after I received a copy of Press with my article in print, I had five letters in the first mail, from all over the country; one from Brooklyn, N. Y.; one from Minneapolis, Minn.; one from Denver, Colo.; and two from California. The next day there were four in the morning's mail, and one in the last mail that was Saturday. Monday brought five in morning's mail, and in the evening's mail five. The evening's mail gets here at 4:30 and the morning's by 8:20. The orders are filled and mailed in the morning by 10:30, and in the evening before supper, at six o'clock. I send herewith a copy of my Health Pamphlet, No. 9, (a flesh-brush circular) just as prepared by Dr. Cemmings and corrected by me.

Many Disturbances in the Digestive Tract Arise from a lack of soda in the blood—soda having been eliminated in removing carbonic acid from the blood, as an alkaline carbonate, its (CO₂) presence in the blood being due to skin inaction through contracted capillaries and these contractions arise from a need of more nerve force that is obtained by an increased flow of blood to the head through arterial tension, produced by the contracted capillaries of the skin.

The old method of taking soda as a carbonate or a bicarbonate is of little or no value, as in that form it is a neutral compound, as Nature forms it in the body—a waste product to be at once removed, and requiring nerve force to remove it.

How to Use Soda.

To be of service in the body, soda should be in combination with a freely digestible substance, either as we find it in Nature, combined with albumen in work or as prepared with citric acid or malic acid. I prefer the former, and prepare it thus: To the expressed juice of a good-sized lemon, in a large tumbler, I add an even teaspoonful of the ordinary cooking soda (bicarbonate of soda), and stir till the effervescence subsides (that the tumbler is now full of an irrefragable gas can be seen by dipping a lighted match into the tumbler, when it will be extinguished by the carbonic acid present in the form of a gas); then pour off the gas, and if the juice is now a mild acid or nearly neutral, fill up with hot water (otherwise add more soda before the water). If, after filling with water, there should be an alkaline taste, more lemon juice could be added, till you have a pleasant emollient drink that will refresh the body and nourish it too. Soda is the most important of all the elements of the body, as it is always associated with albumen in work, in serum, blood corpuscles, lubricating fluids of joints, fascia, tendons, arterial and venous walls. In arthritis, the lime is carbonated; in atrophy of muscles, potassa is carbonated, and all from a retention of carbonic acid at the skin. You see the far-reaching effect of skin inaction in the withdrawal of important elements of the physiological work of the body.

But these ill effects are not so readily seen or felt as are those that arise from arterial tension; the list of troubles run through anæmia, apoplexy, arteria, asthma, etc., to the end of the alphabet, and it is always the weakest part that suffers, as it is in a community the poorest devil goes to the wall.

There is no need of Sir Morrill Mackenzie's theory of "poisoned nerves," as set forth in Good Health column, Press, July 25, 1891, when each far-reaching result comes from a deprivation of vitality that closes the pores of the skin, contracts its capillaries and causes trouble generally.

Perhaps you wonder why I am writing. Well, I thought there would be at least 50 letters in this morning's mail, and there were none.

I had steam up and must write or burst. I have packed a few *Leuconthemum* plants, just to let you see how I send them, and so that the white dulse may be seen around your home if you want them. They will show what flowers whiten many fields here in the East. Yours truly,

Geo. F. Waters.

THE CORE OF CANCER.—Several of our interlopers, in referring to the articles which we have published from time to time on the cure of cancer in this city, have asked us for the name and address of the practitioner who cures this malady. The name has been repeatedly given in these columns, but we don't repeat it every time we make reference to the subject for the reason that these articles are not intended as advertisements for the doctor, but are written with the hope of calling attention to the matter as to secure for the same a proper medical investigation. The unwillingness of the medical faculty to accept

of any truth which does not come *ex cathedra* has thus far hindered our efforts in this direction, but we are still hopeful that the severe ethics of the profession will yield to constant calls of humanity for an investigation into a matter which promises to be of such vast benefit to suffering humanity everywhere. One of the latest of these requests which has come to hand is from the *Farm View*, published at Porterville, Tulare county, which says: "If there is any disease in which the specialist should be a blessing to the race, it ought to be in the case of cancer. If Mr. Ewer will give the name and address of the party who performs the cancer cures he speaks of, he will only be performing a public duty." The name of the specialist referred to is Dr. A. S. Cook, 224 Post St., San Francisco.—W. B. E.

ENGINEERING NOTES.

The Whaleback Steamer.

Another American Marine Triumph.

The "whaleback" steamer, so-called, which was recently built on the shore of Lake Superior, loaded with grain and sent to sea via the Lakes and St. Lawrence, arrived at Liverpool in 14½ days from Montreal, a most remarkable and unusually short passage. The steamer is called the Charles H. Wetmore, and is the first Lake-built steamer which ever crossed the Atlantic.

Several Clyde-built steamers have made the passage, but they have been so constructed as to be out in two and taken through the canals which pass around the rapids, in sections. The C. H. Wetmore was constructed in an altogether different manner. She was too large to be taken through the canals, and hence was obliged to "shoot the rapids," which she did, owing to her peculiar construction, with perfect ease and safety.

Several schooners have been built on the Lakes and taken through the canals, but they are too small for heavy traffic, and, moreover, totally unsuited to compete with steamers in any carrying trade.

Of course, such steamers as the C. H. Wetmore cannot make the return trip to the Lakes and it was not intended that she should. She will go from Liverpool to Puget sound on this coast, and enter upon the coal trade between the Sound and this city.

This style of steamer was considered doubtful in regard to her sea-going qualities, but her passage across the ocean has proven not only her practicability as a sea-going vessel, but also her superior qualities over most other sea-going steam craft.

This important marine achievement has attracted much attention on both sides of the Atlantic, and so well has she accomplished her purpose, that English agents of coal-bearing steel barges have expressed the opinion that the future steam collier, if not all cargo boats, will be built on the general lines of this craft.

Is it a New Monitor?

A contemporary, in alluding to this new American marine triumph, says: As has been stated by one connected with the building of the whaleback steamer, that the achievement of that vessel was not in having carried a cargo from Lake Superior to Liverpool, but in having demonstrated that in the heart of North America there can be built a steel vessel of safer construction, cheaper cost of operating, and greater proportionate carrying capacity than any other vessel in the world. Good marine authorities have pronounced the whaleback vessel the best all-round water carrier yet devised, and in the opinion of some it is the future war vessel!

While it may be rather early to predict certain success for this new marine construction, it is certain that from a ship yard on Lake Superior there have gone out four steel vessels that are a revolution to English shipbuilders. At one period in our history an American establishment in a few days produced a war vessel, the first appearance of which showed the nations of the Old World that they were entirely without naval defense. It may be that the victory of the Monitor in war will be paralleled by the new type of American ocean carrier in the more glorious achievements of peace.

A NEW BOAT PROPELLER.—This is a new and simple device patented by Mr. Charles E. Fox of Minneapolis, Minn. It is designed not only to propel a boat with great facility, but to afford the operator the very desirable advantage of going face foremost. The device is readily applicable to any row boat. The primary object is to run the boat by a screw propeller, the shaft of which passes through the stern of the boat through a packed hearing, the shaft being inclined slightly so that the propeller wheel is submerged. At a suitable point in the boat is a vertical yoke frame secured to the bottom of the boat, the frame carrying at its upper portion a double crank shaft provided with a central sprocket wheel. Below this is journaled a second shaft carrying a sprocket wheel and a bevel gear wheel, which engages a horizontal bevel that turns a short vertical shaft which is journaled in a step bearing below. This shaft, by bevel gear, causes the screw shaft to rotate. This arrangement is much more satisfactory in every respect, and will enable the boat to be propelled in very narrow channels, and the excursions will also be beneficial.

Proposals for Tunnels.—A. H. Koehing, San Bernardino.

See Advertising Columns.

Passing Events.

Several shocks of earthquake have been felt along the upper coast region of California this week, and while one of them was rather long-continued, it was not very violent, and no damage was done. The center of activity seems to have been between Napa and Petaluma.

A project is on foot to interest the general public in assisting the Lick Observatory, and will be brought before the Regents. It is proposed to organize a society of contributing members, who would be entitled to receive the bulletins and reports issued by the astronomers, as well as reproductions of the lunar and other celestial photographs being made. The observatory has not sufficient funds for publication of its reports.

It is thought the gap on the coast-line railroad between Elwood and Olivio will soon be closed. Some very extensive tunnels must be cut, and railroad officials are now inspecting the ground.

The librarians of the United States are in session in this city this week. The visitors are being received and entertained by the local librarians and citizens interested in library matters.

The big company at Cracker Creek, Oregon, is to resume operations and put in a larger reduction plant. The "cyanide process" is to be used. The closing down of the Eureka and

Excelsior Cons. Companies was a bad thing for Oregon's mining interest, and this starting up again is an important thing for the State.

Asphaltum and Bituminous Rock.

California leads all the States of the Union in the production of asphaltum and bituminous rock, and the industry is constantly growing. The various semi-solid bitumens, all known as asphaltum, comprise gilsonite, elaterite, uinitite, wurtzite, albertite, grahamite, asphaltum, maltha and hrea. These differ considerably from one another in their chemical composition, in their action with acids or other agents, and upon the application of heat, but asphaltum is the common term applied to the mass.

The bituminous rock is a sandstone impregnated with asphaltum and is very abundant in various counties in this State. Some 50,000 tons a year are now used, and new deposits are being opened, it having come prominently into the market as a competitor with other kinds of material for street paving.

A census bulletin by E. W. Parker gives the statistics of production of this material, and states that the capital invested in the business is now \$2,651,500, including land, machinery, tools, etc.

Although for a number of years asphaltum in its different forms was known to exist in California in large quantities, it was not until 1888 that its production assumed any important proportions as an industry. In that year, a large deposit of material containing a large percentage of asphaltum was found in Ventura county, and a company was organized in this city to develop and operate it. It contains about 24 per cent of "fixed bitumen," which increases its value beyond any material of like character found in this State.

In fact the material from this deposit is now being used not only in San Francisco, Oakland and other California cities, but in Seattle, Portland, Denver, Salt Lake, Chicago, Omaha and elsewhere. Another deposit nearly as good is found in Santa Barbara county. The material is heated and mixed with sand when it is used. Sand is mixed in the proportion of three to eight times the bulk of sand to one of the asphaltum. This method effects a considerable saving in transportation expenses. Once properly mixed and laid, it seems practically indestructible, as shown by many instances where it has been put in use and subjected to heavy traffic. There is no appreciable loss of time in placing it on the street as it soon "sets" and is ready for traffic.

This material is locally known as "Stradmant pavement," and large quantities are being mined and utilized for street pavements and sidewalks.

There are several deposits of bituminous rock in San Luis Obispo and Santa Cruz counties, in which the peculiar features of asphaltum formations are strikingly illustrated, clearly showing that they belong to no particular age or era; that they are found at various altitudes, and with no uniform character or appearance, hardness or chemical composition. Deposits of solid asphaltum and springs of viscid, oily material, commonly called "hrea," occur in places not a thousand feet apart, and yet in strata of unquestionably different periods of formation. A number of companies are now engaged in its production.

The bituminous rock of San Luis Obispo and Santa Cruz counties is a sandstone thoroughly impregnated with bitumen. It is used almost entirely for street paving, and for that purpose is probably more easily and cheaply prepared than any of the asphaltum products. The only treatment necessary is to steam it, so as to thoroughly mix its ingredients and soften it for spreading to a uniform thickness and a smooth, even surface. Bituminous rock has supplied a limited local demand for 10 or 15 years, but it is only during the past three years that it has assumed any commercial importance as an industry. Pavements made of this material 15 years ago and used under heavy travel have recently been removed and found to have lost very little either in weight or thickness; also that it stands equally well the high temperatures of the interior cities and the cold, damp atmosphere of the coast.

Until the remarkable impulse given to the asphaltum industry in California and Utah in 1888, the island of Trinidad and the deposits of Seyssel, France, and Val-de-Travers, Switzer-

land, furnished the bulk of the world's supply.

Although the production of bituminous rock in California, and of gilsonite in Utah have assumed proportions of commercial importance, with indications of much greater activity in the near future, the island of Trinidad continues to be the main source of supply for the United States. In the Eastern cities, Trinidad asphaltum is used for street paving to the almost entire exclusion of other kinds. This is due entirely to its advantage in cost of transportation. The railroad freight rates from the Pacific Coast practically shut out the bituminous rock of California from competition in the Eastern States, and a similar condition may be said to affect the sale of Trinidad asphaltum in the cities of Europe, since the bituminous limestones of Val-de-Travers and Seyssel, having the advantage in freights, control the markets. The cost of preparing the different varieties of asphaltum for street pavement is nearly the same, and as all appear to be about equally durable, the exclusive use of any of them is due merely to the advantage in freights.

Margin Trading to be Tested.

A few days ago Barrett & Co., stockbrokers, sold at auction in the San Francisco Stock Board rooms, a line of mining shares for account of a lady customer, Mrs. W. N. Wetmore. The firm rendered an account of the sales and also a statement of her account, neither of which she would accept, and now brings suit against Barrett & Co. for the sum of \$3380 for money paid. This suit is brought under a recent decision of the Supreme Court, declaring that under the Constitution of this State the dealing in stocks on a margin is not legal, and virtually declares that all moneys lost can be recovered from the broker or brokers who buy and sell on margin.

The lawyers on both sides of the case are said to be well up in this particular line of their chosen profession, and consequently the suit is attracting considerable attention, not only from mining share brokers and dealers, but also from bankers and others directly or indirectly interested in all classes of certificates.

It is to be hoped that points will be drawn out which will definitely settle the vexed question what margin trading is, and also, if it can be legally done, by substituting an agent for the principal without a written agreement signed by both parties and recorded as an evidence of good faith on the part of each. Aside from this consideration, it is held by a large class of persons that the transactions or dealing in mining shares or other securities can be made legal by the broker or brokers having the certificate or certificates put in the purchaser's name, and being in her or his name, and so recorded in the transfer book of the mining company, constitutes the person for whom the broker bought, the bona fide owner, and as such the latter can get an advance on the shares from the broker or any one else disposed to lend money on such security. This practice, if generally followed by brokers, would make dealing in mining shares legitimate and rob it even of the suspicion of being a species of gambling.

THE CHILI BAR SLATE QUARRY, El Dorado county, has been constantly developing for the last four years. A large force of men is engaged at work there. This company owns some 40 acres of land, which is like the majority of the land in the county where the slate industry is being carried on, as on every side rise steep hills of solid slate. The wall at the entrance of this quarry is now over 100 feet in height by 100 feet in width, this allowing ample room for work to be carried on. Slate has been shipped from this quarry to more than a dozen different counties in the State, and already the net proceeds from the sale of slate is \$25,000.

ELECTRIC LIGHT AND POWER.—The San Antonio Electric Light and Power Company has gone to work in good earnest to give the city cheap lights. They have commenced work in San Antonio canyon already to develop their water power, and by the 1st of January, or a little later, they expect to be ready to deliver light and power to order at Pomona, Ontario, San Bernardino and all towns in that valley for incandescent lights. They will only charge one cent per hour, and only for the hours the lights are actually used.

Comstock Mine Management.

EDITORS PRESS:—Can you inform me where and how the Gould and Curry Mining Co. has spent the assessments collected during the past year, amounting to \$120,000, and over?

For many months past, that portion of the superintendent's weekly report which you publish, has referred to work being done in the "grass roots," i. e., on the 200-foot level only, with two or three exceptions, when the 400-foot level was barely mentioned. Why have the lower levels been abandoned?

Does it denote good mine management and honesty of purpose for the management of this mine to spend \$120,000 on and above the 400-foot level, granting that they have explored the mine to any extent between the 200 and 400 foot levels?

The writer is glad to note the very just criticism which the managements of some of the Comstock mines are receiving from your paper. The course pursued by the managements of these mines to enrich themselves at the expense of the stockholders would not be permitted in any other business enterprise in this country, wheresoever located, and it is the province of the MINING AND SCIENTIFIC PRESS, and all other respectable newspapers to expose the corrupt methods employed by the several managements, and, if possible, to secure and furnish the evidence necessary to punish them. —A NEW YORK SUBSCRIBER AND STOCKHOLDER.

[In conforming to the wishes of our correspondent, a representative of this paper visited the Gould and Curry office, and found that only two assessments, of 30 cents per share each, were levied in 1890, aggregating \$64,800, and two of a like amount in this year. Regarding work in the mine, official weekly letters from the mines report that all work done is on the 200 to 400 levels. The only mention of work done on any other level is made in the annual report of the superintendent in November, 1890, wherein he states that on the 625-foot level, they had made connection with the Savage north drift, whereby they had secured good circulation of air for developing and prospecting work.

As our correspondent suggests, it does seem to be poor management for all work to be confined from year in to year out on three levels, particularly when it is a matter of record that the well-known superintendent "Jim" Ruhe received \$5000 about four years ago for discovering to the west, lower down, an ore body in the mine similar to the one he found in Con. Virginia, and over the division of profit from the same, he and Senator J. P. Jones had a lawsuit, which was compromised out of court. —EDS. PRESS.]

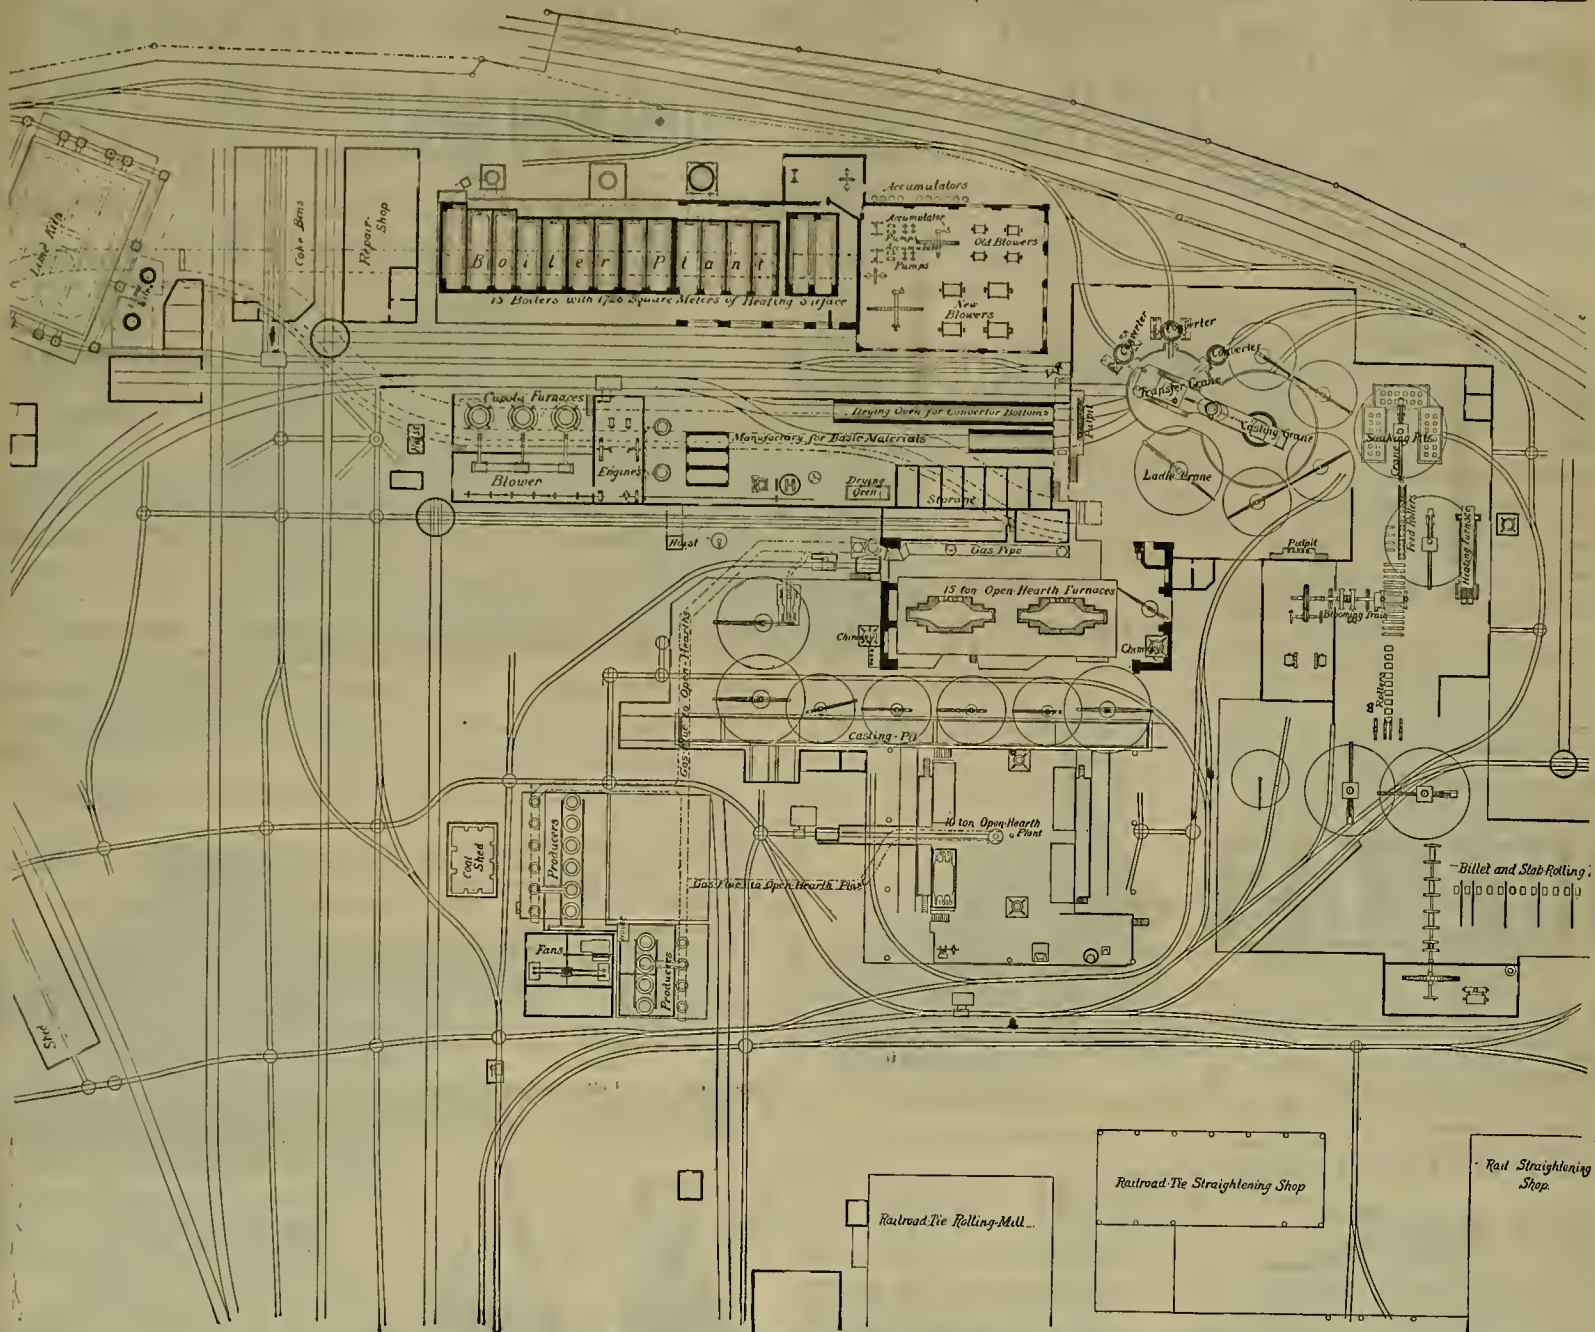

THE WORLD'S FAIR.—The California World's Fair Commission is still waiting the decision of the Supreme Court as to whether the State really appropriated any money at the last session of the Legislature. Until this is ascertained the California Commission can do little. They have, however, ordered the cutting of the three trees to be sent to the forestry building. The trunks are to be 20 inches in diameter and 25 feet long, and will be used as columns to support the colonnade. There will be a redwood from Santa Cruz, a sugar pine from Shasta and a sequoia from Tulare. The only expense will be in packing and transportation, leading millmen having volunteered to donate the trees.

A TRAFFIC ASSOCIATION.—The merchants of this city are organizing a traffic association, the object of which will be to secure better rates from railroad companies. Quite a general interest is manifested in the mercantile community and the association is expected to accomplish much good and enlarge our business field.

GOLD NUGGET.—A gold quartz nugget of the value of \$1,400 was found on Monday afternoon lying on the bedrock in the Washington mine at Iowa Hill, Placer county. It had lain there for a long time and many people had walked over it. Experts say this is one of the handsomest nuggets ever found in the State.

THE LICK OBSERVATORY, California, and the Prague Observatory, Austria, are now working together in lunar and stellar photography. The Lick has the largest photographic lens of any telescope, while the Vienna Observatory excels in enlarging and photogravure work.

DR. ELLIOTT CONES, who has for many years been one of the scientific workers in the Smithsonian Institution, is visiting the Pacific Coast to regain his health. He has been for some years at work on the Century dictionary.

GENERAL VIEW OF PHOENIX STEEL WORKS AT RUHRORT, RHENISH PRUSSIA.

Steel Works.

In last weeks PRESS engravings were given from Dr. Wedding's paper before the American Institute of Mining Engineers showing the Phoenix converter plant at Ruhrort, Rhenish Prussia; and this week we reproduce a drawing showing a general plan of the arrangement of these works. They were built in 1884. The necessity of filling in the ground of the whole plant to a depth of eight meters increased considerably the difficulty of providing proper foundations, and led to the design of the lightest possible iron construction for all buildings. Space is limited and hence the general arrangement which is shown in the engraving.

Direct metal from two blast-furnaces, producing 6000 metric tons a month, can be run to the converter-house by a locomotive. The same track also serves to bring in the remainder of the pig, which is melted in three cupola furnaces. At Phoenix, the Thomas pig carries 2 to 2.4 per cent phosphorus, 1.8 to 2.3 manganese, 0.2 silicon, 2.8 carbon and 0.02 to 0.07 sulphur.

The three converters are served by one central charging and transfer crane and by an independent casting-pit. The central crane takes the charging ladle from its truck and raises and swings it. Two men on the upper platform of the crane empty the ladle into the converter. The crane is then lowered, and the blow begins as the vessel is righted. The second arm of the same crane is ready to receive the casting-ladle. Ferro-manganese is thrown into the converter from the platform of the transfer crane. After a completed blow, when the casting-ladle has been picked up by the transfer crane, the latter swings into line with a casting

crane, which, in turn, takes the ladle and does the pouring, while the transfer crane is prepared to handle a new heat. The 1200-kilo ingots taken out of the moulds are charged into soaking-pits which are not specially fired. Thence they pass to the blooming-train, and, after that, are out up with heavy shears. The blooms are either sent to the billet or plate-mill, or go to other rolls for working up into a great variety of shapes.

The height of the three cupolas to the charging-door is 5.4 meters, the diameter at tuyeres is 1.4 meter, and that of the shaft 1.8 meter. The level of the hearth is 2.4 meters above the floor. Each cupola melts 35 metric tons per hour, with 700 to 800 millimeters of water-gauge blast-pressure. The two blast-furnaces deliver, in 12 hours, 80 to 90 metric tons of molten pig, which is blown without admixture of cupola-metal. The converter-charge is 11 tons, and the greatest record for 12 hours is 33 heats, or 315 tons.

The monthly output amounts to 12,800 tons. The duplex blowing-engine is fitted with expansion valve-gear, takes steam at 90 pounds, and delivers blast at 27 pounds. For the hydraulic machinery there are ten air-accumulators. The capacity of the mill amounts to 325 metric tons in 12 hours; 12,600 tons of blooms a month are rolled. The transfer and casting crane have each a central supporting column and two cylinders, one for the live and the other for the dead load. All motions, including the swing, are produced by hydraulic power, controlled by an operator on the crane. The same is true for all the soaking-pit and shear-crane, an operator being stationed on each. Piston valve-gear is used for all hydraulic valve-motions,

Green Oil in California.

Most of the mineral oil obtained in this State is what is denominated "black oil." The black oil of California is quite different from the green oil of the Eastern States, where, with a single exception at Lima, Ohio, which is quite different from California oil, no black oil has been discovered. Green oil, after distillation, leaves a light-colored residue well known as paraffine, which is of a soft, plastic consistency and of great value in the arts. Black oil, after all its volatile constituents have been thrown off, leaves a hard, black residuum popularly known here as "maltheine." The "asphaltum," which is so abundant in California, and which is now being largely used for street-paving, is simply "maltheine" largely mixed with impurities.

This new oil strike in Fresno may be considered one of much importance. It certainly will help it is followed up by other similar discoveries.

The Pacific Coast Oil Co. has for a long time had an oil at Newhall, Los Angeles county, called Pico crude, which is a green oil. It has been refined for the past ten years. When the oil field in Alma, Santa Cruz mountains, was being worked, they produced an oil known as an amber crude. These, so far as we are informed, are the only oils with a paraffine base known in this State, all the other oils having an asphaltum base.

The Fresno strike was made at a depth of 300 ft., and is reported to consist of a 10-barrel flow of pure green oil. It is worth on the market \$4 a barrel, while the common oil brings but about one-quarter that amount. In addition to that, this oil is capable of being refined,

while most other California oils cannot be refined to much profit. They are chiefly used as fuel and for making gas. Natural gas is also found near the well in such quantities that by capturing it as it issues from the fissures in the ground, the workmen are enabled to secure a sufficient quantity to run the machinery for operating the drills and pumps.

HUMBOLDT COUNTY COAL.—A dispatch from Eureka, Humboldt county, Cal., says: Analyses of the coal specimens found on Maple creek show a high proportion of carbon, the highest of any coal on the coast. Bituminous shale in the same locality gives nearly 50 per cent of volatile carbon. These facts have occasioned considerable excitement, and several tracts of land on Mad river have been leased and bonded during the last few days. Their development is progressing in several localities.

MINING LITIGATION.—The great mining suit of the Bell, one of the Chambers syndicate group of Anaconda mines, vs. the Speculator, has commenced at Helena Montana. The case involves over half a million dollars, and is for the ores extracted in the disputed ground. The Speculator people have been operating through a shaft, drifts and levels on an ore body which the Bell people claim is theirs and that it dips into the Speculator.

NO TOWER.—It is not thought probable now that there will be any tower at the World's Fair. The projectors of the most promising tower scheme abandoned it when they found that they would have to take down their tower when the exposition closed, because the Park Commissioners refused to grant any subsequent use of a site.

MINING ENGINEERING,**

Surveying, Architecture, Drawing and Assaying,
723 MARKET ST., SAN FRANCISCO, CAL.
Open All Year.

A. VAN DER NAELLEN, President.
Assaying of Ores, \$25; Bullion and Chlorination Assay,
\$25; Blowpipe Assay, \$10. Full course of assaying, \$50.
ESTABLISHED 1864. Send for circular.

MICHIGAN MINING SCHOOL.

A State School of Mining Engineering, located in the heart
of the Lake Superior mining region, giving practical instruction
in Drawing, Blue-printing, Mechanics, Mechanism,
Properties of Materials, Graphical Statics, Mechanical and
Electrical Engineering, Shop-practice, Analytical and Technical
Chemistry, Assaying, Ore-Dressing, Metallurgy, Plans,
Railroad, and Mine Surveying, Hydraulics, Mining, Mineralogy,
Petrography, General, Economic, and Field Geology,
etc. Has Summer Schools in Surveying, Shop-practice, and
Field Geology. Laboratories, Shops and Stamp Mill well
equipped. Tuition free. For Catalogues apply to the
Director, Houghton, Mich.

HEALD'S BUSINESS COLLEGE,

24 POST ST., S. F.

FOR SEVENTY-FIVE DOLLARS THIS
College instructs in Shorthand, Type Writing, Book-
keeping, Telegraphy, Penmanship, Drawing, all the
English branches, and everything pertaining to business
for six full months. We have sixteen teachers, and give
individual instruction to all our pupils. Our school has
its graduates in every part of the State. Our school has
its graduates in every part of the State.
Send for Circular.

E. P. HEALD, President.
C. S. HALEY, Secretary.

Giant Powder Fuse Cap Fastener.

The instrument represented in the above cut is a new and
and little invention, being designed to save life and limb,
and innumerable lawsuits, by doing away with the danger-
ous operation of digging out wet and unexploded loads
where Giant Powder is used in mining. The little instru-
ment crimps the cap on to the end of the fuse firmly and
absolutely water-tight. It is also used for crimping the
fuse. They are neatly gotten-up of the finest cast steel, nickel
plated. Price, \$2 each, or the entire instrument finished
in gold plate, \$5. N. W. MOODY, Fresno, Cal.

EVERETTE'S MINING OFFICE.

Pioneer Mining Office of the Northwest
Coast.

Having the largest permanent brick assay furnaces, chemi-
cal laboratory and mining office on the Northwest Coast
with a collection of about 4000 samples of the ores of Alaska,
British Columbia, Oregon and the Northwest Territories,
and having made personal examinations of nearly every
mining camp on the Pacific Slope, from California to
Alaska, I am prepared to do any class of legitimate and
honest mining work, such as EXAMINING, ENGINEER-
ING, SAMPLING AND REPORTING ON THE VALUE
OF ALL MINERAL, COAL AND FIRE-CLAY PRO-
PERTIES, BUILDING STONES, EARTHES, ASSAYS
AND ANALYSIS OF ORES, WATERS, CHEMICAL
SAMPLES OF ORE, PULP, "ORGANIC ANALYSIS"
WORK, and in fact any work connected with the office of a
first-class mining geologist and chemist. Any information
mining men may desire to know relative to the MINERAL
OR COAL RESOURCES of the entire Pacific Northwest
will be honestly given. Address Dr. WILLIE E. EVERETTE
Consulting Mining Geologist and Chemist, 1318 E Street,
Tacoma, Wash.

A. S. GRANT. S. B. CONNOR.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Oct. 15, 1891.

Business continues to enlarge, with the volume of goods going out increasing. The low prices ruling for coal, coke and iron are greatly in favor of iron workers, for it admits of their competing for work which usually goes to the Central and Eastern States. Money continues in liberal supply, and now that two of our leading banks, the California and Nevada, have had their annual meetings, they will be in better shape to accommodate their patrons and others. If last year's profits of these two institutions be accepted as a fair index of the profits and standing of the various banks in this city, then our banking institutions are in most excellent condition. Last year's profits of the bank of California aggregated \$584,776, and those of the Nevada Bank, \$347,000.

MEXICAN DOLLARS—The market hangs around 77 cts. The demand is fair, and the supply is large.

QUICKSILVER—Receipts the past week aggregate 127 flasks, and exports by sea, 646 flasks to Mexican ports. The market has strengthened under a good demand and stronger holding. Some sales are reported as high as \$45.

BORAX—Receipts the past week aggregate 282 cts. The market while strong is not quotable higher.

The borax bed near Ellensburg, Wasb., is said to be 18 feet deep and 50 per cent pure. A railroad is needed to develop this material. The road, however, when built from Port Eaton, will necessarily pass near the beds; 380 bbls. of borax were received the past week from Port Orford.

LEAD—The market shows a weaker tone, with buyers disposed to bid down. Cannery men are out of the market. At the East a stronger selling is reported.

TIN—The market is very dull and heavy, with concessions obtainable on a firm offer. The political campaign at the East has developed a full crop of, to call them mildly, exaggerators. It will be sometime before the true status of the industry in this country will be known.

LIME—Receipts the past week aggregate 2,223 bbls. The demand is only fair, but prices continued steady.

ANTIMONY—The market is strengthening in sympathy with higher values at the East.

SILVER—The market has held around 65 3/4 cts at New York, with certificates 1/2 to 3/4 cts higher than the metal. The strong bear influences heretofore reported are still paramount at the East and in Europe. To the persistent hammering of bears in silver certificates, the action of the two leading political parties and that of the New York Chamber of Commerce fortified by the gold-bug tendency of the Administration, is no doubt traceable the weak and unsatisfactory condition of the silver market to sellers. The State elections that are to be held, will have considerable bearing on silver. The advocates of free coinage claim over three-quarters of the members of the next house of Representatives and over one-half of the Senators. If Senator Sherman of Ohio should be retired from public life, no doubt it would be considered a free-coinage victory.

IRON—Imports the past week aggregate 300 tons of pig from Swansea. The market for both spot and near by arrivals, is in buyers' favor. The consumption is steadily enlarging. English advices report a fairly firm market. Eastern advices report buyers not disposed to go beyond this year's wants. The rail mills are being closely watched. When they enter the market as large buyers prices must appreciate.

COPPER—The market is easing off. It now looks as if the low prices looked for sometime ago, are to be realized soon. The stock abroad is slowly increasing. Iron Age reports the New York market as follows: "The market is somewhat unsettled at the present time. Reports to the effect that the Anaconda Co. will resume operations this month, seem to have slightly alarmed some sellers who were latterly strong on the 'bull' side, the downward movement in values in London is due partly to opening of Chili mines. In some quarters contracts covering several million pounds for delivery up to the first half of December were said to have been placed at 12.40c to 12.50c. There are faint indications that an interest representing a number of producers is not in harmony with jobbers or all consumers. Arizona ingot is in limited demand at the moment, but, with rather light supply on offer, prices are quite firmly held at 12c upward for prompt deliveries. In casting copper there has been very little movement and consumers hold aloof as much as possible pending the effect of the reported resumption of work at the Anaconda mines.

COAL—Imports the past week aggregate as follows: From Newcastle, N. S. W., 18,934 tons; Swansea, 3862; Glasgow, 2468; Hio, 1866; Sydney, 3368; Coos Bay, 600; Tacoma, 1900; Seattle, 3060; Nanaimo, 382; Liverpool, 2690; Departure Bay, 5190; total, 47,730 tons. Heavy arrivals the past week with several cargoes fully due cause spot coal to rule in buyers' favor. Colder weather the past few days has created a freer demand for house coals. Cheap coals is an assured fact for the coming winter.

COKE—Imports the past week aggregate 389 tons from Swansea. The market is essentially unchanged.

Eastern Metal Markets.

By Telegraph.

New York, October 15.—The following are the closing prices the past week:

	Silver	Silver in	Copper	Lead	Tin
Thursday	44 1/2	96 1/2	12 25	4 50	20 10
Friday	44 1/2	96 1/2	12 20	4 45	20 15
Saturday	44 1/2	97	12 20	4 45	20 15
Sunday	44 1/2	97	12 20	4 42 1/2	20 10
Monday	44 1/2	96 1/2	12 15	4 42 1/2	20 10
Tuesday	44 1/2	96 1/2	12 10	4 37 1/2	20 10

Quicksilver is firm at 60c. Borax is higher for carload parcels—concentrated, 84c, refined, 84c. Copper has been gradually sinking, as has lead. Pig tin holds its own.

Write Proper Names Plainly.

People who only occasionally write for the press fail to recognize the importance of writing proper names plainly. They are familiar with a man's name and write it hurriedly just as they would ordinary words. But when this manuscript is received by persons not familiar with the names they are often printed incorrectly, and the correspondent thinks the printer is stupid for making the mistake. Editors and printers are more than anxious to have things correct, and take a great deal of trouble to make them so. But with a hilly written proper name, there is nothing they can do except make the best they can of it. It worries them more than it does the man whose name is improperly spelled. All this could be avoided if correspondents would put themselves in the printers place for a moment. Look at the name after it is written, and consider if a stranger would be sure to make it out. In lists of newly elected officers sent us, there are sometimes several names written so that they could be "translated" in two or three ways. A little ordinary care would save much trouble and annoyance. We hope that our correspondents will bear this in mind when they are writing, and then we shall be able to print the names of people as they should be printed, without any mistakes.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department to, San Francisco:

METROPOLITAN DISPENSARY Co., Oct. 10. Object, manufacture and sale of drugs. Capital stock, \$100,000. Directors—W. L. McFarland, C. P. Thompson, E. B. Lee, H. Donaboe and B. F. Carver.

GOLDEN CROWN M. Co., Oct. 12. Capital stock, \$100,000. Directors—George Montgomery, John W. Pearson, J. F. O'Gorman, S. E. Yount and M. L. Templeton.

LAND & INVESTMENT Co., Oct. 14. Capital stock, \$1,000,000. Directors—W. E. Dean, A. K. P. Harmon, D. C. Bates, J. O. Whitney and G. H. Maxwell.

AIR COMPRESSORS.—An average shipment of four air compressors per week is the record of the Clayton Air Compressor Works of No. 43 Day St., New York, during the past two years. In addition to air compressors for use in mining, tunneling, etc., numbers have been sold for aerating crude petroleum for fuel, elevating acids and working pneumatic riveters. The Clayton air compressors are so well known and their reputation so long and well established that any extended description of them is superfluous, and we would simply say that several new and important improvements have been made, prominent among which is the patent combined governor, which regulates the speed of the compressor and the pressure of air at the same time and without attention from the engineer in charge. Any one requiring compressed air for any purpose would do well to write the makers for catalogue and information.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send this paper to any one who does not wish it, but if it is continued through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Assessment Notices.

CALIFORNIA AND ARIZONA MINING COMPANY. Location of principal place of business, 330 Pine Street, San Francisco, California. Location of works, Mohave County, Territory of Arizona.

Notice is hereby given that at a meeting of the Board of Directors held on the 23rd day of September, 1891, an assessment (No. 4) of Ten Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in U. S. gold coin to the Secretary, at the office of the Company, 330 Pine Street, San Francisco, California. Any stock on which this assessment shall remain unpaid on the 5th day of November, 1891, will be delinquent and will be advertised for sale at public auction, and no sale payment is made before, will be sold on MONDAY, the 30th day of November, 1891, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

T. E. JEWELL, Secretary.
Office, 330 Pine Street, San Francisco, California.

NEW-EL DORADO GOLD MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, Greenwood, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 23rd day of October, 1891, an assessment (No. 4) of Ten Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, No. 310 Pine Street, Rooms 15 and 17, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 5th day of November, 1891, will be delinquent and not advertised for sale at public auction, and unless payment is made before, will be sold on FRIDAY, the 27th day of November, 1891, to pay

PROPOSALS FOR TUNNELS

OFFICE OF THE CHIEF ENGINEER OF THE Arrowhead Reservoir Company, San Bernardino, California, October 10, 1891.

SEALED PROPOSALS

Will be received by the undersigned until noon of TUESDAY, the 15th of December, 1891, for the construction of three tunnels—one of about 300 feet in length, the second about 400 feet in length, and the third about 500 feet in length, through rock, in accordance with plans and specifications on file in this office.

Proposals must be accompanied by a certified check in the sum of \$2000, to be returned to the unsuccessful bidders. The Company reserves the right to reject any and all proposals. A. H. KOEHLER, Chief Engineer The Arrowhead Reservoir Co.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Concentrating Belt manufactured in San Francisco; we can therefore fill all orders on short notice. The length and width of these belts are the same as is used on the Frue or Triumph Concentrating Machines, but can be made of any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen. First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight rifles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

FRUE ORE CONCENTRATOR

OVER 3000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

Manufactured under Patents of April 27, 1880:
September 18, 1883; July 24, 1888;
and March 31, 1891.

Price of Plain Belt Frue Vanner, \$575, f. o. b.
Price of Improved Belt Frue Vanner, \$825, f. o. b.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Froes" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - \$650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)
Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grase Valley, Nevada Co., Cal. }
GRASE VALLEY, NEVADA CO., CAL., Nov. 10, 1886.
Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:
GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.
At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices.
(Signed) Sup't North Star and Original Empire Mining Co. DAVID McKAY, JR.,
N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 1300 IN USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

THE PELTON WATER WHEEL CO.
121-123 MAIN STREET, SAN FRANCISCO, CAL., U. S. A.

PELTON WATER MOTORS, Varying from the fraction of 1 up to 15 and 20-horse power, unequalled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. Address as above.

THE GATES ORE AND ROCK BREAKER.

UNLIMITED IN CAPACITY. UNEQUALED IN EFFICIENCY. UPWARD OF 3,000 NOW IN USE. Will do more than twice the work of any other with the same cost in wear. Gives a fineness of product that increases the capacity of any mill from 25 to 40 per cent without any additional expense. THE BEST AND ONLY CRUSHER ADAPTED TO MACADAM ROAD WORK. Send for Circular.

It having come to the notice of the undersigned that their patent rights are being infringed upon, intending purchasers are hereby warned that all such infringements will be duly prosecuted. (Signed) THE PELTON WATER WHEEL CO.

THE PELTON WATER WHEEL CO., 121-123 Main Street, San Francisco, General Western Agents.

IMPORTANT TO GOLD MINERS!

SILVER-PLATED AMALGAM PLATES for SAVING GOLD

In Quartz, Gravel and Placer Mining.

PRICES GREATLY REDUCED. ONLY REFINED SILVER AND BEST COPPER USED. OVER 3000 ORDERS FILLED. FIFTEEN MEDALS AWARDED. Old Mining Plates can be Replated. Old Plates Bought, or Gold Separated. These Plates can also be purchased of JOHN TAYLOR & CO., Corner First and Mission Streets, San Francisco.

SAN FRANCISCO GOLD, SILVER AND NICKEL PLATING WORKS,

E. G. DENNISTON, Proprietor.
653 & 655 MISSION ST., SAN FRANCISCO, CAL.
Our Plates have been used for 20 years. They have proved the best. We adhere strictly to contract in weight of Silver and Copper. SEND FOR CIRCULAR.

RECEIVED EVERY MEDAL Awarded on the Pacific Coast for Silver-Plated Amalgam Plates and Best Gold, Silver and Nickel Plating.

F. A. HUNTINGTON.

HERCULES GAS OR GASOLINE ENGINE FOR POWER OR PUMPING PURPOSES.

The Lowest Priced Reliable Gas Engine on the Market.

SEND FOR ILLUSTRATED CATALOGUE AND PRICE LIST.

For Simplicity it Beats the World. It has Fewer Parts, and is therefore Less Likely to get Out of Order than any other Gas Engine now built.

IT OILS ITSELF FROM A RESERVOIR. JUST LIGHT THE BURNER, TURN THE WHEEL, AND IT RUNS ALL DAY.

No Carburetor to get out of order. No Batteries or Electric Spark to care for. Always Ready, and a Boy can start it at once. No Double or False Explosions, which are frequent with the Unreliable Spark.

IT RUNS WITH A CHEAPER GRADE OF GASOLINE THAN ANY OTHER ENGINE, AND CONSEQUENTLY IT COSTS LESS TO RUN IT.

GOULD'S TRIPLEX ELECTRIC PUMP.

The Triplex Electric Pump.

The triplex or three-cylinder pump, made by the Gould Manufacturing Co., possesses important advantages in combination with the Thomson-Houston electric motor. The pump offers absolutely even and unvarying resistance to the motor under all conditions, and consumes but a minimum of friction in parts. Careful tests of the outfit complete, have shown a high efficiency. The three-throw crank shaft, in the stroke of which there is no dead center, prevents jerky motion and vibrations. The pump and motor are mounted on one bed-plate, and are practically one machine, being thoroughly tested as such before going into active service.

In villages or cities, where power can be had from electric light or power circuits, electric pumping offers relief from the discomforts of insufficient or hard and unfit water supply, and the hardly lesser trials of disagreeable, noisy and dangerous pumping engines in vogue.

The Triplex Electric Pump will take water from any source, as spring, cistern or well and force to upper supply tanks of residences, shops, warehouses, buildings, etc., or force city water to a higher point than its own pressure will carry it, as is often the case in the more elevated city districts or very tall buildings.

In such factories as large cotton mills, woolen mills, steel works, etc., and in fact, in any large establishment where work is distributed over a large territory, the employment of electrical transmission of energy for pumping can be used to great advantage.

The steam pump is in common use. Steam is generated in the boiler and transmitted

through long lines of pipe to pumps, where the work of pumping is performed. It has been found by actual experiment and demonstrated time and time again that these direct acting steam pumps are wasteful consumers of steam.

With electrical pumping outfits all this is changed.

One of the most troublesome questions in mining operations is the disposal of water. By the introduction of electricity for underground work the problem is greatly simplified. The necessity for long lines of steam pipe is removed, and in the place of hot steam pipes spreading dry rot in the vicinity, a small copper wire is suspended from wall or ceiling; or, the current may be taken from the trolley wire if the mine is equipped with an electric haulage plant. In

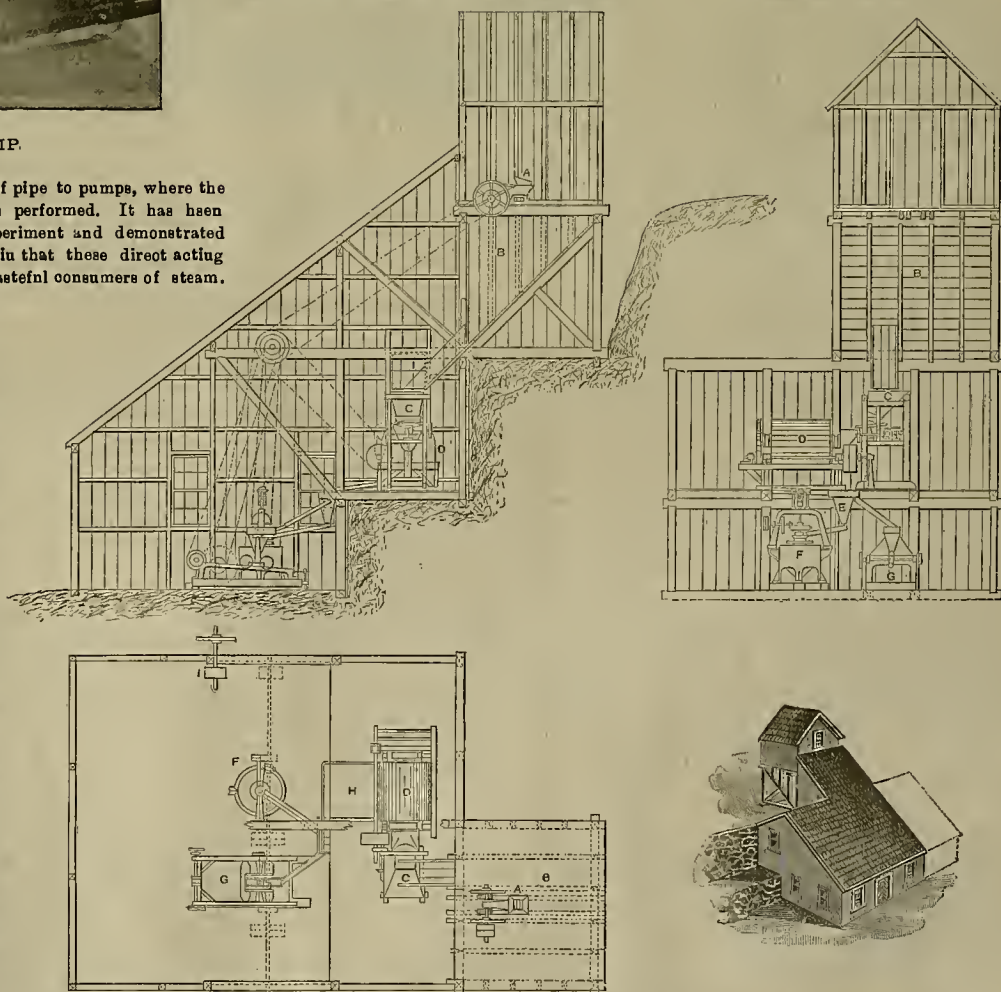

TUCK'S EXCAVATOR AND LEVEE-BUILDING MACHINE.—See page 269.

some cases, where transmission from the surface by steam or compressed air was utterly impracticable, and an underground steam plant seemed necessary, it has been found that the cost of excavating and drilling holes for the

chimneys would exceed the total cost of the electric pumping plant.

The accompanying illustration shows a Gould pump and Thomson-Houston motor, (Continued on page 269.)

THE "DODGE" PULVERIZING, AMALGAMATING AND CONCENTRATING MACHINE.—See page 269.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

Two Sides to the Question.

EDITORS PRESS:—Having formerly traveled in the mountains and lately visited the valley in the interest of Board of Trade, we find the debris question an absorbing topic in both sections. A friend, once miner, now farmer, proposed a solution worth notice and [apparently] fair. Those who have seen a great industry dormant in the mountains and in the valleys more than 50,000 acres rendered hopelessly sterile on the Yuba, Bear and American rivers, the navigation of the Sacramento imperiled and the harbor of San Francisco steadily shoaling, need not be told of its importance. The most ardent anti-debris champions say they would be glad to see every mine working full blast that can be worked without damage to others. Miners say they have bought property of the Government and are entitled to its protection. We believe that Government is bound to protect navigation and that it is a principle of law as old as the law itself that no man has a right to use his property to his neighbor's injury. We see nothing to prevent the bulk of the debris now in the streams from being carried down the Sacramento to the bay. As the river shoals, we see nothing to prevent an increasing tendency to seek new channels.

The Solution.

As rivers are national highways, and mineral lands were patented by Government, he claims that the United States should take control of the matter. Let a commission be appointed whose duty shall be to make expert survey of each mine. If it can be worked without injury to others, let them issue license prescribing the conditions under which it shall be operated. In case the mine cannot be worked, it should be appraised on a reasonable valuation, condemned, paid for and dismantled. The plant should be sold at public auction and site become Government property not eligible to future mineral location. In appraisal the commission should not award what it is hoped the mine may produce, but should be on a basis similar to former assessments for taxation.

Instead of awaking sectional hostility, as by present arrangement, he would have business carried on by strict U. S. regulations.

Sacramento and San Francisco are as vitally interested in this matter as Marysville. All these cities are almost equally interested in anything that will promote the prosperity of the mountains where their trade so largely centered in the palmy days of "And Lang Syne."

FRANK S. CHAPIN.

A New Concentrator.

Mr. George Johnson of San Francisco, a brother of Peter Johnson, Esq., of this city, has recently invented a new concentrator that promises to have a large sale in the market, as it will cost less and be much easier to take care of than any other machine. It is now on exhibition at the shop of the Union Machine Works, 130 Main street, San Francisco.

The machine is the lightest in the market, having less iron work than any other. Its length is 11 feet and its width 4 feet. The belts are made of prepared canvas, and are 26 feet in length by 4 feet in width. These belts will cost only about \$10, and will last from one to two years, being chemically prepared.

The machine has a side motion, running from 105 to 115 shakes per minute, with a throw or side movement of 2 3/16 inches. The dip of the table is three-fourths of an inch. The sides of the belt are not flanged as in case of the rubber belts, but are raised by means of a cone-shaped end on each roller. The belt is revolved by a screw gear which is quite simple. Between the stationary and movable portion of this gear, there is a piece of wire rope 22 inches in length which admits of a great deal of movement.

The table is suspended from non-parallel supports, and the belt is tightened by means of a sliding bearing with screw attachments. The side motion of the machine is produced by arms fastened to the frame. These arms are set in bearings which are capable of being extended or contracted, as may be desired, thus changing the throw of the machine.

Although not yet practically tested, it has been pronounced by those who have examined it to be a success. It is simple in construction, having no complicated parts, and will cost less than any concentrator yet put on the market. The cost will be about \$450, complete.

Mr. Johnston has written to the W. Y. O. D. Mining Company of this place, asking them to have a trial of the machine made in their mill, but as yet has received no answer. Each machine will answer for a battery of five stamps.—*Grass Valley Telegraph*.

LARGE BLOCK OF ASPHALTUM.—A four-horse team arrived at Santa Barbara on the 15th with a large block of pure asphaltum from the mine of the Santa Barbara Asphalt Company at La Patera, 12 miles west, to be sent to the Chamber of Commerce exhibit at Los Angeles. It was just as it was taken from the mine and weighs 2 1/2 tons. It is believed to be the largest piece of asphaltum ever mined in one block. The mine was opened about a year ago.

Sapphires and Rubies in Montana.

A London cablegram, published last week, told of the organization by the Marquis of Bristol, Earl of Mowbray, Sir Francis Knollys, the Prince of Wales' Secretary, the Earl of Desai and a dozen other titled Englishmen, of a gigantic syndicate to work rich sapphire and ruby grounds, 12 miles from Helena, Montana, on the Missouri river.

United States Senator W. F. Sanders of Montana, who is now in San Francisco, lives at Helena and tells much that adds significance to the discovery.

"It is true," he said, "that the English gentlemen have taken hold of the property. It was first brought to their attention through E. V. Smally, but the ground was largely worked over first for gold. The diggings lie on both sides of the Mission and comprise several old placer bars once known as Eldorado Bar. As far back as 20 years ago sapphires and rubies were found here. Several diamonds have also been found, and they were very good ones, too."

"The sapphires are of all sizes and colors. Some of them are of a pale blue; others are nitramarine, and still others are remarkably clear and white, and at night sparkle and twinkle with great brilliancy. In the Helena market they command from \$20 to \$200 each. I was shown recently by a jeweler there a tray of over 100 sapphires and rubies, gathered at random, that were very fine."

"The rubies are of all shades and make very handsome settings. There seems to be a great abundance of both, and I would not be surprised if many good diamonds would be discovered there. I was down on the grounds three weeks ago to-day. On one side of the river were eight men at work. I saw no new machine of the kind mentioned, but the miners were working as they would to find gold, the stones by their weight settling to the bottom of the rockers."

"I was shown about a quart of the stones that they had got out, and they were very pretty. I do not think the ground on the other side of the river, where the syndicate also owns property, was being worked then. I understand the men in the company have the control of the market on precious stones."

The property of the Montana Sapphire and Ruby Co. is located along the Missouri river, nearly north of Helena, distant about 16 miles, and comprises between 3000 and 4000 acres. The lands are the property of F. D. Spratt, who secured them by location and purchase. A gentleman named Streeter recently visited the properties, coming directly from the diamond fields of South Africa. In his report to the London parties interested, he said the fields were the greatest discovery since those made in Africa. The property cost Mr. Spratt about \$50,000. Since it became known that they were very valuable, but little information has been given out concerning them and only the parties interested know the extent of the fields or have any idea of their actual value. Considerable trouble has been experienced with claim jumpers, and the title to some of the ground is in dispute at present. To work the property it will be necessary to erect a powerful pumping plant to raise water from the Missouri river for sluicing purposes. Negotiations for the sale of the property to English capitalists have been in progress some time.

George Frederik Kunz, an expert with Tiffany & Co., author of a standard work on "Gem and Precious Stones," and Special Agent of the Census Bureau in the Department of Precious Stones, who made a personal inspection of the territory, spoke as follows to a reporter in New York regarding the Montana property:

"The only territory in this country which has been at all prolific of sapphires is the placer ground, six or seven inches in depth, between Ruby and El Dorado bars on the Missouri river, 16 miles east of Helena, Montana. Here sapphires are found in glacial, auriferous gravels, while sluicing for gold, and until now have been considered only a by-product. Up to the present time they have never been systematically mined. In 1889 one company took an option on 4000 acres of the river banks, and several smaller companies have since been formed, with a view of mining for these gems alone, or in connection with gold. The colors of the gems obtained, though beautiful and interesting, are not the standard blue or red shades, generally demanded by the public."

Mr. Kunz says that stones not of the standard colors are called fancy colored. Fine stones are worth from \$50 to \$100 per carat, but he said he could place no price on the fancy colored, which are much cheaper.

"Tiffany & Co.," he continued, "have not sold, nor did they send a true red ruby, or a true blue sapphire from Montana, but they have seen interesting fancy colors, the sale of which is very limited compared with the standard."

Mr. Kunz declined to estimate the value of the Montana bore. They are not being worked to any extent now, and there seemed to be little enthusiasm among the people of Helena about them.

IMPORTANT MINING SUIT.—A mining lawsuit which will attract widespread attention in the mining world came to trial at Butte, Montana, on the 15th. It is the case of R. C. Chambers et al., virtually the Anaconda Company, against P. A. Largey et al., for trespassing and damage in the sum of \$600,000. The

plaintiffs own the Bell mine, and the defendants, backed by a Colorado company, of which Henry Wolcott of Denver and Hon. W. A. Clark are members, own the Speculator mine. It is alleged the defendants have extracted ore from the Bell vein, which has its apex on the surface of the Bell ground, but dips north under the side lines of the Speculator ground and passes below the surface line of the Speculator lode. The main point involved is the question whether the Bell people have a right to follow their vein outside of the surface lines. The Speculator people claim that they have not—that the lines should be drawn downward perpendicularly. The Speculator people also contend that the Bell vein is only a spar of their ledge. Leading attorneys of the State and J. F. Vaile, of Denver, are employed in the case.

The Elevators of New York.

"The elevators in the sky-scraping office buildings, hotels and apartment houses in this city carry more passengers each day in the week, excepting Sunday, than do all the elevated railroads and street-car lines combined, and while the facilities of the latter are frequently taxed to their utmost, the capacity of the elevators for shooting people skyward is practically unlimited."

So spoke an expert in this branch of industry to a *Mail and Express* man the other day. At first sight his statement appears a little incredible, but any one familiar with the subject will readily believe it. Many of the larger buildings have as many as nine elevators each, and during the business hours of the day are run to their full capacity. They carry from 10 to 30 passengers on each trip, and few of them take more than two minutes to accomplish the round trip, many of them considerably less.

The Equitable building has nine high-speed elevators in daily use. A *Mail and Express* man asked the man in charge how many people availed themselves of this modern convenience in the course of the day.

"Oh, about 50,000," he replied, airily, "and that don't include beggars, peddlers and those who walk. Don't believe it, eh? Well, just try and count them."

The reporter did try to count them, but he might just as well have tried to count the hairs in the head of a Ciroasian beauty. Finally he devoted his energies to two cars, and found that the average round trip occupied a little over a minute and a half and the number of passengers carried on each trip was 30.

But the Equitable affords only a single illustration of what is done in a score or more office buildings down town. The Mills building has half a dozen elevators, which carry from 20,000 to 25,000 people daily. The great double building of the Manhattan company on Wall street has an unequalled system of elevators that carry nearly as many more, while the elevators in the Potter building, the Produce and Cotton Exchanges, and the Washington building relieve probably about 100,000 people more every day from the necessity of trudging wearily to the species among the clouds.

The speed of elevators varies considerably, and few if any are even now at their maximum.

There are several reasons for this. In the first place there is no necessity for it, and in the second the sensation produced on many people by a rapidly moving elevator is extremely unpleasant, closely resembling that caused by the rolling of a ship at sea. The speed varies from 100 feet a minute in the old-fashioned type of elevators to 2000 feet a minute in the improved pattern. The latter, however, are seldom run at a greater speed than 300 or 400 feet a minute.

Many modern residences on Fifth avenue and other fashionable thoroughfares are fitted up with elevators that are so simple of construction that almost any member of the family, or the servants can operate them. When it is remembered that many of these mansions are often six and seven stories high, the need of some easy method of "going up-stairs" becomes apparent. Many of these elevators in private dwellings are fitted up in the highest style of the upholsterer's art in order to be in harmony with their surroundings, and form a striking contrast to the old-fashioned, creaking, noisy "lift" of other days.—*Mail and Express*.

BANK GROWTH IN THE STATE.—Thos. Brown, cashier of the Bank of California and President of the California Bankers' Association, presented some interesting facts in his opening address to the convention yesterday. He said: "The growth of banking in the State in the last decade has been remarkable. On the 1st of July, 1888, the whole number of State incorporated banks in the State was 78, while on the 1st of July, 1891, the number was 149, showing an increase of over 140 per cent. Some of this was due to the incorporation of private banks, but most of the increase is due to new organizations, many of which have come into existence in places where previously there were no institutions of this kind. Eleven years ago, the 78 State incorporated banks reported a paid-up capital of \$25,127,140 and \$79,278,287 due depositors, their aggregate resources being \$119,575,520. At the beginning of the last fiscal year, the 189 State incorporated banks reported a paid-up capital of \$49,670,414 and \$105,776,311 due depositors, the aggregate resources footing up \$244,547,141."

Liability of Stockholders.

A recent decision handed down by the Supreme Court will be of especial interest to corporations in this State, as it enunciates a new principle in regard to the liabilities of stockholders. The case was that of *Baines vs. E. S. Bahcock, H. L. Story and Josephus Collett*, the defendants being sued as stockholders of the San Diego Street Car Co. It is generally known that stockholders in this State are subject to a "statutory liability"—that is, for a proportionate amount of indebtedness contracted while they are stockholders. But this late decision goes far beyond this, and holds that still another liability exists, so long as the stock remains unpaid in full. The decision, in brief, is that a creditor of a corporation, who has obtained judgment and had execution returned unsatisfied, may maintain an action against the stockholders for the benefit of himself and all other creditors who may come in, to recover the amount remaining unpaid on the stock, and have the amount applied in satisfaction of the judgment. To do this no assessment or action by the corporation is necessary. It is only essential to show a judgment against the corporation, return of execution unsatisfied, and that the defendant is holder of shares not fully paid, to entitle the creditor to a judgment for the amount due on the shares.

In such case, the judgment and execution are conclusive and cannot be disputed by the stockholder, and it is no defense to show that the stock was held only as agent or trustee, or for convenience. The only test is: Does the stock stand on the books of the corporation in the name of the defendant?

It is also decided that in this equitable action the creditor may sue any one or more of the stockholders, from which it results that a creditor may recover the entire amount of his debt from any one solvent stockholder, if he owes so much on his stock.

It will be seen that this decision is of vast importance, especially in this region, which is flooded with corporations, very few of which have capital stock paid up in full. The opinion was written by Justice de Haven and concurred in by the other judges. The judgment against the above defendants was for \$40,000.—*San Diego Exchange*.

The Technical Society.

The Technical Society of the Pacific Coast has issued a circular letter to the public, and particularly to the business world, in which they draw attention to the important part the technical professions play in the matter of industrial economy and the scope of the subjects that have come under the consideration of the society in the professional papers published by them.

The society was established in 1884, and since that time 74 exhaustive papers, dealing with almost every scientific subject and profusely illustrated, have been read before the members by the authors and then printed.

The object of the Technical Society is the professional improvement of its members, the encouragement of social intercourse among men of practical science, the advancement of the technical professions and the establishment of a central point of reference and union for members. In spite of many difficulties which have arisen from time to time since its establishment it has proved itself of great benefit to the engineering profession.

The feature of the institution in which the general public are mostly interested is its associate membership, which admits men who, by reason of education or business, are brought in contact with, are interested or in sympathy with the technical professions. In order to encourage this branch of membership a reduced rate of annual dues has been adopted.

The other grades of membership are what are known as members and juniors, and embrace civil, mechanical, mining and electrical engineers, architects, surveyors, chemists, naval architects and technologists.

Another advantage to the engineer is the exchange list, which includes about 200 publications of engineering and scientific societies in the United States and Europe. This feature is invaluable to resident members who are desirous of looking up information, while those at a distance who desire copies of the papers that have been read before the society can receive them through the mail.

THE FORMATION OF PROJECTILES by the electric welding process is proving to be of great value. The shells from modern rapid-fire guns have to be furnished with an intensely hard point for armor-piercing purposes, and except up to a recent date none except the smallest sizes have been successfully made. It looks now, however, as if the electric welding process would come into play with excellent effect, for it is now possible cheaply and rapidly to furnish the steel body of the shell with a chrome steel point that is all that can be desired.

DEFINITION OF THE SCIENCES.—At the jubilee meeting of the chemical society of London, Lord Salisbury offered the following definitions: Astronomy is largely composed of the science of things as they are; geology consists mainly of the science of things that probably were a long time ago, and chemistry is the science of things as they actually are at the present time. An electrical journal adds that electricity represents the science of things as they probably will be.

Popular Names For California Trees.—Continued.*

[Written for the Press by J. G. LEMMON.]

No. 2.—Tribe Abietineae of the Conebearers. Concluded.

The important tribe of Pitch Trees, or *Abietineae*, is very large and valuable. One of its most important families—the Pines—has been treated in a former number. Following are the remaining genera, the popular or English name which it is desired to establish, being given first, followed by the botanical name by genus and species, together with a brief description—for certainty of identification.

SERIES I. FASCICULARES.—Trees with the principal leaves mostly in fascicles or bundles of two to 60 leaves, each.

The Pines with leaves in fascicles of mostly two to five and sheathed at base and with cones diverse comprise the first genus or family and have been discussed.

The other two (or three) genera—True Cedar, Larb and False Larch (?)—have their leaves in fascicles of few to 60 tufted on the ends of short branchlets.

TRUE CEDAR.—*Cedrus*, Link. Trees with cones erect, large, depressed at the ends; the leaves persistent several years.

CEDAR OF LEBANON.—*Cedrus Libani*, Barreller. Leaves dense, green; branches flat, fan-shaped, on long drooping limbs. (Cultivated in Cal.)

TREE OF GOD, INDIAN CEDAR.—*Cedrus Deodara*, London. Leaves glaucous or whitish in

ALPINE WESTERN SPRUCE.—*Hesperopence*, Lemmon. Cones terminal, small, the scales usually reflexed at maturity; leaves scattered, (not in two ranks,) narrowed at base and with a single, large resin dot; seeds angular, and bearing resin vesicles; pollen bilobed.

PATTON'S ALPINE WESTERN OR SPRUCE.—*Hesperopence Pattoniana*, Lemmon. Alpine or sub-alpine trees of the Sierra and Rocky mountains. A solitary species usually classed with the Hemlock Spruces, but leaves not "in two ranks," etc.

HEMLOCK SPRUCE.—*Tsuga*, Carriere. Cones terminal, very small; leaves two-ranked, flat, not with prominent pulvina, etc., only one species in Northwest America; pollen discoidal.

WESTERN HEMLOCK SPRUCE.—*Tsuga Mertensiana*, Carriere. A large tree of the Northwest, reaching Northern California.

False Spruce.—*Pseudotsuga*, Carriere. Cones sub-terminal, with long, exserted bracts; or leaves between the scales; leaves petioled or stalked, leaving when fallen, oval, transverse near base, etc., Two species, both in Northwest America.

DOUGLAS SPRUCE.—*Pseudotsuga, taxifolia*, Britton. A large and valuable lumber tree of the Northwest; abundant in California.

BIG CONE SPRUCE.—*Pseudotsuga macrocarpa*, Lemmon. A very large-coned spruce, local on the San Bernardino and neighboring mountains of California. Trees less symmetrical than the other species.

SEO. 2.—ERECTUS.—True Fir, Cones erect, lateral, sessile, nearly cylindrical axillary from the upper side of mostly the upper limbs; the scales deciduous. Only one large genus

with the large midrib long exserted. Leaves very large and long.

A Southern California Apiary.

The engraving on this page shows the famous Sespe apiary. It is located in Ventura county, on the bank of the Sespe river, from which it takes its name. In 1876 R. Wilkin, of Caddis, Ohio, became tired of trying to winter his bees in that cold climate, and moved his large apiary to California, locating it on this spot. The ground has been occupied by bees ever since, but the hives have been changed and it is now owned by his son-in-law, J. F. McIntyre.

The grape vines in the foreground were planted soon after the apiary was located, and produced a heavy crop of grapes every year, with little injury, it is claimed, from the bees. The land slopes about ten feet from the back of the apiary to the honey house, which makes it easy to wheel the honey into the house. Two carts, shown in the foreground, are used to wheel in the honey. Each cart carries four "supers" full, or about 200 pounds at a load. When extracting, one man fills one cart with honey in the apiary, while the other extracts the other cart-load in the honey house. It takes from 20 to 30 minutes to fill a cart, and the man in the honey house can easily extract one in the same time. A three-inch pipe runs from a reservoir down through the apiary and connects with a Pelton water motor in the honey house, which furnishes sufficient power to run a small circular saw or

A High Dam.

An Immense Storage Reservoir.

It is with considerable satisfaction (says the San Jacinto Register of San Diego Co., Cal.) that we are enabled to day to give to the public the able report of Consulting Engineer J. D. Schuyler to the Hemet Water Co., relating to the company's reservoir. Coming as it does from Mr. Schuyler, who is known to have no superior in his profession on this coast, it means more than our readers can imagine to the San Jacinto valley.

It is double the capacity of the great Sweetwater, and equal to the celebrated Bear Valley reservoir. This we have from Mr. Schuyler himself, and he is in a position to know, having built the former, and is familiar with the workings of the latter.

Our readers will also be interested to know that we have here the highest dam in the known world. The following is the report:

Report on Lake Hemet Reservoir and Dam.

SAN JACINTO, Oct. 5, 1891.

President and Directors Lake Hemet Water Co.,—GENTLEMEN: The total capacity of the reservoir to be formed by the dam now being constructed by the company you represent has been a matter of vague conjecture until recently, when the minute and detailed surveys were completed by Mr. C. S. Alverson, from which I have personally made the following computations:

Height Above base of dam.	Area flooded in acres.	Storage capacity in gallons.	Capacity in millions of gallons for 6 months.
30 ft.	1.03	2,070,750	0.35
40 ft.	1.82	10,838,250	4.62
50 ft.	2.71	36,960,250	15.50
60 ft.	3.62	103,266,500	44.20
70 ft.	4.54	251,879,250	107.50
80 ft.	5.50	522,412,750	223.20
90 ft.	6.55	908,005,250	388.80
100 ft.	7.62	1,430,702,750	614.00
110 ft.	8.75	2,149,985,250	920.00
120 ft.	9.92	3,099,285,000	1,325.00
130 ft.	11.15	4,427,777,500	1,895.00
140 ft.	12.42	6,216,002,500	2,690.00
150 ft.	13.75	8,415,217,750	3,600.00

†The lowest foundations are 13 feet below base of dam proper.

The survey did not extend to higher levels than 150 feet, but judging from the rapid rate of increase above the 130 feet level and from the general "lay of the ground," I estimate that the capacity of the lake at the 160 foot level would be fully 11,500,000,000 gallons—or nearly twice the capacity of the Sweetwater dam. This would afford a constant flow of 4900 miners' inches for 180 days.

The present intention of the company is to construct the dam to the height of 150 feet, although I have laid the foundations sufficiently broad to enable you to carry the structure ten feet higher if desired. The class of masonry of which the dam is being built is certainly the finest I ever saw, and I doubt if it has any superior in America in works of that character. Blocks of granite weighing five to ten tons are set closely together in beds of Portland cement concrete, thoroughly rammed into all joints. When completed, it will unquestionably be not only the highest, but the finest dam on the continent, strong, safe, solid and secure for all ages to come. From my observations of the flow of the stream, I have no hesitation in saying that in my opinion the water supply from winter storms is sufficient to fill the reservoir to the height of 160 feet every year.

In addition to the flood waters of winter, the summer showers of July and August furnish no inconsiderable volume. My observation of several of these showers, which were of almost daily occurrence for several weeks, was that for an hour or two the stream would flow at a rate of 250,000,000 to 300,000,000 gallons daily, dir-minishing to the normal low water flow of about 3,000,000 gallons daily, in 15 to 20 hours. I think the reservoir would receive an addition of 50,000,000 to 150,000,000 gallons from each of these showers, and sometimes considerably more.

This source of summer supply, which is a resource peculiar to the Southern California mountain region, is likely to afford an effective increase in the duty of the reservoir of 10 to 15 per cent. The constant flow of the stream in summer is more than sufficient to offset the loss by evaporation on the surface of the lake.

As the area of dry lands in the valley requiring water is greater than any possible supply available, it seems to be a profitable and safe proposition to carry the dam to its utmost limit of height. It is possible to go still higher than 160 feet, but not advisable, on account of the necessity of building a considerable length of auxiliary dam in the gap in the ridge south of the main dam, the lowest point in which is 123 feet above base.

The masonry has now reached a height of 33 feet above base, or about 46 feet above the lowest bottom. The organization is fully effected and working smoothly, the plant is complete and operating successfully as planned, and with reasonably good luck the structure can be completed to the 150 feet level in a year from this time.

The thickness of the dam at the extreme bottom is about 100 feet, which is greater than its length, or the width between canyon walls at the height of 50 feet, dimensions which have no parallel for stability among dams in the known world. Yours faithfully,

JAS. D. SCHUYLER,
Consulting Engineer.

THE SESPE APIARY IN VENTURA COUNTY.

larger fascicles on fewer, more irregular branches. (Cultivated.)

LARCH OR TAMARACK.—*Larix*, Link. Trees with cones pendent on branches of the previous season's growth; leaves promptly deciduous.

LYALL'S OR WOOLY LARCH.—*Larix Lyalli*, Parlatore. Small trees of the Cascades and eastward to the Rocky Mts., the branchlets and cones clothed with whitish leaves, the cones promptly deciduous.

GREAT WESTERN LARCH.—*Larix occidentalis*, Nutt. Large, usually tall trees of the Northwest, on high or dry situations, peculiar for their thick bark and the cones bristly with long-exserted bracts.

SERIES II. SOLITARES.—Trees with all the leaves solitary, not tufted.

SEO. 1. PENDERES.—The Spruces. Trees with fruit pendent from or near the end of the branchlets. Four closely related genera, often considered as one polymorphous genus.

TRUE SPRUCE.—*Picea*, Link. Cones terminal, leaves scattered, sessile, with prominent, persistent bases or pulvinae.

WHITE SPRUCE.—*Picea laza*, Sargent. Trees of far northern regions, with glaucous or white leaves.

BLACK SPRUCE.—*Picea Mariana*, Sargent. Northern trees with dark green foliage.

ENGELMANN'S SPRUCE.—*Picea Engelmanni*, Engelmann. Rocky Mts. and westward to near California. Branchlets short and thick, cones elliptical.

PRICKLY OR BLUE SPRUCE.—*Picea pungens*, Engelmann. Rocky Mts. and westward to Wyoming, along streams. Remarkable for its sharp, very glaucous foliage.

GREAT TIDE-LAND SPRUCE.—*Picea Sitchensis*, Carriere. Reaches the California coast from the north. Large trees, with slender branchlets and cylindrical cones.

BREWER'S OR WEeping SPRUCE.—*Picea Breweriana*, S. Watson. A recent discovery on the Siskiyou Mts. Branchlets very long, slender and pendent, cones tapering to each end.

*The first article in this series was published in the RURAL of May 23, 1891.

well represented in the Northwest, including California.

TRUE FIR.—*Abies*, Link. Mostly large trees with branches in horizontal whorls or strata; the leaves two-ranked on young trees and lower branches. The Firs of Northwest America are comprised in two sections:

SEO. 1.—*Megacarpa*, Red Fir.—Species with cones large; bark red within; leaves short, mostly quadrangular.

AMABILIS, OR LOVELY RED FIR.—*Abies Amabilis*, Forbes. A rare tree on peaks south of the cascades of the Columbia and northward to Fraser river, cone bracts short, concealed.

NOBLE, OR BRACED RED FIR.—*Abies Nobilis*, Lindley. A rare tree near Mt. Hood, and in a few other northern localities. Cone bracts large, long-exserted and reflexed.

Magnificent or California Red Fir.—*Abies magnifica*, Murray. Attains the largest size of any tree of the genus; on high plateaus and mountains of California; bracts mostly concealed; variety, *Shastensis*, Lemmon. Shasta Red Fir, near Shasta, bracts exserted. Variety, *Xanthocarpa*, Lemmon. Yellow-fruited Fir, near Webber lake, cones, yellowish.

SEO. 2.—*Microcarpa*—White Fir, cones smaller; bark whitish within; leaves longer, mostly flat.

GRAND, OR OREGON WHITE FIR.—*Abies grandis*, Lindley. Large trees of the Northwest and reaching California. Leaves dark green.

LOW'S OR CALIFORNIA WHITE FIR.—*Abies Lowiana*, McNab. Common in the California mountains at middle altitude. Leaves whitened below and twisted at base.

GRAY LEAVED OR COLORADO WHITE FIR.—*Abies concolor*, Lindley. Summits of the watershed of the Colorado river, including the San Bernardino mountains of California. Leaves, large, whitened above and below.

DOWNY CONE OR SUB ALPINE FIR.—*Abies lasiocarpa*, Nuttall. Rare on high peaks of the Northwest. Cone scales bearing short, brownish hairs. Leaves small and very short.

BEAUFUL OR BRISTLE-CONE FIR.—*Abies venusta*, Sargent. Extremely local in the Santa Lucia mountains of California. Cone-bracts

the honey extractor. The honey runs from the extractor into iron tanks, shown below the honey house, which hold 8000 pounds each, where it is allowed to stand for one or two weeks, and is then drawn off through a molasses gate into 60-pound cans for the market.

This apiary made 27,000 pounds of honey last year and 9480 pounds this year. The hives are the Ventura county standard. They are really a ten-frame Langstroth without portico, and have a loose bottom-board. A blue queen-excluder is used between the upper and brood chamber and a painted duck-cloth under the cover. The apiary contains at present 475 colonies in large hives, and 100 nucleus hives for fertilizing queens. The nucleus hives have been added since the picture was taken.

The orchard back of the apiary contains nearly every kind of fruit, but the oranges and lemons are most profitable. Above the orchard on the hillside is the Sespe Land and Water Co.'s flume, which carries water to the orange and lemon orchards in the valley below. The water is taken from the Sespe river, which shows a little over the honey-house. The hill above the flume is a foothill at the base of San Cayetano mountain, on the north side of the Santa Clara valley. The mountains in the dim distance are a spur of the San Fernando range, which run down from Newhall on the south side of the Santa Clara valley. This valley is about three miles wide at this point, the conjunction of the Sespe and Santa Clara rivers, and is good orange and lemon land for ten miles above and below.

The Southern Pacific railroad runs down this valley from Newhall to Ventura. Fillmore is the town at this point; it has been built since the railroad came, about four years ago. Santa Paula is an older and much larger town; it is eight miles down the valley, is the center of the petroleum business in this county,

ALUMINUM AS A FLASH LIGHT, for photographic purposes is proposed. It is said that a mixture of powdered aluminum and chlorate of potash gives a brilliant flash without the smoke produced by magnesium.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

THE CLINTON CON.—*Ledger*, Oct. 17: The company are erecting vast surface improvements, and this would naturally lead to the conclusion that they have a paying property. The company are certainly employing a large number of hands, never 50. An engine and two large boilers were hauled by Picardo's team from Lone to the Clinton Con. last week. They aggregated 20 tons in weight. The company continue to make extensive improvements of a solid and permanent character. At the Kennedy, they are engaged in sinking the sump in the main or south shaft, below the 1450 level. The work of opening up a new level at 1450 feet will commence about the first of November. The shaft at the South Eureka has reached a depth of 190. It is still in the slate of the mother lode formation, with stringers of quartz occasionally met with. It is probable that, before the end of winter, drifting will be inaugurated.

NEW YORK MINE.—*Dispatch*, Oct. 17: Several tons more of castings for the New mill at the New York mine were brought up this week, and the remainder will be there in a day or two. Everything is being pushed ahead as rapidly as possible, and the new mill will soon be grinding out the precious metal.

Calaveras.

MURPHYS MINES.—*Prospect*, Oct. 17: The dazzling richness of the mine of Marco, the Austrian, situated at Indian creek, is now the absorbing topic. Marco's mine is near the place of old Fredrick above the Esmeralda. That section was prospected several years ago by various persons and some rich threads of quartz were then discovered. They were so small, however, that the claimants eventually abandoned them. Subsequently Marco and his partner began a tunnel upon one of the small traces and were bappy to find that the vein widened and continued to do so until now there is a vein of a foot or more. Visitors to the place affirm that it is the richest mine known in these parts and that the rock literally clings together with gold. The old Green mine at San Domingo now the property of A. Shaw is shut down at present although the work done by the present owner was encouraging. A good custom mill somewhere around Murphys would be a good thing and be an incentive to opening and prospecting mines that might ultimately lead to something extensive. The old Washington mine at Indian creek, commonly known as the Woods, is progressing in a satisfactory manner, while the splendid new mill being built is daily nearing completion, and by the first of next month, it is thought, will be ready for operation. That section is at present undergoing a boom, and rumor says that all the available discoveries that have ever been made are being gobbled up, and prospected by speculative persons. The project of running the tunnel through Douglas hill by McCormick, Bisbee, and Thomas, is still prominently before us. Mr. McCormick is expected to be up this way soon to make arrangements together with his partners to start the work. Some preliminary moves will necessarily have to be made and then the work of running a long tunnel will be earnestly commenced. This claim will employ about 20 men, and it will take about one year to complete the tunnel through the hill. Then a large flume will be put in and deposit its tailings on the Calaveras side.

WEST POINT.—*Cor. Calaveras Chronicle*, Oct. 17: Our mining interests are doing well. Considerable bullion has been sent from our district within the past month, besides rich rock that has been sent below to be worked. The Lone Star, Blazing Star, Paddock, Riverside, Herbert and Bardsley mines are all taking out rich rock which will net well up to \$100 per ton free milling. We understand that the old Woodhouse mine has been sold to Mr. Hill and other capitalists from Michigan, who have already commenced to develop this valuable property. Work has already been pushed forward in a business manner, and contracts have been let to Mr. Kilgore and others for its development. In the near future we will once more see the old Woodhouse one of the producing mines, as it was in the days of '50 and '60.

QUAKER CITY.—The work of timbering the Quaker City mine is proceeding satisfactorily.

HARDENBURGH.—Good track is being taken out of the Hardenburgh mine at Middle Bar.

El Dorado.

MILL.—*Georgetown Gazette*, Oct. 15: Preparations are going on at the Darling mine for the building of a ten-stamp mill. D. C. Hart and Denver B. Craig are sluicing on Otter creek, on the Abbey claim, with good results. Mr. Barry Baldwin of San Francisco was up last Sunday on business connected with the Van mine. He returned well pleased with the plans now being carried out for the working and developing of the mine.

Humboldt.

PROSPECTING.—*Arcata Union*, Oct. 17: There is some stir in prospecting and locating claims in the Willow creek section just n.w. Several locations have been filed recently, the latest being on Monday last. It was that of the location of the Emma and Edith placer mines and was filed by U. Stewart, Edwin Meller, D. Shively and Henry Gramocini.

ASBESTOS.—*Arcata Union*, Oct. 17: The deputy State mineralogist who passed through this county two weeks ago made his stay too short to visit several deposits in the vicinity of Maple and Boulder creeks, where there are beds of magnesite, plumbago and asbestos, all of which are to be found at different points along the banks of those streams. On Lord & Sherburne's ranch an asbestos bed is now being opened, and if it proves as valuable as anticipated, a company will be formed to work the mine. One incentive to open this mine is the fact that silver is nearly always found in the vicinity of asbestos. There is much valuable mineral in our county, and no doubt but fortunes are awaiting the operation of enterprising prospectors.

COAL, GAS AND OIL.—*Blue Lake Advocate*, Oct. 17: A. Norton of this place has entered into an agreement with D. W. Minn by which the latter secures the privilege of prospecting for coal, gas and

oil on the 1140 acres of land belonging to Mr. Norton and situated on this side of the river. Mr. Minor, we are informed, is going to work with drills just as soon as the necessary arrangements can be made, and if coal, gas or oil exists on Mr. Norton's land in paying quantities, the fact will be established very soon. The place at which, we are told, the work will begin is about one mile from Blue Lake, where a vein of coal crops out of the ground. A number of specimens have been taken away from the locality which are pronounced superior in grade to any yet mined on the Preston ranch. Lignite, which the coal thus far taken out on Maple creek seems to be, is of more recent origin than the anthracite and bituminous coal series and not so good. The specimens shown from the outcroppings on the Norton place are either bituminous coal or a superior quality of lignite. The fact that gas escapes from fissures in the ground on the Norton ranch, and that the sandstone is manifestly impregnated with petroleum, is taken as proof positive that both may be found in larger quantities beneath the surface. Whether this trio of good things, or any one of them, exist in paying quantities, time will tell.

Inyo.

SODA.—*Inyo Independent*, Oct. 17: A large quantity of soda is being produced by the works at Keeler. On Tuesday, three carloads were shipped, and two or three cars are forwarded every trip. It is rumored at Keeler that the property has changed hands, that an English company has purchased the works and locations, and that the works will be greatly extended. If this is done, it will mean added prosperity for the farmers of this section.

BODY OF ORE.—Recent reports from Modock indicate that the largest and most valuable body of ore ever struck in Inyo county is in sight there. An expert miner who came in from there early in the week says that the ledge is very large and has every indication of being permanent.

Nevada.

CALIFORNIA MINE.—*Grass Valley Union*, Oct. 17: The prospects of the California mine, at Deadman's Flat, continue to grow more and more encouraging. The vein now below 200 feet is nearly the full width of the shaft, and the proportion of waste to quartz is very small, only about one in 12. The quartz now being taken out goes up by tests to \$45 per ton, mill process, while the sulphurets assay \$120 per ton. There are now 50 tons of ore on the platform and another platform is being constructed of larger capacity, so that when the new five-stamp mill is ready to start up, which will be about the 10th of November, there will be a good supply of ore to work on. The rich pay shoot in the mine, which was struck above, has not yet been encountered in the shaft, but will be when the shaft reaches about 20 feet deeper, where the quartz is expected to be of very high grade. To all appearances, the California will be a dividend payer in the course of a few months.

THE WYOMING CONS.—*Grass Valley Union*, Oct. 17: Yesterday morning the Powning vein in the Wyoming Cons. mine was struck in the crosscut which has been run from the bottom of the prospect shaft. This is the second vein cut by the crosscut. The Powning vein is the one that was being particularly sought for, as it is the same that gave excellent prospects many years ago. The vein at the point where it is now cut is 12 inches in thickness and of excellent quality, as it shows in free gold, galena and heavy sulphurets. The parties who are working the ground under lease from the company are highly pleased with their prospects, and have good reason to be from the appearance of the quartz, which is as good as has been seen from any mine in the district for some time.

THE GOLD FLAT.—*Transcript*, Oct. 17: The Gold Flat Mining Co., operating on Gold Flat, a mile and a half from this city, is a local corporation. The principal stockholders are John Skewes, John Glasson, P. F. Simonds, W. J. Mitchell, Mr. and Mrs. James Watt, Mr. Brown of Oakland, the Wasley Bros. (Samuel, Charles and Thomas), Edward Trengrove and a few other well-known citizens of this city and Grass Valley. The company owns the remainder of Gold Flat quartz claim, as it is called, and holds bonds on the Gold Flat, Potnsi and Mohegan claims. All these properties are patented and together embrace about 40 acres of land lying in the mineral belt a quarter of a mile below the famous and long-lived Pittsburg mine and between that and the New England (or Thomas), which has also produced largely in former years. The company began work two months ago, erecting one of the best hoisting and pumping rigs in the county on the old Bruce E. Lee incline, within the limits of the Remainder claim and some 50 feet from the N. C. N. G. R. R. The machinery, which has for its motive power two Pelton wheels, is covered by a new building 26x76 feet in dimensions, and close to it is a magnificent site for the mill, which will be constructed later. The land is covered with an abundance of timber for mining purposes. The large double-compartment shaft sunk by the former owners, who went down 300 feet and from the drifts run took out considerable high-grade ore and not a little of "specimen quartz," has been cleaned out and timbered by the Gold Flat Co. for a distance of 40 feet from the surface. Within 20 feet more they will reach water, below which point it is pretty certain the workings will be found almost, if not entirely, in their original perfection. The water will be pumped out by the close of this month, and then a drift to tap the Potnsi claim, which was worked to water level in early times and gave very large profits, will be started. At John Tamblin's ranch, on the ridge 1900 feet southeast of the works, a reservoir has been constructed, and the water for turning the wheels is to be purchased from the South Yuba Co. There will be a fall of over 300 feet. The laying of the pipe line to connect the reservoir and the hoisting and pumping machinery is nearly finished. John Skewes, one of the best mine managers anywhere, and under whose administration the North Banner mine was so successfully opened, is the superintendent in charge. The company is out of debt, and with the splendid location and capable management, it is pretty certain to soon be among the dividend payers.

THE TELEGRAPH MINE.—*Grass Valley Telegraph*, Oct. 17: Buildings are now being erected on the Telegraph mine to inclose the machinery which is ready on the ground to be put in place. The Telegraph adjoins the W. Y. O. D. mine, and is certainly favorably situated for a good future.

The shaft on the mine is down 110 feet and all the machinery and everything else paid for to date.

IDAHO MINE.—Supt. Edward Coleman informs us that the water will be entirely out of the Idaho mine to-morrow and that on Monday all manner of work about mill and mine will be resumed in full blast.

MINES TO BE WORKED.—The Green Mountain and Sanders mines, owned by Elam Biggs and Wm. George, have been handed to John Rawling Sr., Alfred Kinsman, John Abraham, Joseph Bartell, Henry Ford, Richard Gluyas, John Wellington and Wm. Reed, all working miners. The hood runs for three years and is in the sum of \$25,000. The Green Mountain has been worked only to 150 feet of vertical depth and the Sanders to about 200 feet. The joint product, with this shallow working, has been \$170,000. Some of the ore has yielded \$372 a load, and the average has been high. Work will be done through a shaft on the Sanders mine, on which there is good machinery. The new proprietors expect to have the water out of the shaft by the 1st of November.

Placer.

THE THREE STARS MINE.—*Herald*, Oct. 17: We learn from Supt. Werry that the work of pumping the water out of the Three Stars mine was completed last week, and on Saturday the first shot was fired in the bottom of the shaft toward sinking it deeper. The rock that was loosened by the blast showed liberally in free gold and all concerned feel very much encouraged. Two of Mr. Werry's old miners, Stephen Johns and John Murley, of Colfax, came down Monday to go to work in the mine. When the Three Stars was last worked by the lamented Hawkins and Pearson boys, who lost their lives in the mine by an accident, it had the reputation of being notoriously rich, and the indications all go to show that its richness is not a thing of the past.

FROM AN OLD MILL.—The old Pelster quartz-mill on North ravine was recently torn down and moved away. Henry Mundt, with a knowledge of quartz-mills and an eye to business, bought the right to clean up or mine the ground where the mill stood for \$100. It only took him a few days to wash the dirt and he cleaned up between \$400 and \$500 worth of amalgam, making something like \$300 on his speculation.

Plumas.

QUARTZ.—*National*, Oct. 17: Gus Wolters of Crescent has been working some very fine quartz in the Crescent mill from his ledge on the hill near the Southern Eureka. The old Kettle mill at Round Valley is running steadily on rock from the McGill and Standart Con. quartz mine with good results. This property is under the management of that prince of quartz miners, Geo. Standart, and hides fair to be—if not already—one of the best quartz properties in the country. The John Bull mill, in North canyon, below Round Valley, under the management of Samuel Firststone, is running on rock from the Johnny Bull mine with good success. Last week we mentioned the fact that Thomas & Thompson proposed to raise from their tunnel in the Fairlake mine. We are pleased to note this week that a fine channel of gravel was reached Thursday at a height of 15 feet. This enterprise is an assured success. Mr. Whitney of the Crescent mine is on the last 50 feet of his shaft, with the indications favorable for a permanent mine.

MINING NOTES.—The mining interests of this section are booming at present. The Eclipse quartz mine of this place is running in full blast, under the management of Mr. E. D. Bowman. The Good Hope mine of Buckeye is at a stand-still, with A. Holtz as superintendent. W. A. James & Sons are pushing their tunnel ahead in bedrock, but expect to strike gravel soon. Turner & Co. are pushing the Red Slide ahead as fast as possible. N. Mullen is running the Blue Nose tunnel ahead, with no signs of gravel yet.

San Bernardino.

THE TIN MINE.—*Los Angeles Express*, Oct. 17: United States Marshal Geo. E. Gard has been spending a few days at the Temescal tin mines. He says he found the company working 113 men, only 20 being Cornishmen, and 12 of those having lived in California from 10 to 30 years. About one ton of pig tin per day is being turned out, with 40 men working in the mines, and the ore is being taken from a four-foot vein and averages eight per cent tin. The 60 mines of tin in Cornwall, England, average 1½ per cent tin, but the labor there is much cheaper than it is here. There wages are about \$5.50 per week; here they are about \$2.75 per day. They are taking out 60 tons of ore per day. This ore is manipulated on a five-stamp mill and two pneumatic crushers with a capacity of 24 stamps each. It then goes through a refining process by hand, after which it passes to a concentrator, from which it emerges about 70 per cent fine tin. It is then mixed with ten per cent anthracite coal and two per cent of lime, and placed in a furnace to flux, the heat for this process being furnished by burning oil. It remains in this state for hours, when it is run off into kettles, the dross separated from it and molded into pigs, each pig weighing 60 pounds each, worth 22½ cents a pound, or \$500 per ton. Besides the vein, which is at present being mined, there are 500 veins on the property within a distance of 700 feet from the one being worked, and the operators claim that there are 30 veins traceable on the property. Two shafts are now going down on two other veins. One is 30 and the other 60 feet deep. The development of the lead now being worked is in two levels, the lower one being 182 feet deep, the upper level being 400 feet long. Arrangements are now being made to crosscut the lead. The lead now being worked is called the Calajco. Enough water is now being pumped from the river to furnish all purposes of the work. The company is nevertheless building a dam at the mouth of the Temescal canyon, 2½ miles away, and is sinking to bedrock to get foundations. Not only is enough water to be stored here to supply all possible work of the mines in the future, but enough will be had to irrigate about 3000 acres of adjacent farming lands, upon much of which the miners will live. The money invested here by the English syndicate who owns it is not less than \$750,000. A report recently made by the superintendent to the company's directors in England states that the mine is now on a paying basis, and that it will justify further development. The ore is entirely pure save a little copper and iron found in all tin ores, and which no account of is taken.

San Diego.

JULIAN.—*Sentinel*, Oct. 14: The Helvetia stamps are busily dropping on hnanza ores. The ledge underground continues strong. After a short delay, work is again resumed upon the tunnel to the Big Blue. The Eagle boys are following a vein of very rich rock. C. E. Smith was quite severely hurt last week by a cave in at the tunnel he and Geo. Plant have been running near the Washington. The accident has compelled the men to start a new tunnel. The old stand-bys—the Ruby, Cincinnati Belle, Warlock and Gold King—are all working magnificent rock.

Shasta.

ELECTRIC DRILL.—*Shasta Democrat*, Oct. 14: An electric drill, the first ever used in California in mining operations, arrived here from the East a few days ago, consigned to the Gladstone Mining Co., whose property is situated on Kline gulch, in French Gulch mining district. The whole piece of machinery weighs about 12,000 pounds. With the latest improved machinery for drilling, the company will make very rapid progress developing their group of mines.

CLOSED DOWN.—The chlorinating works at Kennett have been closed down, and Mr. Price, the superintendent, will go from here to Arizona, and in December will start for South Africa, where Mr. Butters has been for a year erecting reduction works for an English mining syndicate. Upon the arrival there of Mr. Price, Mr. Butters will return to California, and, so we understand, will greatly enlarge his plant at Kennett.

THE NEW PROCESS.—*Redding Free Press*: The mill of the Shasta Gold Extraction Company, built expressly for the new English process, is all ready to put in motion as soon as they receive the chemicals now daily expected.

BULLION.—*Shasta Courier*, Oct. 17: Bullion to the amount of 28,000 ounces, was hauled through town last Tuesday, from the Last Confidence mine at Iron Mountain. The Bricks were shipped to the Selby Smelting Works.

Sierra.

GRAVEL.—*Mt. Messenger*, Oct. 17: We learn that gravel has been reached in the main tunnel at the Golden Giant claim, below the Mountain House. As we remember, three shafts were raised in this tunnel, the first two nearly 100 feet high. What distance the third was put up, we do not know.

CARNEY.—The Carney ledge, in Jim Crow canyon, where it has been recently crosscut, is said to be 30 feet wide, with 26 feet of good ore. Another crosscut, a thousand feet farther north, near the surface, has the same width and quality. The mill is run only about seven or eight hours a day, that being all the water will do. Mr. Wittenmyer of Martinez and Mr. Rouse of Antioch were up in Jim Crow canyon several days this week, examining the quartz mine owned by Jo and Jesse Carney. As we are informed, these gentlemen have advanced the money used in prospecting the mine during the past few months. Mr. D. A. Rouse has been superintending the work of exploration.

SIERRA BUTTES.—It is rumored here that the Sierra Buttes M. Co. has found such prospects somewhere in its mine as will warrant it in putting up another ten-stamp quartz mill.

Siskiyou.

GRAVEL.—*Yreka Journal*, 14: Work has been shut down temporarily at the Yreka blue gravel mine, but the directors are making arrangements to continue sinking the shaft soon again, in order to strike bedrock before winter, if possible. The Greenhorn blue gravel mine of Lee, Lash & Co. is paying big again, the rich channel having been found in their new shaft near stage road. This company has an immense area of rich paying ground, and will take out considerable gold from now on.

CHINESE WORK.—The Bentz Bar claim at Klamath river, near Honoluli, worked by Chinamen, is reported as yielding very rich returns. The Chinamen admit taking out between \$40,000 and \$50,000 this season, but it is the general belief that this is just about one-fourth of the amount they have realized. The Chinese claim, near the old Fort Jones claim, farther down the river, is also paying handsomely, and the Phil Mott claim still farther down stream on the Klamath has also been yielding an extensive quantity of the glittering dust.

QUARTZ.—A stage load of experienced miners arrived here by last Sunday's train from below for the Spencer quartz mine, on Humburg, and were immediately taken to the mine by four-horse team, which was at depot awaiting them. This mine is being worked energetically at present and is said to be paying well.

Tuolumne.

STANLEY.—*Tuolumne Independent*, Oct. 17: Superintendent McCann informs us that the Stanley mine is a paying property. He figured on the ore going \$250 per ton, but so far the ore milled went considerable above the expected figures.

NEVADA.

Wahoe District.

SAVAGE.—*Virginia Chronicle*, Oct. 15: During the week we have hoisted 531 cars of ore from the 500, 750, 950, 1100 and 1450 levels, shipped to the Nevada mill 525 tons, and milled 500 tons, average assay value as per battery samples of \$18.64 a ton. We have bullion on hand on October account amounting to \$9688.75. We have started work in the ledge from the main Suro tunnel, where it intersects our ground on the 1650 level.

HALE & NORCROSS.—On the 1100 level, from the east crosscut on our north boundary, we have extracted 72 cars of fair-grade ore. The main incline was repaired and retimbered 20 feet, making its total depth below the 1500 level 238 feet. It has reached the Suro tunnel level, through which we are now transporting the most of our waste rock.

KENTUCK.—The east crosscut from the bottom of the 1000 level north winze is in a distance of 12 feet; face in low-grade quartz. Are now up 21 feet on the ore streak above the south drift from the north rise.

JUSTICE.—The north drift on the 450 level was cleaned out and retimbered a distance of 45 feet

during the past week. The south drift from No. 2 crosscut, 622 level, was timbered 20 feet during the week; total length 195 feet.

CROWN POINT.—The main crosscut from the south lateral drift on the 600 level has now a total length of 162 feet; face in porphyry and streaks of quartz with considerable water running from it.

BELCHER.—The east crosscut on the 200 level has been run a total distance of 81 feet. It has passed through five or six feet of quartz yielding fair assays, which is being saved for pay. Have stopped the crosscut and are now running north from it on the quartz.

SEC. BELCHER.—The west crosscut from the south lateral drift on 600 level is out a total distance of 406 feet; face in a mixture of porphyry and streaks of quartz.

YELLOW JACKET.—Shipped to the Vivian mill during the week 40 tons of silver-bearing rock, and 100 tons of gold-bearing rock to the Santiago mill. The usual prospecting is being done.

SCORION.—The joint north drift, 900 level, has a total length of 544 feet; face in porphyry and clay. The water from the face is about the same as at the last report.

Lodi District.

PURCHASED.—Belmont *Courier*, Oct. 20: Alfred Welsh has purchased the Lodi mining property, situated at Lodi, Nye county. We learn that it is his intention to work this mine on a larger scale and that at least 20 miners will be immediately employed in extracting ore. The Lodi mine has produced large quantities of rich silver ore, and there are still large quantities of pay rock in sight. Lodi will soon be a lively camp again.

BRITISH COLUMBIA.

TRAIL CREEK DISTRICT.—Nelson *Miner*, Oct. 16: While other sections are having their excitement and stampedes, Trail Creek is by no means depopulated or overlooked by prospectors. While other districts may employ more men, Trail Creek claim owners are doing their share of development work. While other towns are putting on frills the town of Trail is certainly holding its own. All this is encouraging, and goes to show that the men who have spent time and money in Trail Creek district have faith in the future of the camp. A number of men are working on the Le Roi cleaning out the old shaft; when cleaned out, sinking will be resumed. A party of five prospectors have made between 12 and 15 locations on the summit of the divide between the North Fork and Sheep Creek, to the south of the trail. From assays obtained the ore runs about \$80 in silver, and when concentrated \$300 in silver and 55 per cent in lead. J. C. Boone, Andrew Simons and Arthur Finch have discovered a 10-foot ledge about 1½ miles north of the trail, from which they expect to make a stake, as it is a fine surface showing.

IDAHO.

AT FLINT.—De Lamar *Nugget*, Oct. 16: The mill at the Flint mines, which has had the stamps hung up for a fortnight, is now at work again. The stop was made to connect the well, sunk to supply water, with the bedrock under the creek. An ample supply of water has been secured. Twenty more stamps have been ordered, and the foundations are now being prepared for them. A new, large Corliss engine will be put in. J. D. Ludwig has again put a force of men on the Stoddard mine, and is sinking the incline near the south end of the tunnel. He will soon begin a shaft on the ledge near the west line of the property. The ore in the incline, he reports, is looking much better. The work recently done by Frank Lephay on his Ohio mine, southeast of the Stoddard, goes a good way toward proving that the great Wilson ledge continues south through the mountain. The ore is very rich, and the quartz of the same character as that in the Wilson. The same character of ore has also been found in the Midnight claim, 4000 feet further south.

MONTANA.

THE BOULDER DISTRICT.—Montana *Mining Review*: The Boulder district, in Park county, is rapidly gaining prominence as a mineral section. The owners of the Independent mine propose to put in a 10-stamp mill at once, with a complete process of saving all there is in the rock, an estimated loss of \$3 per ton having resulted from the method of treatment heretofore employed. The owners of the Crown are confident they also have a good property. The company operating the Hidden Treasure mine are putting up a 10-stamp mill at a cost of \$7500, and it is claimed they have ore enough in sight to pay for the mill. Their ore is quite rich, showing free gold. The Poorman Company is also putting up a mill of three stamps. They have uncovered a very rich vein of ore and are now sinking a working shaft, from which they intend to crosscut to the vein as soon as they have reached a sufficient depth.

NEW MEXICO.

SMELTERS.—Silver City *Enterprise*, Oct. 16: The Socorro and El Paso smelters are so crowded with business that they have been refusing ore from this section. This speaks well for the general prosperity of the country, but is a strong indication of greater smelting capacity needed at the points named or the erection of new works at this city. The Flagler Works of this city will soon be in the field buying and treating smelting ores, but unless its capacity is speedily increased, the local market will soon again be oversupplied. The Grant County M. & M. Co. of this city, which makes a specialty of low-grade silver ores, is crowded to its utmost capacity and is running day and night. The demand for greater facilities for handling the ores is so apparent that several mining men of note are contemplating the erection of a smelting plant in this city. The maiden brick of the Last Chance Mining Co. arrived Monday night. The brick weighed 46½ pounds, and carries considerable gold. It was valued at \$1227.60 and was the product of 7138 tons. The ore was saved fully as high as expected, considering that it was the first run made on ore. Judge Jno. M. Wright, the promoter of the enterprise, states that the run was satisfactory to the management and that the same ratio handsome dividends can be declared.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING OCT. 13, 1891.

- 461,177.—SLAT FASTENER FOR BELTS.—M. Arnold, S. F.
461,402.—COMBINATION TOOL.—E. A. Cochran, Pasadena, Cal.
461,102.—HIPPODROME AERIAL RAILWAY.—J. B. Gerber, S. F.
461,346.—GAME APPARATUS.—E. Krehs, San Luis Obispo, Cal.
461,365.—PRESERVING TIMBER.—J. McKeon, Oakland, Cal.
461,120.—CULINARY BOILER.—F. McKinley, Acme, Wash.
461,361.—CAR VENTILATOR.—A. Minnick, Colton, Cal.
461,366.—EXTENSION LADDER.—I. H. Odom, Oakesdale, Wash.
461,172.—CULTIVATOR.—Jas. Porteous, Fresno, Cal.
461,049.—NEWSPAPER HOLDER.—W. C. Roberts, Sausalito, Cal.
461,174.—DIRT SCRAPER.—Smith & Hopkins, Fresno, Cal.
461,374.—HAY RAKER, ETC.—M. M. Sornborger, Round Mountain, Cal.

The following brief list, by telegraph, for Oct. 20, will appear more complete upon receipt of mail advices:

California.—Peter Bargion, Oakland, chair plate for compound railway rails; John O. Cottrell, Riverside, wrench; Isaac S. Goldmann, Redlands, coupling; Warner L. and E. C. Keller, Azusa, adjustable extension revolver stock; Paul C. Salsesvain, San Jose, gas or gasoline vapor engine; August Schilling, Oakland, box lining; Courtland Sims, Los Olivos, Santa Cruz, cultivator; Wm. W. Slater and H. C. Barnes, Oakland, bolling-attachment; Adolph Somers, Berkeley, lubricant; Andrew H. Weir, Los Angeles, car coupling; Sidney B. Whiteloid, San Francisco, stamp-rolling and change-returning machine; John T. Wilson, San Francisco, engineer's air-brake valve; Oregon.—John B. Mahana, Free Water, three patents, one for a locomotive, one for a car for single railway and a third for an elevated railway. Washington.—Remembrance L. Kirby, Pomeroy, whitetree, clip and hook; John W. Seibert, Medical Lake, propelling wheel.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order.) American and Foreign patents obtained and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SLAT-FASTENER FOR BELTS.—Matthew Arnold, S. F. No. 461,177. Dated Oct. 13, 1891. In the formation of what is known as carrier belts—such as are employed in harvesting and thrashing machinery—it is usual to employ two leather or other flexible belts, which are fixed to transverse wooden strips at short intervals, the leather belts traveling over supporting driving pulleys, and these, with the transverse strips, form the entire belt when used as a straw-carrier; but when used to convey grain or mixed grain and straw, there is an intermediate belt made of canvas or suitable flexible material extending from one side to the other and covering the transverse wooden strips. This invention is designed to provide a convenient means for securing the flexible fabric and belts to the wooden strips in such a manner as to firmly secure the parts together and to preserve the wooden strips from danger of splitting and breaking while in use. Hitherto it has been customary to secure these parts together by boring holes through the wooden strips near the ends and riveting the fabric to the strips. This inventor employs inclosing clamps or rivets made in the form of hauds stamped out of sheet metal. By using this, the strips are held in place firmly, and cannot split or break.

DIRT-SCRAPER.—Daniel W. Smith and James K. Hopkins, Fresno, assignors to James Porteous, same place, No. 461,174. Dated Oct. 13, 1891. This is one of that class of dirt-scrapers in which the turning bowl is provided with a stop bar adapted to limit the dump of the bowl by contact with the draft links. In this class of scrapers it is desirable to limit the dump of the bowl both to regulate the discharge of earth therefrom and keep the handle from falling too far forward. This limitation is effected by means of what is known as a stop bar, which extends across, above the bowl, being secured at each end, usually to the arms of the bowl. It is also desirable to provide for the adjustment forward and back of this bar in order to limit the dump of the bowl at different points, to regulate the distance of the bit from the ground and thus govern the discharge of the dirt. This has heretofore been done by means of holes made in the arms on which the bar rests and bolts passing through the ends of the bar and adapted to fit in any of the holes on the arms, whereby the bar may be moved to and secured in different positions. These bolts become rusted very soon and it is very difficult after the bar has been in place for any length of time to remove the bolts in order to adjust the bar. Another difficulty with this old form of connection is that the arms in which the holes are, get bent and out of place, so that it is difficult to get the bolts out and put them back again. Also, as the bolts have to be wholly withdrawn from the holes each time the threads become injured, materially affecting the life of the bolt. The object of this invention is to provide a means for securing the stop bar to the arms, of such a character that said bar can be readily loosened and moved to adjust it at different places.

CULTIVATOR.—James Porteous, Fresno, No. 461,172. Dated Oct. 13, 1891. The blades or teeth of cultivators, after being in use, get dull and become beveled on their under edge to a plane parallel with the horizontal line of the frame to which they are attached. Now if the teeth are so connected with the frame that they can be moved through a slight arc, it is obvious that a new line of contact of their beveled under sides with the earth will be presented and further use will therefore

sharpen them, and this will continue until a full fresh bevel is formed when the teeth will get dull again. Then a second adjustment is required to again place them at such an angle that they will sharpen themselves. The object of this invention is to connect the teeth with the cultivator frame in such a manner that this adjustment may be readily made and also that an adjustment up and down may be had according to whether the teeth are working in hard or loose and sandy ground.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Oct. 22, 1891.

General trade continues fairly active, with the more distant and outlying points large buyers for winter custom. While complaints of trade being dull are still heard, yet it is the exception rather than the rule. The local money market is exceptionally easy for the season of the year. There is a larger reserve than for many years in this month. For the lack of something better, speculators are attracting attention to realty, with the view of getting up another land boom. They are encouraged by the lifeless character of all speculative securities and the increasing supply of money. Mail advices from New York report more funds seeking investment and a gradual shading in the rate of interest. The bank statement reflects the large gold imports. The increase in specie holdings is \$5,918,000, and the increase in surplus reserve \$3,536,000. The surplus is now \$6,639,000, as against \$3,155,000 one year ago and a deficit in 1889. A leading New York exchange says that in regard to prospects, several leading bankers agree in the belief that something like \$50,000,000 of the \$75,000,000 shipped since last spring will be returned. On the other hand, the purchase of American securities on foreign account has fallen off as well as the exports of cotton, at the same time that imports of merchandise are remarkably large. In the month of September there were brought to the port of New York \$39,385,181 of merchandise against \$48,876,281 for the corresponding month of last year, when goods had been ordered for the purpose of antedating the new tariff. Exclusive of specie, the entries have been larger than for the same month of any former year, except the last and the year 1882. Exports, however, show a still larger increase, the gains being upward of \$8,000,000. Exclusive of specie, the total is \$37,949,351, the largest for September known in the history of the port.

According to the New York *Financial Chronicle*, 140 lines of railroad, representing all parts of the country except New England, earned \$45,204,504, which is \$3,731,800 more than last year, showing an increase of nine per cent, and the comparison is with a month of very good earnings last year. The earnings were swelled mainly by the increased grain movement, which was simply enormous.

MEXICAN DOLLARS.—The market is quotable at around 77 cts. The steamer that left to-day for China took out \$203,337.

QUICKSILVER.—Receipts the past week aggregate 293 flasks, and the exports by sea, 19 flasks. The market is strong under a fair demand and better markets abroad.

SILVER.—The market is essentially unchanged. Leading Eastern financial papers estimate the year's output of the mines in this country to be larger than for several years past. The increase is said to be due to various causes, the chief being the successful working of lower grade ore. While bankers' conventions are declaring against the free coinage of silver, farmers and labor organizations are taking a more decided stand in its favor. The moneyed interests of this country, England and Germany have, for two years past, opposed silver, the money of the poor and middle classes, and also of farmers and producers in general.

BORAX.—There is nothing new to report. The market, which gave signs of strengthening, is slightly easier. Continued free shipments are being made eastward.

ANTIMONY.—Eastern advices confirm previous received information of a strong and higher market. Better prices at the East will stimulate production with us.

LEAD.—The market continues dull with an easier tone reported. Eastern advices report that holders were disappointed in their expectations of a better market under an active consumptive demand, and consequently, to stimulate purchases they made concessions.

TIN.—There is absolutely nothing new to report. *Iron Age*, in reporting the New York market, says: Managing the pig tin market seems to be a difficult job for those engaged in it, and forming a working idea of what the leaders are really up to is something that evidently mystifies the rank and file. At intervals when the surface appearances suggest a break, the market is given a little turn upward, and no sooner does sentiment turn than reaction takes place. The pendulations are not great, yet sufficient to keep the outsider in a state of uncertainty and cause consumers to buy cautiously. A London cable says: In tin plate there has been more business. Some good Russian and Frisco lines were booked. American buyers seem more inclined to business. Exports last month, 26,000 tons, of which 17,000 tons to the United States, against 35,000 tons and 25,000 tons respectively in September, 1890. Stocks at shipping points show large increase.

IRON.—Imports the past week aggregate 600 tons from Newcastle, England. The market for both spot and nearby is in favor of buyers. Oregon and Washington reports an increasing consumption, with a much larger increase in the year 1892. Eastern advices report a firm market, notwithstanding a large increase in the weekly output, being now over 181,000 tons against nearly 161,500 tons on January 1, 1891.

COPPER.—Exports the past week aggregate 280 tons copper matte to New York. The market has a lower tendency, due to the increased output in Chili and the near approach of the time for the Anaconda mine to start up. A London cable under date of October 14th says: Early in the week the copper market was depressed by rumors of reopening of the Anaconda mines and reported sale of Societe des Metaux works and stock. Later on prices

improved under the influence of purchase to cover "short" accounts and better buying on the part of consumers. There is still a feverish feeling, due to uncertainties regarding Anaconda and the French interests.

COKE.—Imports the past week aggregate 200 tons from London and 300 tons from Newcastle, England. The market is about as heretofore reported.

COAL.—Imports the past week aggregate as follows: Newcastle, N. S. W., 7029 tons; Departure Bay, 4750; Comox, 4500; Seattle, 2400; Tacoma, 4000; total, 22,677 tons. The market for spot and nearby is in buyers' favor, with concessions obtainable, but for shipment Australia is slightly higher, with English quite strong. The consumption in this State for steam and other purposes is the largest on record. Those in position to know affirm that the consumption throughout the winter months will not show any signs of falling off.

Mining Share Market.

Mining shares, the past week under review, met with a slight setback in both the Middle and North End shares, but the Gold Hill shares held fairly firm. The firmness of the latter, with the others shading off, looks very much as if they are being concentrated for an up move. Whether an advance in them will be based on developing work, or the usual assessment racket, there is a difference of opinion, which time alone can solve. Among well-informed miners and also usually well-informed operators, there are vague, mysterious hints of rich ore bodies that can be shown up by the managers of the Gold Hill mines when active work is begun on the levels that are being drained or pumped out. They claim that the late Wm. Sharon left the ore for future use. Many are inclined to doubt this report, for they claim that Mr. Sharon's life history while on the Comstock, is not such as to warrant the belief that he left anything that could have been taken. Be this as it may, as the water is lowered in the Gold Hill mines, their shares appreciate in value, and this, too, with the certainty that a line of assessment is to be levied before the close of the year. In outside mining shares there has been more doing in the Quijotas, Bodies and Tuscaraas, but quotations do not show an advance.

In last month this paper made mention that M. W. Fox, president of the West Con. Virginia Mining Co., had made application before Judge Rising, Virginia City, to order a survey of the west workings in the Con. Virginia mine. This application was made under the belief that the latter mine had taken out ore from the west ledge claimed by the former company. Owing to the Judge visiting this city, no decision was rendered until to-day. A telegram received from Virginia says: "Judge Rising dismissed M. W. Fox's application for a survey of the mine (Con. Virginia) on the ground that under the statutes the court has no jurisdiction to make an order of survey, unless suit is first brought." We understand that a suit will be brought at as early a day as possible.

Continued evidence crops out from time to time of the correctness of the MINING AND SCIENTIFIC PRESS's long contention that there is a well-defined lode west of the Comstock. The latest proof by direct work of a west lode is a confirmation of an improvement in one of the Silver Hill mines. The Virginia City paper in referring to the development says that 1000 feet south of the Daney mine, prospectors have encountered the continuation of the Daney ledge that was 30 feet wide at the 500 and 900 foot levels, but which was barren. At a depth of 65 feet on this new discovery it shows a width of 18 feet of reddish-brown quartz—gold-bearing. This ore assays about \$20 per ton, \$17 of which is gold. Water coming in at this depth, pumps will have to be erected before the prospectors can go deeper.

Yesterday (Wednesday) mining shares exhibited more strength under Con. Virginia's leadership, resulting in still higher prices on regular call this morning. The up move is generally considered a bluff on the part of the pool, so as to make a few shorts fill, after which bring Con. Virginia to \$4 or less.

'News from the Comstock mines continues as scarce here as hen's teeth, which is confirmatory of previous statements that the pool has succeeded in getting miners who know nothing (unless it is to the pool's interest) after they get out of the mines. Those in position to know are very sanguine of good results from running the west drift in Mexican, near the Opir line. In Sierra Nevada they ought to soon report an improvement, but perhaps the assessment on it and the one on Utah will keep back the work for a short time. The rich strike in Gould and Curry, made to the west by "Jim" Rule, was on the tunnel level. The ore is still there, although from another level ore has been extracted. It is thought by some that the Gould and Curry ore will be taken out by the Savage Co., and if so, they think that both companies will levy assessments to pay for the work, while a reported ring gets away with the bullion. In Hale and Norcross, new but very important work has been commenced. Savage reports the usual active and encouraging news from the work under way on the several levels. Is it not about time for the Potosi Company to show up the good milling ore reported some time ago, found on the 1100-foot level? But then perhaps another assessment may be required first. Bullion has good milling ore that can also be shown up. Information of a favorable character from the Ward shaft west workings is kept back. As it is nearly time to assess Con. Imperial and Confidence, there ought soon to be good news put afloat from that group. It can be, but hardly likely done on a legitimate showing. In Crown Point another strike is reported, but it is water as usual. The superintendent of that and the Yellow Jacket mine is a "lightning striker" for water, while the management is good at striking stockholders for assessments. The official news from the Gold Hill mines is of a very favorable character. It would not surprise the writer if one or more of the mines in this group should begin extracting ore by spring of 1892, that will return a handsome profit over and above all expenses. Important but secret work is reported in the Alta group.

Experienced miners are very confident that much better news will soon begin to come to hand from the mines in two of the outside districts.

MECHANICAL PROGRESS.

The Blacksmith and His Work.

The smith shop of a carriage manufactory is one of the most important departments of the industry, and one that requires as much skill in its way as any of the others. While it may seem an easy matter to heat iron and hammer it into the required shape, the trials of the blacksmith are equally as great in the successful treatment of his material as those of the worker in any of the other departments.

The proper degree of heat may not have been attained, which causes an unsuccessful weld; then, again, the iron may get too hot, fusing it and destroying its usefulness. The material itself may be faulty and uneven of texture; and then he must treat irons of different kinds, frequently varying greatly in quality and requiring altogether different manipulation. Again, he cannot be so exact and produce so finely executed a job as his brother wood-maker, who has altogether different materials to work upon and finer tools to use.

But we might continue the category of the difficulties the smith encounters in a countless number of details, until our readers were convinced that the hardest and most trying trade of the present day was that of a blacksmith; but such is not the fact, and if a blacksmith does have to endure some inconveniences, and his duties are laborious as a general thing, he receives as much, or more, than the worker at other portions of the carriage trade; and in regard to the arduousness of his labors, whether they seem hard to him depends upon himself, as what may be irksome to one, another may take pleasure in doing.

However laborious the work of a blacksmith may be, it is very much easier at the present day than in earlier times, when the brawny arm and the hammer were the potent elements in fashioning the rude iron-work, when the nails even were wrought out by hand (and who has not seen the curiously wrought hinges, door-handles and many articles of every-day use which are frequently seen in the highways even now). Then there were no cunning and powerful machines to lessen the labor of man and multiply his hands a hundredfold—the giant iron and steel rolling machines and their twin brothers, the huge iron and steel cutting machines that bite off the thick plates and bars as easily as one would cut a piece of cheese. These monsters, backed by an ever-lengthening retinue of assistants in the drop-hammers, whose weight is graded by the ton, and whose execution is only measured by the law of force; the trip-hammers, the younger members of the family, and the powerful steam dies and punches, and a countless number of lesser agents, all willing helpers of man, their master, now make the labor of the blacksmith very much easier.—*Amesbury Vehicle.*

Valuable Railroad Inventions.

What is pronounced by leading railroad men the most important invention during the last 25 years applied to the railroad business was recently exhibited for the first time at Indianapolis. It is a car scale, and is a simple piece of mechanism, which can be attached to any car, the weight of which and its contents is shown with perfect accuracy. The weighing of cars heretofore, when given any attention at all, has been chiefly a matter of guessing, and the consequent losses of the railroad companies from overloading have been enormous.

Another important invention in this direction is a new steel-tired wheel for railroad cars. The difficulty heretofore experienced of securing a tire capable of being placed in position without bolts has been overcome by this invention which not only does away with bolts but at the same time admits of a steel tire that will wear much thinner than those ordinarily in use. This result is obtained by means of a peculiar fastener, consisting simply of a notched plate that is placed between the tire and the wheel—the alternate projections on the plate being then bent into a groove in the tire, while the other projections are bent around the edge of the run of the wheel. By the adoption of this method perfect stability is given to the tire, and not only this, but it can be worn much thinner when thus fixed in position than by the old process of employing a simple flange for the same purpose.

Still another improvement, and one which is claimed to meet an important desideratum, is a self-registering signal—a device for preventing any mistake in interpreting a signal given on a gong, especially when five or six strokes are sounded. Ordinarily it is only by strict attention that an engineer is made sure of the exact signal given, and if confusion of any kind should cause him to lose count of the taps on the bell, no means are afforded him of verifying his understanding of the signal. The method which has been resorted to in avoiding this uncertainty is a mechanism by which each blow is clearly and distinctly registered; that is, upon the dial the index finger stands at zero until the signal is given, when each blow is recorded on the dial as struck, this registration remaining on the dial until changed, even if the person for whom the signal is intended be absent.

STEEL POWDER IN PLACE OF EMERY.—It is stated that steel powder is very well adapted for polishing stones, and that it can replace emery with advantage. It is obtained by

lightly sprinkling overheated steel with water. The metal then becomes friable, and is easily reducible to dust by stamping. The powder distinguishes itself from emery in that it is more keen and biting in its effects, and cheaper, while at the same time it leaves a finer and more durable polish.

Labor Saving Machinery.

Now that machinery does so much of the drudgery that has so long held men down, it calls for more active mind, and it gives an opportunity to some to spend many hours of each day in thinking of any subject. The result is either very good or very bad, and it depends on the man. If he lets his thoughts run loose it is only a question of time when his actions will bring disgrace to himself and those near to him, but, on the other hand, if he realizes the value of these spare moments for mental development he will surely make a success.

Some men have attained success and still been given to degrading habits, and these very ones are often held up as shining examples. But we should remember that there is a small chance of our being built right to do as they did; that these cases are exceptions to the rule; that greater results would have been attained if these men had devoted all their energies to the mind's development, and that degrading habits harm the senses, physical and moral, is an undisputed fact.

Just what branch of shop work each one should study is not easy to define, but the studious habit once acquired will surely work out all questions. It is not enough to be a good mechanic. If a man is nothing more than a good mechanic he is not the man for taking charge of work. If he is only an inventor he will never stand much chance of receiving any good return for his days and nights of study. Yet, it must be borne in mind that these days of study and thought are absolutely necessary in the successful man's life, but the study of mechanics must always be supplemented by a study of the field. If the aim is in the line of invention, patent laws must be studied, and the condition of the market must be known. If it is for fitting the mind for any opportunity that chance may offer, it is necessary to study thoroughly all the mechanical problems and shop ethics, taking each separately. It is foolish to say that we are so much the creatures of chance that we stand a small show of any good opening, and that all this close application of the mind to work is of no use; that preachers and successful men think that success comes solely from hard work, and that the successful "pat themselves on the back" when they think of it. Hard work is essential, but it will surely be foolish for anyone to let this kind of logic deter them from doing all that lies in their power for self development. For if they are unfitted, how will they be able to take advantage of an opportunity?—*Scientific Mechanist.*

WEIGHT OF MARINE MACHINERY.—Mr. C. H. Wingfield writes on the above important subject as follows: "In discussing a paper at a recent meeting in London of the Institution of Naval Architects, I pointed out that it is incorrect to assume that the whole weight of machinery in a ship varies as the horse power. More power may often be obtained from a given engine, shafting and propeller, by simply spinning them faster, without adding to their weight, and the weight of these parts, and perhaps of the shaft fittings also, varies as the revolution power (or horse power per revolution) much more nearly than as the indicated horse power simply. It is sufficiently correct, with a given type of machinery, to say that the remaining weights do vary nearly as the indicated horse power, and I suggested that a tabulated statement of weights would show more clearly how the weight per indicated horse power had been reduced in past years, if the weight of main engine, shafting, shaft fittings, and propellers were given separately from those weights which follow a different law, instead of 'lumping' all together under the name of 'engines' or 'machinery,' as has been done in every table of weights I have seen. If these are given separately, I see no objection to their weight per indicated horse power being stated, provided that the indicated horse power and revolutions are also given."

THE SEAMLESS BOAT, pressed out from an ingot of steel and shaped by hydraulic power, an English invention, is considered in England one of the latest triumphs of human ingenuity. It is claimed for these boats that they will last twice as long as wooden ones, that there is less danger of their capsizing, and that they are less liable to be affected by changes of climate. This method of producing a boat has already been mentioned in these columns, and is simply a larger application of the method which has long been used in this country for manufacturing cooking utensils and other articles of small dimensions.

SISKIYOU MINES.—The mining industries of Siskiyou county are now attracting a great deal of attention, both at home and abroad, and more good mines are being discovered right now, and more interest taken, than at any time since the "good old '50 days." Although the mineral of Siskiyou may not exceed that of many of the Southern counties, she is not hampered by any legal restrictions to render the best mines impracticable of working.—*Siskiyou Telegram.*

SCIENTIFIC PROGRESS.

Improved Astronomical Observations.

There are perhaps no observations in astronomy which require greater accuracy than those of star transits. Heretofore the dependence has been confined to the eye and ear. The eye must observe, the month transmit, and through the ear of a second person the record must be made; or the observer must watch the motion of the star and at the same time count the seconds by the ticking of the clock. Manifestly such a mode of observation must be attended with much inaccuracy, when the small fraction of a second is important. Personal equation must enter largely into the chances of error.

According to the New York Sun, a young Jesuit priest, Rev. Geo. A. Fargis, has just made an important improvement in astronomical methods of this class, by applying photography to the observation and thus compelling the star to make its own record of its transit. In measuring and determining the relative distances and positions of the heavenly bodies, it is absolutely necessary to ascertain with absolute precision the time of transit of a star across the meridian at which the observation is made.

Some years ago the chronograph was invented to remedy the errors of the ear. In this instrument an electric current recorded the time of the transit. The introduction of the chronograph did not do away with all errors, however. Scientific men said that if the star could be photographed, it would record its own transit.

Experiments were made to attain this end, but nothing practical was done until a few weeks ago. Under the direction of Rev. John G. Hagen, director of the Georgetown, D. C., College observatory, Fr. Fargis took a hand in the experiments. The instrument he has devised is very simple.

In a tiny camera, attached to the eye-piece of the transit instrument, a highly sensitive plate is inserted. Electric connection is made with a sidereal clock in such a manner that a narrow shutter or bar is moved up and down before the plate cutting off and admitting the light of the star at stated intervals during its passage across the field. The image of the spider line is afterward impressed upon the plate by the light of a lamp held for a few moments before the object glass of the telescope. By means of the shutter, or bar, this light is prevented from interfering with the star trail on the plate, which may be subjected at any time to repeated examinations and measurements with a microscope. The registry of the transit is said to be so accurate that the time can be determined within the one-thousandth part of a second. Fr. Fargis has used his device in observing several hundred transits. His contrivance, it is said, may be applied with accuracy to many other purposes in astronomical work. The Smithsonian Institution has printed an account of Fr. Fargis' invention.

A NEW PYROMETER for which special claims are made owes its origin to Professor Roberts-Austen. It is notorious that two different metals in contact produce a current of electricity when the junction is heated, and this current increases in strength in proportion to the temperature of the junction. It follows that the current sent through a galvanometer becomes a measure of the temperature of the junction. If such a junction is put in a hot place, say the furnace, and connected by wires to a galvanometer at a distance, the temperature of the furnace can be read off the scale, or, as has been done in the new instrument, recorded on a band of photographic paper by a beam of light reflected from the needle of the galvanometer. Prof. Roberts-Austen employs platinum for one metal and an alloy of platinum, with 10 per cent of sodium, for the other. With this combination he can measure temperature up to the melting point of platinum.

THE GREEN RAY.—C. Mostyn, in a letter to Nature on the well-known appearance of the green ray at sunrise or sunset, caused by the refraction of air, states: "This 'green ray' is seen to best advantage at sunrises, owing, I imagine, to the eye not being wearied with watching the previous glare, as is apt to be the case at sunset. At the same time, I had many very satisfactory observations at sunset, one in particular, when we were running before a very heavy sea in the Southern ocean, and the green ray was seen no less than three times in as many seconds, as the ship rose and fell on the huge waves, causing as it were two sunsets, with a sunrise between them. The heat displays took place when the refraction near the horizon was of such a character that the sun assumed a halo or vase shape, as it came close to the sea line. When, on the contrary, the sun appeared flattened out in its horizontal diameter, the green ray was either entirely absent, or was seen only in an indistinct and uncertain manner."

EARS IN THEIR LEGS.—Science and the microscope sometimes make most unexpected revelations. Who that has heard the chirping of a cricket or the ear-splitting noise made by a tiny cicada and noticed the instant cessation of sound on the near approach of any moving body, can have any doubt but that such insects have ears whereby they may enjoy their

own music or detect the approach of danger? Yet for years naturalists were unable to detect any organ of hearing in their anatomy. True, a bright oval spot was noticed upon the fore-legs of crickets and a similar spot on the tibia of grasshoppers, but until Sir John Lubbock and other modern naturalists made a close study of the matter by aid of improved microscopes no one suspected that those little spots consisted of anything like an organ of hearing, especially as they were in such an out-of-the-way place for such an organ. But science is what and when we find it, and it has proven that crickets, bees, ants and most others, even of the most tiny specimens of the insect family, have ears and other sense-organs as well. The most hidden secrets of nature are fast being discovered and laid open to the world by the astute and plodding scientists.

ELECTRICITY DIRECTLY FROM HEAT.—The great desideratum of converting heat directly into electricity, or obtaining electricity from coal without the introduction of steam, will no doubt soon be reached. The solution of that problem is the philosopher's stone which just now all are seeking, and great will be the rejoicing when it is reached. Its discovery will work the greatest revolution in human industry which the world has yet met with. Every little advance in that direction is watched with the most intense interest. The conversion of the thermic energy combustion direct into electrical energy is already an accomplished fact, and recent investigations in that direction give some reason to believe that may be the path which will lead to success. The recent experiments of Dr. Girard, in France, in regard to such transformation seems to indicate quite a step in advance, as it is said they have already resulted in the construction of a stove, which may possibly, when perfected, effect a complete revolution in our present mode of heating dwellings and railroad cars.

UTILIZATION OF WASTE PRODUCTS.—The strides that are being made in the utilization of waste products, remarks the *Pall Mall Gazette*, gives hopes that soon the term, waste, will become a misnomer. The latest that we have heard of in this direction is the collection and utilization of the carbonic acid gas given off at breweries and distilleries during the process of fermentation. The quantities that are developed and at present allowed to run to waste are enormous, one estimate putting the annual production in the United Kingdom at 300,000 tons. It is at the same time a product of considerable value, and is extensively used in the manufacture of aerated waters, ice and other articles. By the process which has been patented the gas is collected, purified, liquefied and stored in iron bottles for commercial use at a very small cost. It has been in successful operation for some time in a large distillery in Dublin.

SUSPENDED MATTER IN FLAME.—The presence of suspended matter in flame, says *Invention*, has just been demonstrated by Professor Stokes. The way this is optically proved is to condense sunlight on the flame. The light is then scattered by the solid particles in an extremely thin layer, both where the beam enters the flame and where it leaves it. It is polarized in the flame of reflection; yet this effect is not found in all flames. It is absent, for instance, in that of a Bunsen flame lit with burning sodium. In the latter case, this seems to be due to the fact that the sodium is in the form of vapor—not of solid particles.

ROOTS OF A PLANT AS A FORCE PUMP.—The remarkable power exerted by the roots of a plant in forcing liquid up the stem was demonstrated in an interesting manner with apparatus at a recent meeting of the Royal Society in London. A stem about five-eighths of an inch in diameter was cut off at a height of four or five inches and joined by rubber connections to a fine glass tube about ten feet high. Early in the day this tube was filled to a height of a few inches with a colored liquid, but by evening the fluid had been forced to a height of about nine feet.

A GREAT MINING TUNNEL.—A gigantic tunnel, which is estimated to cost \$750,000 and require ten years to finish, is being constructed in the Leadville mining district, for the purpose of draining the mines. It will be at least five miles long, and will, when completed, leave to easy access millions of tons of good ore that cannot now be gotten at and probably never can be handled without the use of proper drainage.

POWER OF SMALL MAGNETS.—Sir Isaac Newton is said to have carried in his ring a magnet weighing but three grains, which could raise 746 grains or 250 times its own weight. This magnet naturally excited much admiration, but is surpassed in power by that formerly belonging to Sir John Leslie, and now in the Physical Collection at Edinburgh, weighing 3½ grains, and having a carrying power of 1560 grains.

THE LUMINOSITY OF ARC LAMPS.—Prof. Elton Thomson corrects the popular impression that luminosity of arc lamps is due to heated carbon particles. He says that, although there is a steady stream of carbon vapor between the carbons, yet the light is nearly all derived from the enormously heated surfaces from which the evaporation takes place.

ELECTRICITY.

A NEW TELEPHONE.—Something of an excitement has been created during the past three weeks in regard to the announcement of the invention of a telephone entirely novel in character, and for which wonderful advantages are claimed. The inventor is James A. Christy, a citizen of California, and his hanker is said to be E. J. Baldwin of this city. With them, according to reports, are associated such eminent capitalists as Jay Gould, John W. Mackay and J. B. Haggin. It is claimed that Mr. Christy has been several years at work upon the invention, which is so sensitive that the faintest whisper or the slightest rustle of wind can be transmitted thousands of miles. The patents for this wonderful instrument are practically all secured, and the work of manufacture and putting to use will soon begin. Baldwin is ready with his millions to put the inventor on the pinnacle of fame. In regard to the expense and mode of using this new instrument, Mr. Christy says the customer will simply have to drop a nickel in a box a foot square attached to the wall, make his own connection with the person or office he desired to reach, and talk until he was tired. No central office would have to be run up, and there would be no trouble at the switchboard because some one else was in the way. It is this central switchboard, which Mr. Christy has also invented and patented, that helps to make this instrument so practical. It is claimed that the originality of the invention is of such a pronounced nature that there is no danger of litigation on account of infringement. It is to be hoped that the story may be nothing less than it is represented to be; but the public will have more confidence in it after all these claims are substantiated by their practical application.

AN ELECTRIC LOO for measuring the speed of vessels at sea has recently been invented, and is just now attracting much attention from nautical men. The logs heretofore in use are known to be very unreliable. They all have a tendency to rise as the speed is increased, until at last they jump from sea to sea, and do not register the speed made by the vessel. To overcome this defect has been the object of the invention herein alluded to. It has been thoroughly tested by cruises about Boston bay, and by a trip on the Old Dominion boat to Norfolk. The result of the last trip, says the *Boston Transcript*, was so satisfactory that the owners of the log were persuaded to seek authorities in Washington, and have a trial made on one of the Government vessels which would steam 20 knots or over. The log was carried to Washington, and was found to contain so many useful ideas that it was decided to order a trial of it on a vessel of high speed. Rear Admiral Walker has been directed to appoint a board of officers, and have either the *Venus* or the *Cushing* used for the purpose. It is presumed that the *Venus* is to be the vessel selected for the trial, and that it was for this reason she was sent to the Brooklyn Navy Yard to be docked and cleaned for her work.

A NOVEL FORM OF ELECTRIC BELL, in which the vibrations are maintained, not by hammering, but by means of synchronically intermittent electro-magnetic attractions, has been invented. The bell or gong itself, which is made of steel, carries upon its outer edge a very small plate of platinum; and this plate, when the apparatus is at rest, just touches another platinum contact, which is attached to a fixed spring. Within the bell, and almost touching its edge, is a short, fixed electro-magnet, and this is put into electrical circuit with the platinum contact pieces. When the current is passed, the steel bell will be successfully attracted and released with great rapidity. The amplitude of its vibrations depends upon the strength of the current and upon the adjustment of the spring contact. By means of this device the disagreeable clashing of the ordinary electric hammer is replaced by a pure musical note. When the bell is mounted in a resonant box, it can be heard distinctly from a long distance.

AN ELECTRICAL REGULATING SWITCH, by which the consumption of electricity can be regulated at will, is one of the recent and most useful electrical inventions. By means of this device, a 16 candle power lamp can be so regulated as to produce a light all the way from 16 to one-half candle power. The fact that the size of the light and the consumption of electricity could not be controlled without changing lamps, and the consequent greater expense than perhaps was necessary at all times, has kept many from introducing electricity into their houses. A device of a similar character, if not the very same, will be applied to regulate the consumption of electricity according to the actual needs on the electrical road now in course of construction in this city. A device of this kind is just what is needed to render the use of electricity of more general and economic use.

AN ELECTRICAL APPARATUS FOR THE TREATMENT OF DEAFNESS.—An electrical apparatus for the treatment of deafness has been invented by George F. Webb of Jefferson, Ohio. It comprises a battery, a belt, an electrode supported upon the belt, and shaped to rest upon the ear, and having an opening on one side to receive the ear, and connections between the electrode and the battery. An efficient and

simple device is thus provided for constant use to remove the source of deafness, one which may be safely applied, and is designed, while serving as a remedy, to enable the patient to hear distinctly.

AN ELECTRICAL STOP WATCH, which will register hundredths of a second, has been invented which is said to have been already most satisfactorily tested. At a recent trial, it determined which was ahead on the trial of two bicycles in which the winner won the prize by only a one-hundredth part of a second. One machine ran a hundred yards in 10.4-100 of a second; the other in 10.3-100. In a 220-yard contest the same two machines made such the run in exactly 23.97-100 seconds. The human mind is utterly unable to time so closely. A man holding a watch must observe the starter's pistol, press the button, and at the finish, watch for the supreme moment and record the time without anticipating or delaying the instant at the finish.

AN ELECTRICAL MUSICAL INSTRUMENT has been devised by a Frenchman. He calls it a "palliphone." It is made up of a series of bells of different tones. Each bell is placed between an electro-magnet and an interrupter, and the bell itself thus becomes the medium of the electric current. The sounds produced are said to resemble those of an organ.

AN ELECTRIC LIGHT FOR A CANE has been devised for the use of physicians, reporters and others at night. The light is supplied by a small storage battery in the head of the cane. It will be found convenient for seeing the door number and for many other purposes for which a lantern would otherwise be needed.

Pacific Coast Electric News.

The power houses of the North Beach & Mission electric road of this city will be situated on the southwest corner of Fourth and Louisa streets, the site of the company's present stables, and a large carhouse will be erected on a block of land owned by the company at Folson and Twenty-eighth streets. Construction will soon be commenced on Folson street, at California avenue. The money for the construction of this road will be raised by the issue of \$1,000,000 worth of bonds. The line will run by the present route from the ferry to Precita avenue.

San Francisco capitalists have in contemplation the construction of an electric road from the tide-water landing at Napa to Calistoga, a distance of 28 miles. It is proposed to commence the construction of this road early in the spring if the proper preliminaries can be completed by that time. The road will be used for freight as well as for passenger service, and it is expected to start one or more cars every hour during the business portion of the day. Passenger fare will be one cent per mile, and freight at a material reduction from present rates. So says the *Napa Exchange*.

Electrical Railroad Through the San Gabriel Valley.

The *Ontario Observer* predicts that an electric railroad will soon be constructed along the foothills on the north side of the San Gabriel valley, from Los Angeles to San Bernardino. Such a road, it is claimed, could be operated for one-half the cost of operating either of the two steam railroads now running through that valley, for the reason that all the electrical power needed could be obtained from water now running to waste at different points along the proposed route. For economic transportation of passengers and freight, the electric system, when furnished with cheap water power, has no competitor, and with such inexpensive power at its command, the road proposed could, at one half the rates now obtaining, earn its stockholders greater dividends than are being earned by the two steam railroads now running between Los Angeles and San Bernardino.

Electrical Railroad Possibilities.

The possibilities of railroad transportation along all the foothill regions from Shasta to San Diego are beyond computation. The cheapest water power might be utilized throughout that whole distance—a power which, under such conditions, might bid defiance to any competition from steam. The cost of construction of such roads would also be far less than the cost for steam roads, which have to sustain the concentrated weight and hammering of the high locomotives inseparable from the operation of steam roads. The 2500 miles of electric railroad now in operation in this country and Europe have all been built since 1885. The construction and operation of such roads, for through business of all kinds, has now fully passed the experimental stage, and such construction has but just begun. Who can predict the future, in view of the rapid improvements that are now being made in the way of generating, storing and transmitting electrical power?

THE WHATCOM ELECTRIC ROAD.—The people of Whatcom (Washington) are looking forward to the completion of the Lake Whatcom electric road, which it is expected will be running about the first of January. The Thomson-Houston electric system will be used. The power will be supplied by two steam engines of 150-horse power each.

The weight of the average lead-storage battery is about 100 pounds per horse-power hour.

A battery to run six hours should be charged 10 or 12 hours. Under the most favorable conditions, says *Practical Electricity*, 80 per cent of the current used in charging can be recovered in its performance.

The first electric road in Brazil will be built at Bahia, where a narrow road $1\frac{1}{2}$ miles in length is under construction.

ENGINEERING NOTES.

CANADA'S WATERWAYS.—The Dominion Government is spending many millions of money in enlarging and improving its facilities for transmitting shipping around the obstruction between the Great lakes and on the St. Lawrence river. This enlargement has already reached the enormous sum of \$26,000,000, in addition to the original cost, \$15,000,000. It is furthermore estimated that about \$15,000,000 more will be required to finish the work now in progress. When these improvements are completed, the largest commercial vessels will have free passage from the mouth of the St. Lawrence into Lake Superior. Of course no one believes that all this money is being expended for commercial purposes alone. These improvements are all on British soil, and fortifications are already beginning to appear at strategic points along the route. By our treaties with Great Britain, no war vessels are allowed in the lakes under either flag; but England is preparing the way whereby they may be placed there in a few days after any war might break out. All this time the United States is quietly looking on and doing nothing. Is it good policy? We have a ready access to Lake Michigan, which might be made available for both war and commercial purposes by expending only a limited amount of money on a natural waterway from the Mississippi to the lake. An addition to that amount, far less than that being spent by Great Britain, would make full connection with all the lakes entirely upon our own soil. Such improvements would be worth far more than their cost for commercial purposes alone. An agitation in that direction should be set on foot by the people, in order to force action by Congress.

THE ROMANS AS ENGINEERS.—The Romans were the first great engineers, and in their own particular manner have never been excelled. Their genius was more of an engineering quality than architectural, and it is in this department they erected their most successful structures. Architecturally, though of wonderful variety and imposing magnitude, Roman art was rich, too great a combination of diverse elements to be thoroughly artistic and in keeping with refined taste. The barbaric Etruscan element in the Roman character which found visible expression in their gladiatorial and bloody shows, was too strongly rooted to be eradicated even in the centuries of independent Roman existence. The many lands which Roman conquerors placed under their city's sway made them familiar with a great variety of architectural forms they did not hesitate to avail themselves of, and the result was a combination, wonderfully rich and impressive, but often violating the canons of architectural art. Measured by the faultless standard of the Greek, its immediate predecessor and the model it most closely followed, Roman art leaves much to be desired from the æsthetic standpoint. But however unsatisfactory the Romans were in architectural design, and it must not be forgotten that after all it is the parlor which chiefly finds fault with them, they more than made up, as constructive builders. Construction was the Romans' chief point of excellence, and they brought to this work a native genius and an insight into engineering requirements of a very high order. —*Engineering Magazine*.

THE POWER LOST IN A JACKSCREW is immense when set up in haste, without any regard as to how the strain may come. It is necessary that there should be 50 per cent in friction to keep a jackscrew from running backwards, and the pitch of the screw is generally such that the jack will remain wherever it may be turned; but when blocked up under one edge, instead of having a bearing on all sides it takes nearly as much to turn the screw one way as the other, and if the oap piece has not been dished out on a true circle what little power that remains may be taken up from this source; and no wonder that the hydraulic machines take the lead where nearly every ounce of force is made use of.

THE PRINCE EDWARD ISLAND TUNNEL.—The Canadian Government has had under consideration for a long time the construction of a tunnel under the Straits of Northumberland, which will connect Prince Edward Island and New Brunswick. A report recently made to the government shows that the work is feasible, and that the cost for a tunnel that will accommodate all kinds of cars will not exceed \$12,000,000. The distance from shore to shore is about 13,500 yards, and the whole tunnelling required, including the approaches, would be about nine miles.

INCREASING USE OF PETROLEUM FOR FUEL.—The use of crude petroleum for fuel is constantly extending. It is said that 15,000 barrels, equal to 40,000 tons of coal, are consumed daily in Chicago. It is now used in 18 States.

GOOD HEALTH.

INTOXICATION FROM SUGAR FUMES.—It is mentioned as a very curious fact that the gases arising from sugar that has been stored in the hold of a vessel without ventilation will produce a state of intoxication. This saccharine "jag" is caused by merely breathing the air where the sugar has been stored, and while 20 minutes in the open air is sufficient to work off its effects, it is none the less a "jag." While the barkentine John Swan was unloading a cargo of sugar at Pier 30, in Philadelphia, says the *Record* of that city, it was noticed that quite a number of the stevedores, working in the hold of the vessel, were acting in a strange manner, as though under the influence of liquor. They were induced to go on deck, apparently in a healthy state of intoxication, but after a few minutes in the open air they recovered and continued their work. John Daffy, one of the men affected, pronounced the sensation to be exactly similar to effects produced by drinking whiskey. For a while he felt stimulated, then began to grow exultant and hilarious. Shortly after that he began to get dizzy and stagger, and finally lost all control of his mental and physical faculties, when he was removed to the open air, and recovered shortly afterward. The effects of the fumes have only been noticed early in the mornings, when the hatches are first removed. Gradually the current of air from the two hatches dissipates the gas, and within an hour it disappears entirely, leaving only a disagreeable and penetrating odor and a sediment which penetrates every part of the vessel.

HEALTH OF THE STATE.—The State Board of Health report for September contains mortality reports from 63 cities, towns, villages and localities, having an aggregate population of 675,551, show the total number of deaths from all causes in September to have been 929, making a death rate per thousand of 16.44 per annum. Consumption was the cause of death in 129 cases, pneumonia in 38, bronchitis in 13, congestion of the lungs in 3, diarrhoea and dysentery in 30, cholera infantum in 30, other diseases of the stomach and bowels, 63, diphtheria, 33, membranous croup 10, whooping cough 6, typhoid fever 20, malarial fevers 7, cerebro-spinal fever 3, cancer 20, erysipelas 3, heart diseases 73, alcoholism 8, and from all other causes 444. The prevailing diseases, as reported from 55 localities, give 30 cases of cholera infantum, 168 of diarrhoea, 47 cholera morbus; 41 dysentery, 29 measles, 26 diphtheria, 31 whooping cough, 39 typhoid fever, 379 malarial fevers, 62 bronchitis, 42 influenza, 5 rheumatism, and 62 other diseases.

TARTAR ON THE TEETH.—Dentists have discovered that tartar, a calcareous deposit on the teeth, is more abundant in persons of highly nervous temperament than in any others. The explanation, according to an observant dentist, is that persons of nervous temperament secrete more saliva than others, and as tartar is carried by saliva in solution, the deposit in the case of such persons is unusually large. It is a well-known fact that the nervous condition has a marked effect upon the salivary gland. An Oriental method of detecting crime is to take several persons suspected of offense and require them to chew dry wheat. The nervous fears of the guilty man seals up his salivary glands and he chokes in attempting to reduce the grain to pulp.

GAMY MEATS NOT HEALTHFUL.—There are many people who prefer "Gamy" meats, or, in other words, meats that are a little over the line of decomposition; nor are they ready to accept the fact, long ago established, that such meats are not only unfit food, but are in a high degree harmful. When decomposition occurs, poisons are developed. Healthy adults are able to resist these poisons to a trifling extent. Just where this resistance lies no one knows, but it is generally accepted that it is in the liver. This theory is supported by the fact that those who are inclined to be bilious and have sluggish and otherwise deranged livers are always upset, if not made really ill, by meats or fish that have become in the slightest degree tainted.

IT IS THE LITTLE THINGS OF LIFE that tax one's nerves the most, as a stalwart youth of Kansas found when he accepted a wager that he could not stand a quart of water dropped into his open hand drop by drop from a height of three feet. Before 500 drops had fallen into his hand he almost cried with pain and said he had enough. After a little water had fallen, each drop seemed to crush his hand, and a blister in the center of it was the result.

ELECTRICITY AS A CURE FOR TIPPING.—An exchange says that fashionable men in Paris and London are now using electricity as a cure for excessive tipping.

THE CAPE COD CANAL has got another setback. A Canadian syndicate recently proposed to undertake its construction; but have lost their right on failing to make a deposit of \$500,000 before Sept. 9th, to secure their charter. Report has it that the old original company will once more resume its construction; but to do so, this company will be obliged to make a deposit of \$100,000 on or before November 1st. It is greatly to be regretted that failure to secure capital should keep back the construction of this important work.

Passing Events.

The opening of the belt line railroad along our city front this week marks an era of great progress. Ship and car are brought together, and goods may be landed close to the warehouse without any long-distance teaming as formerly. In time the belt road will be extended completely along the city front.

Grass Valley expects before very long to have electricity furnished it for power, the original source being in the South Yuba river. Many mines which cannot get water-power, owing to their location, could be supplied with electrical power for their machinery.

The formation of a Traffic Association by the merchants and shippers of San Francisco has been accomplished, and much good to our commercial interests is expected to result. The committee is now at work on the details of the plan.

In the death of Joshua Hendy this week, San Francisco loses not only a pioneer foundryman, but one who was a pioneer in introducing and manufacturing several important mining appliances now in very general use.

Will no Longer Contest the Issue on the Old Lines.

The controversy between the enjoined hydraulic miners and their opponents has been a long and bitter one, having for a period of 15 years been carried on with much acrimony on both sides. When, at last, a commission was appointed to effect, if possible, an adjustment of the differences between these parties, each affected to be pleased with the arrangement, professing a willingness to abide by the finding of such commission, whatever it might be.

And now that the members of this commission, consisting of three officers chosen from the Engineering Corps of the U. S. Army, have completed their task and made their report, it must, in justice to the parties to this contention, be admitted that, as a general thing, they have expressed themselves satisfied with the conclusions reached by the commission; and yet, owing to certain events that have intervened, these conclusions are likely to prove nugatory and of no effect.

Anticipating the finding of the commission, which was to the effect that the miners might, in most cases, be safely permitted to resume work after having built suitable dams for impounding the mining debris, the Liberty Hill Hydraulic Mining Company had proceeded to build on Bear river a structure of this kind, in the expectation that they would not afterward be molested. But in this they were disappointed, having been enjoined soon after they recommenced gravel washing, the reason assigned by the court for such procedure being that the dam so erected was not only insufficient for the purpose intended, but that it was dangerous as well, being liable to give way and destroy the lives and property of persons living along the river below.

As this dam had been built with care and after the style most approved by competent engineers, the enjoined miners have come to the conclusion that they cannot safely incur the expense of building dams of this kind preliminary to resuming work on their claims so long as they are exposed to the liability of being enjoined by these local courts. Until such time as they can have the question of the sufficiency and safety of these structures determined by some more competent authority they have about made up their minds to let matters rest as they are. It may, in this connection, be proper to observe that the Bear river dam above mentioned, has not only well answered the purpose for which it was intended, having caught and retained all the debris coming down that stream, but it has withstood without the slightest impairment the winter floods occurring since its construction, some of these floods having been of unusual severity. It is argued by the miners, therefore, that it would be very unwise for them to erect any more of these retaining dams with such precedent before them.

Unless, then, some plan can be devised, whereby these men can be insured more adequate protection against this class of judicial proceedings the findings of this Commission, so largely acceptable to a majority of both the farmers and the miners, will prove of little avail, if not wholly futile and inoperative. That Congress, cooperating perhaps with our State Legislature, will be able to devise some such plan may reasonably be expected. Only through legislation can anything further be done, matters, so far as the miners are concerned, having come to a dead halt. They do not contemplate farther movements, either offensive or defensive. Their association has been disbanded, they have no common fund, and all concerted action has come to an end; and, at least, we are credibly informed is the case. Nor under the circumstances, can we see what additional step these miners can take.

They cannot resume gravel washing without taking care of their tailings, a thing impracticable without the construction of costly dams, and these they do not feel that they can afford to build with so little chance of their being approved by the powers that be. The alternative of giving up the business is a desperate one, too much so to be adopted by any but a thoroughly venturesome man.

While the public knows something of the long warfare waged between the hydraulic miners and the farmers, it knows little of the many make-shifts to which the former have resorted in the hope of being able to realize some small

earnings without injuring any other interest or calling. To accomplish this end, they have built retaining dams, with the result stated. They have had recourse to the hydraulic elevator, depositing their tellings in the old gravel pits, and also to the drift process, neither of which having been attended with much success they are now about to try the experiment of giving up work altogether, or at least suspending it till such time as it can be carried on without being constantly interrupted by legal proceedings. Until the business can be placed on some such basis it is not probable that any of the larger hydraulic companies will ever again run or attempt to run a giant in their mines. Certain it is they will not longer undertake to fight this issue on the old lines.

There is one thing certain, the gold that used to come from these mines is very badly misused in this State; and while, during the height of the debris controversy, when bitter partisans were advocating their respective sides, the general feeling was against the miners, and in the end they were defeated, now there is a change apparent. People are more lenient and less prejudiced than they were. They would like to see some means adopted by which the miners could work, provided they did no injury to others with their debris. The first public indication of this was in the message of the present Governor of the State, in which the mining interest was favorably spoken of and the suggestion made that the Legislature ask Congress to supply some remedy to the existing conditions. More recently, the Sacramento Supervisors visited the Iowa Hill mines and had a conference with the miners relative to permitting them to do certain work; and only last week at the session of the Bankers' Association, in this city, the president suggested it was a question of the first importance as to how to increase the gold output of the State without injuring any citizen's property.

There is doubtless the same opposition to the miners injuring the rivers and harbors that there always was; but there is also a feeling that the dams should be given a thorough trial, and if they fail to hold back the debris, the engineering profession should be called upon to solve the problem, so that the mines can be worked. A few fanatics there are, of course, who can see no way to let the miners work, and want to see no way. But the great mass of the people are tired of the controversial feature and would like to see the problem left in the hands of professional engineers, in the hope that a method may be devised by which the mines can be worked without injury to rivers or lands.

What might now be done would be for the General Government to build a number of the dams, their sites to be selected and their construction supervised by an agent of the Government. Should these dams answer the purpose intended, then the miners might be required to go on and erect such additional number thereof as seemed necessary, the Government agent designating their localities and also looking after their construction. With an arrangement of this kind the miners would be satisfied and this vexatious question be permanently disposed of, to the relief of the general public as well as of the parties more directly interested in its settlement.

A MINING CONGRESS.—The object of the National Mining Congress, to meet at Denver, Colo., November 18th, 19th and 20th, is to organize and adopt measures to regulate the production and distribution of the mining product of the United States. The affair is in charge of an Executive Committee consisting of Chas. E. Taylor, D. H. Moffat, N. P. Hill, H. A. W. Tabor, Dennis Sheedy and M. J. McNamara. Secretary Caretaphen states that the appointment adopted by the Executive Committee gives each State ten delegates, to be appointed by the Governor, each town one at large, one for the first 2500 population, and one for each additional 10,000 population, one for each mining stock exchange, and one for each ten members thereof. The Executive Committee will appoint 50 delegates for the country at large. The Congress is to be held at the Denver Mining Exchange.

The works at Keeler, Inyo county, are turning out two or three carloads of soda daily. It is rumored that an English company has purchased the works and locations.

The Late Joshua Hendy.

Joshua Hendy, manager of the Joshua Hendy Machine Works, died in this city on Wednesday, in his 74th year. Mr. Hendy was well known to the mining community all over this coast as a manufacturer of ore-feeders, concentrators, hydraulic nozzles and hydraulic elevators.

Mr. Hendy came to the United States from England in 1836, and lived for a long time in Louisiana and Texas. He arrived in California on the steamship Oregon Sept. 19, 1849. He first went to work in an open-air boiler shop, where Leideedoff street now is. By chance he learned that three portable saw-mills were to be sold, and these he bought and placed in operation in different parts of the State. He took one himself to Sonoma county, where he joined forces with the Duncan Bros. and started what eventually became Duncan's Mills. He then went to Placer county in the sawmill business. After some time he returned to San Francisco, where he commenced to manufacture sawmill machinery, a specialty he conducted up to the time of his death.

In addition to sawmill work at his shop, he began to manufacture automatic ore-feeders. It was at first up-bill work introducing these machines into the quartz-mills, but he persisted and the opposition was finally conquered. He bought up several patents and soon had practical control of the ore-feeder business, and has kept it ever since. He made the Triumph, Stanford, Improved, Hendy Challenge and others. This branch of his business was very profitable indeed.

In ore concentrators he was also a pioneer, and some thousands of the Hendy ore concentrators were put in use until the belt machines supplanted the original form. Then he became owner of the Triumph concentrator, a form of belt machine of which many have been sold.

He was also sole manufacturer, under letters patent, of the hydraulic giant known as the Fisher double-jointed.

He was the first one to manufacture the hydraulic gravel elevators, now so largely used. The mining engineers did not believe these machines were practical, but Mr. Hendy did. They have been found to accomplish the purpose of raising earth, sand, gravel, etc., from shallow deposits, and working low ground where there was no "fall." To prove their value, Mr. Hendy bought the Yreka Creek gold mining property, in Siskiyou county, built an elevator and put it at work. This venture is said to have cost him some \$70,000, because the ground did not pay. The machine, however, was a success, and he has since continued to make and send them all over the world.

In September, 1882, Mr. Hendy formed his business into a corporation designated the Joshua Hendy Machine Works, of which he was manager, and his nephew, Samuel J. Hendy, is president. The scope and extent of the business has been largely increased, and while continuing to deal, perhaps on a greater scale, in second-hand machinery, they have extended their facilities for manufacturing new, of any required form or design, and to furnish any character of plant for any mechanical requirements.

The works are agents for a number of things, engines, boilers, pumps, blowers, tools, etc. They also built quartz-mills and equipped gravel claims with gold-saving appliances.

Mr. Hendy has not taken so active a part in business in the past few years as formerly. He was a very energetic man, pushing and persistent. In connection with the ore-feeder business, and that of the hydraulic elevators and concentrators, he had many a controversy and hard-fought battle. He was a peculiar man in many ways, and a successful one. He was among the pioneers of the foundrymen of this city and State, and built up a good and steady business in many branches.

THE GILMAN STRIKE.—A Seattle dispatch of the 19th says: The strike in the Gilman coal mines, which was inaugurated last March, was declared off yesterday at a meeting of the strikers. The company has announced that all the men who gave satisfaction before the strike will be taken back. The agitators, however, will be barred.

YREKA, Siskiyou county, is now lighted by electricity.

The Con. California and Virginia.

The famous bonanza mining company—the Con. California and Virginia—held its annual meeting on Monday.

Supt. Lyman's report is a lengthy document. The main points of interest in the mine during the past year were the 1100, 1500, 1750 and 1800 levels.

A summary of the superintendent's statement of the bullion extraction during the year shows that in all 86,443½ tons of ore were worked at the Morgan and Eureka mills. The total value of the bullion produced was \$1,752,776.03, of which \$929,922.34 was in gold and \$822,853.69 in silver. The average yield of bullion per ton was \$20.23, of which \$9.58 was in gold and \$10.65 in silver. The total assay value of the ore per ton was \$26.04.

The secretary's financial statement showed a cash balance on hand of \$98,000.

Operations in the mine from the 1500 level upward are carried on through the Con. Virginia shaft, and all operations from the 1600 downward carried on through the C. & C. shaft. Both shafts and the machinery connected therewith are in good working condition.

The gross product of the mine for the past fiscal year was valued at \$1,752,776.03. After paying two dividends of 50 cents each, the total of which was \$216,000, and all the expenses of the year, the company has a cash balance on hand of \$98,000.

The old directors were unanimously re-elected, consisting of C. H. Fish, H. B. Havens, W.

The Belt Line Railroad.

The belt line railroad on the sea-wall of the harbor front began operations this week, and the first trains were brought to the freight-sheds. Only a portion of the entire system is complete, and that on the northern sections of the sea-wall. The belt line extends along the

Pacific, have been built on lots bounded by Front, Davis, Vallejo and Green streets, while a big coal platform stands along Davis street, extending from Vallejo to Broadway.

An immense train of heavily loaded freight-cars was shunted on to the new track from the steamer Ukiab, the locomotive "Governor Markham" doing the work, and the cars were moved over the entire line of road-bed.

The belt line is under the control of the Harbor Commission, and the road may be used by any one by securing a side-track for his private use, to stand cars upon while loading and unloading.

The object of the system is to afford manufacturers and shippers easy and rapid facilities for direct connection by rail and ferry with the railroads centering across the bay. It will no longer be necessary to use teams for freight from the extreme southern end of the city, where the railroad depot is. The cars are brought in the ferry-boat, and the freight can be discharged near the large warehouses of the city.

AN ORE-FINDER.—A Denver, Colo., dispatch to the St. Louis Republic says: There is another craze in Colorado over a patent a man claims to have by which

from Los Gatos to Oakland will be 85 cents. The present rate is \$1.60.

The Triplex Electric Pump.

(Continued from page 261.)

The combination which has met with such success in the applications mentioned above and which is handled by the Thompson-Houston Motor Company for ordinary pumping work, and specially fitted for mining work by the Thomson-Van Duzee Electric Mining Co. for all mining, excavating and metallurgical operations. Information on the subject of the applications of these pumping outfits, together with efficiencies and prices, will be furnished by the above companies upon request.

A New Excavator and Levee Builder.

An engraving on page 261 shows an automatic excavator and levee building machine invented by J. H. L. Took of this city.

This machine is adapted to both dry and wet work. When required for dry work it is mounted on a portable railroad track. The machine moves automatically along the rails by means of a rack and pinion, the speed being easily adjusted by the engineer. For wet work, the machine is placed on a flat boat.

One of the peculiar features of this machine is the series of small double mouldboard plows attached to the alternate links of the bucket chain. These plows cut from one-half to one inch deep into the bank, thus loosening a sufficient amount of material to fill the following bucket. By this means the buckets are left to act only as conveyors of the material. This reduces the power required very greatly, and the wear of machinery is much less than by the old plan of excavating by the buckets themselves.

The swinging boom rests on friction rolls that receive both the lateral and vertical weight of the boom, buckets and plows, thus reducing the strain on the main shaft to a minimum.

There is a reciprocating joint on which the drum carrying the boom and excavating machinery is located. This allows the boom to swing to any angle without changing its relative position to the driving shaft.

The novel arrangement enables one man to run the entire machine, cutting a ditch from three feet to 20 feet in width, and to any depth down to 20 feet. A medium-sized machine is capable of excavating from 2000 to 4000 cubic yards every 24 hours. The largest size has a capacity of 10,000 yards in 24 hours.

The bottoms of the buckets open automatically to discharge the contents into the conveyor, which deposits the material when wanted. As soon as the bucket is discharged the bottom closes and locks. The machine is quite ingeniously constructed. The plow feature is a very important one, leaving the buckets only the work of removing the loosened earth.

A Reducing and Amalgamating Plant.

An engraving presented on page 261 shows a plant for reducing ore by a Dodge mill, such as was described and illustrated in the Press of Aug. 8th last. The Dodge pulverizer now comprises many improvements which are the result of experience in working gold ore. Parke & Lacy of this city, the manufacturers, are prepared to erect complete mills on this system on the general plan shown in the engraving. These mills are doing exceptionally good work in several places on this coast. They are made to work either wet or dry. In the complete plant, everything moves by gravitation, on the modern system of mill-building, as the engraving shows. In this plant, the pulverizing, amalgamating and concentrating are all accomplished.

A Tipping Ladle-Car.

At the Hoerde Works, Westphalia, on the basic-converter practice, the pig metal is weighed off in 10-ton charges. It is brought to the converter in a tipping ladle of the form shown in the accompanying cuts. Three converters are used in alternation. The bottoms have 72 cylindrical holes, 17 to 18 mm. in diameter. With a blast pressure of 30 pounds the duration of a blow is nine minutes before decarbonization, and five minutes after it. The ladle car is very heavy, as may be imagined from the load it has to carry. The cuts are self-explanatory as to construction.

TEN-TON LADLE-CAR AT THE HOERDE WORKS, WESTPHALIA.

S. Lyle, Geo. R. Wells and C. O'Connor. Chas. H. Fish was appointed Pres.; Geo. R. Wells, Vice Pres.; A. W. Havens, Sec.; D. B. Lyman, Supt.; and Nevada Bank, Treas.

The California Powder Works are preparing to manufacture a smokeless powder, and a small plant is now under way at Benicia. The smokeless powder which it is proposed to make will be from a formula similar to that used in the European manufactories.

water front from Broadway to Francisco street in a double track system, both narrow and broad gauge. There are, in addition, for switching facilities, ten side-tracks built into the sea-wall, from lots 10 to 14 inclusive. There is track enough at present to accommodate 150 cars, and within a short time it will be increased for 400 or 500 cars. Two freight-sheds, one for the broad-gauge trains of the Donahue system and the other for the narrow-gauge cars of the Santa Cruz Division of the Southern

rich portions of a vein of mineral can be at once discovered. Just what the machine is, nobody seems to know, but it is a small instrument that can heresidly carried in the hand.

ELECTRIC RAILWAY.—The Los Gatos Board of Trustees granted F. Chappellet and others a franchise to operate an electric railway through the town. This is part of Howard's San Jose and Los Gatos system. By it the rate of fare

VALUABLE BOOKS ON MINERALS & MINING

A Practical Manual of Minerals, Mines and Mining. Comprising suggestions as to the localities and associations of all the Useful Minerals; full descriptions of the most effective methods of both the qualitative and quantitative analyses of each of these minerals, and hints upon the various operations of mining, including architecture and construction. By Prof. H. S. Osborn, LL. D. Illustrated by 171 engravings. 8vo, 367 pages. Price.....\$4.50

A descriptive circular giving the full contents of the above book sent free to any one who will send his address.

A Treatise on Metalliferous Minerals and Mining. By D. C. Davies. With 148 illustrations. 12mo, 432 pages. Price.....\$5.00

Mine Drainage. By Stephen Michell. 8vo, 277 engravings. Price.....\$6.00

A Treatise on Earthy and Other Minerals and Mining. By D. C. Davies. With 76 engravings. 12mo. Price.....\$6.00

The Prospector's Hand-Book. A Guide for the Prospector and Traveler in search of Metal-bearing or other valuable Minerals. Illustrated. 12mo. Price.....\$1.50

Mineralogy Simplified. Easy Methods of Identifying Minerals, including Ores, by means of the Blow-pipe, by Flame Reactions, by the Spectroscope, and by Humid Chemical Analysis, based on Von Kobell's Tables for the Determination of Minerals, etc. By Henry Ernst, M. D. Illustrated. 12mo. Price.....\$3.00

Underground Treasures; How and Where to Find Them. A Key for the Ready Determination of Minerals within the United States. By James Orton. Price.....\$1.50

The above or any of our Books sent by mail, free of postage, at the publication prices, to any address in the world.

Our New and Revised Catalogue of Practical and Scientific Books, 88 pages, 8vo, and our other Catalogues and Circulars, including a List of Recent and Standard Works on Metallurgy, Mineralogy, Mining, Assaying, and Chemistry, sent free and free of postage, to any one in any part of the world who will furnish his address.

ROPER'S

Practical Handy Books for Engineers & Firemen

By STEPHEN ROPER, Engineer.

The Engineer's Handy Book, containing a full explanation of the Steam Engine Indicator, and its use and advantages to engineers and steam users, with formulae for estimating the power of all classes of Steam Engines. Price.....\$3.50

The Young Engineer's Own Book. Containing an Explanation of the Principles and Theories on which the Steam Engine as a Prime Mover is based. Price.....\$3.00

Questions and Answers for Engineers. This little book contains all the questions that Engineers will be asked when undergoing an examination. Price, \$3.00

Handbook of Modern Steam Fire Engines. The only book of the kind ever published. Price, \$3.50

Catechism on High Pressure, or Non-Condensing Steam Engines. Price.....\$2.00

Care and Management of the Steam Boiler. Price.....\$2.00

Handbook of Land and Marine Engines. Price.....\$3.50

Handbook of the Locomotive. Price.....\$2.50

Use and Abuse of the Steam Boiler. Price.....\$2.00

Instructions and Suggestions for Engineers and Firemen. Price.....\$2.00

These books embrace all branches of Steam Engineering—Stationary, Locomotive, Fire and Marine. Any engineer who wishes to be well informed in all the duties of his calling should provide himself with a full set.

MINING ENGINEERS.

EVERETTE'S MINING OFFICE.

Pioneer Mining Office of the Northwest Coast.

Having the largest permanent brick assay furnaces, chemical laboratory and mining office on the Northwest Coast; with a collection of about 4000 samples of the ores of Alaska, British Columbia, Oregon and the Northwest Territories, and having made personal examinations of nearly every mining camp on the Pacific Slope, from California to Alaska, I am prepared to do any class of legitimate and honest mining work, such as EXAMINING, ENGINEERING, SAMPLING AND REPORTING ON THE VALUE OF ALL MINERAL, COAL AND FIRE-CLAY PROPERTIES, BUILDING STONES, EARTHES, ASSAYS AND ANALYSIS OF ORES, WATERS, CHECK SAMPLES OF ORE, PULPS, "ORGANIC ANALYSIS" WORK, and in fact any work connected with the office of a first-class mining geologist and chemist. Any information mining men may desire to know relative to the MINERAL OR COAL RESOURCES OF the entire Pacific Northwest will be honestly given. Address Dr. WILLIAM EVERETTE Consulting Mining Geologist and Chemist, 1315 E Street, Tacoma, Wash.

A. S. GRANT.

S. B. CONNOR.

SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE CRIMPED MINING CLOTHS.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.
Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

Eastern Metal Markets.

By Telegraph.

New York, October 22.—The following are the closing prices the past week:	Silver in Silver	Copper.	Lead.	Tin.
Thursday..... 44 1/2	96 1/2	12 1/2	4 3/4	20 1/2
Friday..... 44 1/2	96 1/2	12 00	4 3/4	20 05
Saturday..... 44 1/2	96 1/2	12 00	4 3/4	20 05
Monday..... 44 1/2	96 1/2	12 1/2	4 3/4	20 10
Tuesday..... 44 1/2	96 1/2	12 1/2	4 3/4	20 10
Wednesday..... 44 1/2	96 1/2	12 00	4 3/4	20 15

Borax is easier, with better arrival; concentrated, Sci refined, 80c in car lots. Quicksilver is strong at an advance. Tin is quiet and fairly steady. Copper is dull and heavy. Lead is nominal. Iron at Philadelphia is not in a very satisfactory condition. Prices are unsettled and a little inclined to droop. The weakest articles on the list are steel blooms and billets, pig iron being the steadiest.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. C. HOAG—San Francisco.
R. G. BAILEY—San Francisco.
F. K. MERRITT—San Francisco.
J. T. AUSTIN—Pittsburg, Cal.
Geo. Wilson—Sacramento Co.
J. H. CROSSMAN—Perris, Cal.
CHAUNCEY A. DAYTON—San Lucas, Cal.
G. R. GILL—Cambria, Cal.
WM. T. HEALD—Cloverdale.
MRS. GERTRUDE DECKERS—Fillmore, Cal.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

IN AID OF SCIENCE—Walter Law, of W. J. Sloane & Co., of New York City, has presented \$1000 to the Lick Observatory for the purpose of publishing a series of enlarged heliographic plates of the moon, made from the photographs taken with the great telescope.

ALASKA PLACERS.—A large number of miners have returned to Port Townsend from Alaska. Good success in the placers is reported. At Silver Bow basin, \$12,000 was taken out in one day. Some nuggets from \$50 to \$240 were also found.

MINING AND SCIENTIFIC PRESS.

Assessment Notices.

CALIFORNIA AND ARIZONA MINING COMPANY.
Location of principal place of business, 330 Pine Street, San Francisco, California. Location of works, Mohave County, Territory of Arizona.
Notice is hereby given that at a meeting of the Board of Directors held on the 23rd day of September, 1891, an assessment (No. 4) of Ten Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in U. S. gold coin to the Secretary, at the office of the Company, 330 Pine Street, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 9th day of November, 1891, will be delinquent and will be advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 30th day of November, 1891, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors.
T. E. JEWELL, Secretary.
Office, 330 Pine Street, San Francisco, California.

NEW EL DORADO GOLD MINING COMPANY.
Location of principal place of business, San Francisco, California. Location of works, Greenwood, El Dorado County, California.
Notice is hereby given, that at a meeting of the Board of Directors held on the 23rd day of October, 1891, an assessment (No. 3) of Five Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, No. 310 Pine Street, Rooms 15 and 17, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 5th day of November, 1891, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on FRIDAY, the 27th day of November, 1891, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors.
J. W. PEW, Secretary.
Office, No. 310 Pine Street, Rooms 15 and 17, San Francisco, California.

PROPOSALS FOR TUNNELS

OFFICE OF THE CHIEF ENGINEER OF THE Arrowhead Reservoir Company, San Bernardino, California, October 10, 1891.

SEALED PROPOSALS

Will be received by the undersigned until noon of TUESDAY, the 15th of December, 1891, for the construction of three tunnels—ons of about 2000 feet in length, the second about 4000 feet in length, and the third about 6000 feet in length, through rock, in accordance with plans and specifications on file in this office.
Proposals must be accompanied by a certified check in the sum of \$2000, to be returned to the unsuccessful bidders. The Company reserves the right to reject any or all proposals.
A. H. KOEHLIG,

J. H. ISHAM, Secretary.

THE ORIENTAL GAS ENGINE

IS THE BEST, because it combines simplicity of construction with power and economy in space. It can be run with natural or manufactured gas or gasoline at a cost of 20 to 25 cents per horse power per day.
It can be used for pumping purposes, as well as for all purposes where a perfect engine is required, with the advantage of lessening the risk of explosion. No licensed engineer at a high salary needed to operate it.
Send for circulars and prices if a good safe engine is what you need.

SHEET
IRON
PIPE

ALL SIZES, FOR GAS, STEAM AND WATER.
— WE MANUFACTURE —

SHEET IRON AND STEEL PIPE,

ALL SIZES.

For Water Supply, Mining, Irrigating Purposes, Stock
Ranches, Etc.

Made in Lengths Desired from 16 to 30 feet.

The Cut shows a Section of Three Joints

DOUBLE RIVETED SHEET IRON PIPE.

In the manufacture of this Pipe, we use only a high grade of annealed
Charcoal Iron of great tensile strength.
The weight or thickness of metal used, is graded according to service
required, and pressure to which the Pipe will be subjected.

FOR ALL UNDERGROUND PURPOSES, we immerse the Pipe
in a bath containing a special mixture of ASPHALTUM, PITCH and
PETROLEUM, at a Temperature of 300° Fahrenheit. It thus
receives a thorough coating, both inside and outside, rendering it impervious
to the alkalies of the earth, rust, etc., and is practically indestructible.

Plates and Best Gold, Silver
and Nickel Plating.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Concentrating Belt manufactured in San Francisco; we can therefore fill all orders on short notice. The length and width of these belts are the same as is used on the Frue or Triumph Concentrating Machines, but can be made of any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen. First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight rifles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 1300 IN USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

FRUE ORE CONCENTRATOR

OVER 3000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

Manufactured under Patents of April 27, 1880:

September 18, 1883; July 24, 1888;

and March 31, 1891.

NEW DOUBLE-DISCHARGE LEFFEL WATER WHEEL.

New Double-Discharge Leffel Water-Wheel.

The James Leffel Turbine water-wheel stands before the public a thoroughly tested and reliable hydraulic motor. The most exacting practical tests have proven the original design of this wheel to be such as secures the greatest economy of water at an average of full or part gate, together with great durability and ease of management with the highest useful effect.

It has been the aim of the James Leffel & Company, Springfield, Ohio, the manufacturers, to improve the minor working parts of the wheel, through greater accuracy in their formation, and superior quality of material. Nearly 30 years of diligent study and practical experience by the principal members of the firm, and the highly competent men they have now in their employ, has enabled them to effect these most desirable improvements, which are now to be found in all the wheels sent out from their works.

Our illustration shows the latest-style double-discharge Leffel water-wheels, on horizontal shaft. It is a cast-iron casing, joined and divided into a number of parts, in such a manner as to admit of separating them for the purpose of light transportation by pack-mules or men. When shipment can be made by the usual transportation facilities, the wheel is sent intact. In this form of wheel, great strength and compactness is secured without unusual weight. All sizes of this style from the smallest up to 30½ inches are manufactured.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

Products of the Mining Counties.

Agricultural and Horticultural Conditions.

EDITORS PRESS:—Perhaps some of the PRESS readers would like to know a little more about the counties that I have traveled through on my late trip in Tuolumne, Calaveras, Amador, El Dorado, Placer, Nevada, Sierra, Plumas, Tehama, Shasta, Butte, Sutter and Yuba.

Tuolumne

Has a large body of farming land in the hills. This is principally devoted to wheat, though there are little valleys high up in the mountains, where fruit, potatoes and grass-hay are grown to a good profit. Lower down, along the line of the mining towns, are a large number of small ranches devoted to fruit and vegetables. Still lower down is a plain, where wheat forms the principal crop. In the lower part of the county, near Chinese Camp, are several very fine and extensive fruit ranches. The mining towns furnish a good local market. The climate is all that could be desired. Taking the county as a whole, it is safe to say that anything can be raised in Old Tuolumne, and with the same degree of profit as in any portion of the State.

Calaveras.

The upper part of the county is very mountainous, with here and there a choice mountain ranch, where potatoes, hay and apples are grown at a high profit. At West Point, which is about the highest town in the county, the fruit ranch of Mr. T. R. Smith shows the heaviest crop of fine fruit that I have seen any where in the State. Along the foot of the upper mountains, as at Murphys, Douglas and Vallecito, are a succession of fruit and vegetable ranches, largely owned by Italians. Below this is a dry range of country that could be irrigated, if desired. This section is used in growing wheat and barley hay. Below this is the fine Salt Spring valley, with its great extent of wheat fields. Valley Springs is another charming valley, principally used in growing wheat. Below this follows a section where fruits, the orange and olive, are largely and successfully grown. Still lower comes the black, loamy lands along the rivers, where any crop can be grown.

Amador.

The upper portion of Amador county differs but little from Calaveras in her mountain ranches; as you go lower down, but still in the mountains, follow the vegetables and fruit ranches of the Italians. Still lower down come the wheat fields, and along the rivers and spreading out into the Sacramento valley a class of land that for fertility and general adaptation to all manner of farming, cannot be excelled. The famous Q ranch of Mr. Geo. Woolsey, near Ione, shows how well fruit will do in this section.

El Dorado.

The lower part of the county is devoted to grazing and wheat, though a belt is given to fruit culture—from Shingle Springs, El Dorado, Diamond Springs, Placerville and across to Coloma. The fruit interests are now the leading ones in all this section. Above this, as at Garden Valley, Grizzly and Georgetown, are fine mountain ranches devoted to hay and apples.

Placer.

The extent of the fruit industry throughout the belt from Lincoln and Roseville up to Rocklin, Loomis, Newcastle, Auburn, Applegate and on up to Colfax, is so well known that it is hardly necessary to dwell upon it. The whole country is fruit, with the peach predominating, though all the other fruits and crops do equally well. It is a difficult matter to say which is the better part of the county, as those on the Granite, or lower irrigated belt, claim that their soil and location are best adapted to fruit. As you reach Auburn and get on to the slate soil, the people here are equally emphatic in claiming that their soils are the best; while the people on the upper unirrigated soils claim they have the best of it. To an outsider it looks as though the early irrigated belt would prove the best for shipping fruit; the higher lands the best for canning or drying fruit, as it is more firm and meaty, while the still higher soils excel in the fine grapes of Colfax and the general excellence of the pear crop. Now don't infer that peaches are not grown up there, for you will find the peach all the way up, and fine ones, too, while the olive, fig and orange are grown and produced wherever found. Placer is the leading fruit county of the State.

Nevada.

The fruit interests of the county seem small when compared with Placer, but the fruit grown is none the less good. Nevada justly claims to be in the Bartlett pear and apple belt. In these she excels, though she raises oranges, figs and peaches equally as well.

There is not the same extent of farming land in Nevada that is to be found in Placer, as Nevada's principal interests center in her famous mines; but there are some very choice pieces of land extending from Chicago Park across to Rough and Ready and up to North Bloomfield. The famous Barren Hill Nursery of Mr. Felix Gillette is situated at Nevada City, where a practical demonstration of the capacity of the soil is shown in the great variety of fruits and nuts that adapt themselves to this soil and climate.

Sierra.

Driving up through the mountains, you form the opinion that Sierra's wealth is in her mines, as the ranches are small and not numerous; but when Sierra Valley spreads out at your feet, with its great extent of grass-covered acres, you are forced to think otherwise. The principal crop is hay, though dairying and stock-raising are largely followed.

Plumas.

Who can do justice to Plumas in mid-summer with her emerald gems of mountain meadows, scattered from end to end, a succession of gems separated by grand old mountains whose feet are washed in crystal streams that the toothsome trout, with an eye to the beautiful, has selected for his summer home. Dairying and stock-raising are here the principal occupations of the people.

There is a prospect of a railroad being built to this, the Switzerland of California, this year. Should it run up from Oroville, take a trip to this section next summer and satisfy yourself that life is worth living if it includes a trip to Plumas every summer.

Lassen.

This county has an excess of lava, which, while it covers a vast area, makes the land not covered all the more attractive and desirable. Clover Valley, Long Valley and a large section surrounding are given up to dairying. Along the Honey Lake section, from Milford to Susanville, is a succession of farms where hay and fruit are grown. The principal interests of the county may be said to be in the direction of hay, stock and butter.

Tehama.

The lower portion of the county does not differ from the rest of the Sacramento valley. As you get up higher the crops change from the great extent and large holdings of wheat lands to small fruit ranches. The country is mostly level, except the barren strip along the east and bordering on Lassen. Very fine fruit is grown on the rich bottom lands of the county, though the uplands do very well. The soil runs from loam to gravel. The wheat and sheepmen own the bulk of the county and in consequence wheat, wool and mutton are the main products, with fruit fast gaining on them.

Shasta.

About Redding and below is a belt that differs but little from Tehama, being level land, where wheat, stock and fruits are grown; above, the country becomes very mountainous, and while there are occasional small farms, the principal interest is the rich and extensive gold quartz mines which afford a good local market for the farmer.

Butte.

I doubt if there is a county in the State where there is so little land that can be called waste land. The hills take up but a small portion and there is an absence of alkali and hog-wallow lands in the plains. Gen. Jno. Bidwell's famous Rancho Chico shows how well the rich soil of the valley is adapted to all manner of fruits; though Oroville, with her mild climate and orange groves, proves that the hill lands are equally valuable. Fruit is rapidly coming to the front all over the county, and in time will be the industry of the county.

Sutter.

The owners "know a good thing when they see it," and so have located here and make the fruit-growers happy by contracting for their crops, while the trees are but in blossom. The principal fruits are the peach and apricot, which here, on these rich lands grow to the greatest degree of perfection without irrigation, and there are thousands of acres just as good now growing grain that in time will pour out a harvest of golden fruit that can be increased in extent, until it equals the present output of the entire State.

Yuba.

Yuba's red soil is generally given to grain, but along and near the river edge are rich belts that leave nothing to be desired. At Wheatland is a long rich belt of river bottom land that makes one feel as Moses must have felt when he viewed the land he was not allowed to set foot on; for the only fault that I could ever see in this section was the fact that none of it is for sale. On this rich belt hops, alfalfa, corn, vegetables, fruits and any crops sown or planted produce in greatest abundance.

A General View.

It is a difficult matter to thus briefly describe the characteristics and products of the different counties, but if I were seeking a home—now hear in mind this is an individual opinion and not that of the PRESS—if I wanted health, I should prefer the mountains; if fruit was my hobby and I wanted to ship East, I should take Placer Co.; if for canning or drying, Sutter, Butte, Yuba, Tehama and the lower part of Amador; if the dairy, then Plumas or the Sierra Valley of Sierra county, or some of the choice valleys of Lassen; if I wanted a good home market, the mining counties. But it is all California, and with the exception of a few of the higher counties the same crops can be grown in some parts of all, from the orange to the apple. What the farmer wants most is a profitable market; given this, and every acre will be made to bring forth fruits. Supply follows demand, and when there is a general profit in all branches of the farm there will be no need of "Immigration Societies."

With thanks to the good people all along the

line whom it has been the good fortune of the writer to meet on this trip, I remain yours respectfully,
E. H. SCHAEFFLE.
At Home, Murphys, Cal.

Hydraulic the Mud from Our Waters.

EDITORS PRESS:—The fact that the railroad freight rates of this State have for many years been from five to ten times as much as the Eastern rates is just beginning to be understood as the reason why our people are not more prosperous, when in everything necessary for the prosperous maintenance of a much larger population, our State stands pre-eminently in the front.

We have products of infinite variety in abundance that the world at large wants and will take at reasonable rates; but our ways to market have been closed by combinations and high charges, to the extent of leaving the producer without profit or any hope for the future.

We cannot have real prosperity until legitimate competition is provided, and I know of no quicker or more economical method than to open up the water-ways of our State. The agricultural portion of the State is principally in the valleys, in which are streams that were once navigable and which, if reopened, would furnish the necessary competition.

In order to accomplish this, I would advise those owning stern-wheel steamboats to provide a suitable steam pump of good power, connected with steam and water pipes, to draw water from under their boats, and deliver it, with suitable pipes and contracted nozzles, at the stern of the boat, under the water, at an angle of about 45 degrees, so that the force of the jets would stir up the mud in the stream's bottom, and would also assist in the propulsion of the boat and in forcing the mud down stream. Successive boats following each other in the same channel, together with the concentration of water into the narrowed channel with its accumulated scouring force, would, I think, soon deepen the stream enough for boats of large tonnage.

Such a pump, with a single large hose, could be used to extinguish fires on the boat or at her landings, or as a fire boat, and also to hydraulic away impediments to navigation, in narrow, crooked creeks and sloughs, or in piping out landings for farmers or others, and if the plan is practicable, short lines of good roads would soon be established, leading from the various settlements to the most favorable landings, and thus provide cheap transportation for perhaps nine-tenths of the heavy products of the State. Even gravel, hars of moderate width in the upper rivers, might be cut through by this method, if undertaken at a season when the water was favorable, or the many sloughs and creeks around the hay—that are now only navigable at high tide—might be cut deep enough to be used at all tides, at a moderate expense.

Even the mud in the harbor of San Francisco could, I think, be piped out at strong ebb tide much cheaper and quicker than it has been done, and I would suggest to the Harbor Commissioners that it would be well to try an experiment of this kind with the fire tug, Gov. Irwin, at the north end of city, by letting down her hose, properly weighted, into the mud at strong ebb tide and see whether the mud cannot be floated away more rapidly than to take it out by the bucketful.

It will require but little money or time to ascertain whether the method offered is practicable or not. The mountains are being washed gradually into the sea by Nature's process and man's ingenuity, and with but little assistance in the same direction by agitation and concentration of the waters in narrow channels, the law of gravitation will do the rest.

Oct 19, 1891.

R. G. SNEATH.

Calico District.

EDITORS PRESS:—The Silver King mine is shipping 60 tons per day of good ore to the Waterloo mill. The output of this mine has been increased 100 per cent since the narrow-gauge railroad was built here.

The Waterloo is running as usual, and making a daily output of about 50 tons.

The Waterloo Mining Co.'s 60-stamp mill is running steadily on ore, and their 15-stamp mill on tailings which were run through the mill some years ago.

The Silver King Mining Co. keeps its mill active, with ore from the Oriental, No. 2, Red Cloud, Mammoth, Silver, Odessa and Occidental mines. This property is improving daily.

From the Bismarck mine, chlorides have been taking some very good ore. There are at present 150 tons of high-grade ore upon the dumps of this mine awaiting treatment.

A new five-stamp mill being erected by Stephens will be in running order about the 1st of November. This mill has been erected to treat ores from the chlorides of this camp. The Alvord, a new company, is about to erect a 100-stamp mill at this gold mine of fame.

MINER.

Los Angeles Coal.

Coal has been discovered on the ranch of O. E. Roberts, three miles west of the city limits of Los Angeles. The locality is near Hollywood, at the edge of the foothills, about a mile this side of the Cahuenga Pass and half a mile north of the terminus of the dummy line which connects with the Temple street cable road. Mr.

Roberts related to an *Express* reporter to-day the story of his discovery. "We wanted water," said he, "and thought we ought to strike it in a sandstone ledge which crosses my place and shows plainly at the surface. The whole ranch is underlaid by sand rock, but this ledge is of a different sort. It is from 50 to 200 feet wide. We began two weeks ago to sink a shaft on the ledge, and are now down 65 feet, in sandstone all the way. At a depth of 50 feet we struck a carbonized ledge, which is from six to seven feet in width, carrying veins of coal that are from an inch to three inches wide. We are now running a drift to follow a vein of coal which shows 13x3 inches. The drift is in four feet from the shaft. I think we are bound to develop something of value and importance. We have tested some of the coal in a blacksmith's forge, and it burns well, giving out a strong heat. It seems to be fully as good as the ordinary blacksmith's coal." Mr. Roberts showed some specimens taken from the coal veins, and also of the sandstone ledge in which the coal is found. The coal seems of fair quality. It is of the so-called soft, bituminous sort, compact and heavy, and entirely distinct from the lignite which has often served as the basis for an announcement of "coal" discoveries in this State. The present development may be regarded as at least encouraging and hopeful, and it is important as indicating the presence of carboniferous ledges in this neighborhood. Should a vein of coal a few feet in width be developed near Los Angeles, it would prove a valuable property.—*Express*.

A Great Live Stock Enterprise.

Within a few months, there has been organized and pushed to a fair stage of progress, one of the largest enterprises that has been undertaken on this coast for many years. One that is likely soon to arouse the lively interest of a large class including capitalists, manufacturers, stock-raisers, workmen and home-seekers, about equally. Although less than 12 miles, and but 30 minutes by rail from the business center of San Francisco, so quietly have the projectors' movements been made, that comparatively few know of the great work already done, and still less realize the magnitude of the general plans and improvements contemplated.

A little more than a year ago, the South San Francisco Land & Improvement Company composed of well-known Chicago, Omaha and local capitalists, was organized for the purpose of creating and promoting a manufacturing and residence suburb to the city of San Francisco that should combine as far as possible all the attractive and practical advantages of location obtainable. With this object in view, after a careful survey of the field, the company, through its resident manager, Mr. Peter E. Her, purchased a large tract of land in San Mateo county, adjoining the city and county line of San Francisco, having a water frontage on the bay of about seven miles. This body of land includes the old Miller & Lux stock ranch, as well as several adjacent holdings, and aggregates some 3400 acres.

The Aims and Plans

Of the company are clearly defined, but are on such a broad and comprehensive basis that an outline only can be given here. Among the leading features of the enterprise which will prove of special interest to readers of the PRESS is the establishment of an extensive abattoir, packing and canning plant upon the latest and most perfect plan, and with the greatest capacity of anything of the kind now in existence; also fertilizing works, stock-yards and horse sales-stables. These, in connection with a deep-water ship canal and basin, railroad tracks and wharves, affording ample shipping facilities, are already under construction, and will be speedily followed by the erection of a hotel and an exchange building on a correspondingly liberal scale.

It is thus proposed for the first time to give the farmers of this and adjoining States a permanent live stock market, where they can find ready sale for their horses, mules, cattle, sheep, hogs, hay and grain—an important fact in itself, not likely to be overlooked by those engaged in these industries. Manufacturing interests will also be provided with every facility in the way of rail and water communication with all parts of the world, as well as cheap and convenient building sites. Such inducements can hardly fail to attract iron and wood workers, lumber interests, brick and coal yards, tanneries, and a host of industries that naturally follow in their train. But by no means stopping here, the company has subdivided and graded streets on a very desirable part of its immense tract for residence purposes. This is high ground, easily drained, and so situated in relation to the manufacturing district that the latter can never prove objectionable.

First-class water-works, fed by artesian wells, are to supply the town with the purest water for all uses and at nominal rates, pipes being laid in front of all property. Concrete sidewalks will be laid on all the main avenues, and a complete system of sewerage will also be constructed as soon as requirements demand it. Many other improvements are under way and enter into the plans of the management, such as banks, hotels, museum and library, fair ground and race-track, electric light and power plant, also an extensive system of electric roads which will supply ample means of intercommunication within the town limits.

These proposed designs are to be carried out

upon the most approved methods that modern science and mechanical skill can furnish, and together with the hay shore out-off, now being built by the Southern Pacific Railroad across the company's property, will give to the resident or business man of this young city every metropolitan convenience and comfort.

machinery on the ground to be put in place as soon as the buildings are ready for its reception. The company is conducting most of these heavy operations under its own direct management, and is proposing to push the work with still greater energy during the coming year.

EXCHANGE BUILDING.

FERTILIZER AND DRIER BUILDINGS, ENGINE AND ICE MACHINE, ETC.

ABATTOIR BUILDING.

A GREAT LIVE STOCK ENTERPRISE NEAR SAN FRANCISCO—SITUATION AND BUILDINGS IN CONSTRUCTION.

The map and illustrations on this page show the favorable position occupied by the town and its unlimited transportation possibilities.

Work Accomplished.

Early in February of this year, a meeting of the Board of Directors was held in Bidden, on the site of their prospective city, at which \$450,000 was appropriated toward dredging the ship canal and tidal basin, erecting abattoirs, meat-canning factories, stockyards, grading the main avenues, completing water works, sinking artesian wells, etc. This sum to be supplemented from time to time, as the work progresses.

A representative of the PRESS who visited Bidden recently, to learn what this large amount of money was accomplishing, found a force of about 300 men engaged in pushing the work rapidly forward, as per program. The grading of Grand, Swift and Railroad avenues was found to be nearly finished. Two artesian wells are flowing over a million gallons in 24 hours. The stockyards, abattoirs, fertilizing works, ship canal and basin are all in an advanced stage of construction. Of the latter, over a half-mile of dredging and pile-driving is completed, while there is a large quantity of

The South San Francisco Land and Improvement Company is incorporated with a capital stock of \$2,000,000, all of which has been subscribed. It is to exist 50 years, with its principal place of business at Bidden, San Mateo county, California. Gustavus F. Swift, one of the largest packers of meats in the world, with packing houses in Chicago, Omaha, and Kansas City, is the President; Charles W. Smith, formerly vice-president of the Atchafalaya Topeka and Santa Fe Railroad Company, Vice-President; Peter E. Her, one of the largest stockmen of the west, 2d Vice-Pres., and Sec'y., E. R. Lillenthal of San Francisco, Treasurer; Obed Horr of Chicago, Auditor. Prominent among names of the stockholders are: P. E. Her, Nelson Morris, Edward Morris, G. F. Swift, Armour & Co., J. B. Greenbut, H. J. Crocker, J. H. and G. M. Bosler, Charles W. Smith, Miller & Lux, N. Merriam, Livingstone & Co., S. W. Allerton, E. R. Lillenthal, C. W. Craig, J. A. Creighton, H. Keuntz, M. C. Keith, E. F. Hooker, Horne & Chapman, L. W. Hill, P. Bocqueraz, A. H. Veeder, M. Cudaby, H. S. Crocker, J. McCullough, E. J. Martyn, H. Sensinbach, Wm. L. Merry, A. L. Meyer, Kullman, Salz & Co., A. Bessenger, Jas. Hunter M. Erlsbach and B. F. Smith of Boston.

The live-stock interests of the State have long felt the need of a more perfect system for conducting their business, and an outlet for a class of meat that is better adapted for packing than for the retailers' stalls. This immense packing and meat-canning establishment seems likely to meet the requirements.

Mechanical Engineers Coming.

A committee of the Technical Society of the Pacific Coast called a meeting at the Mechanics' Institute on Saturday, Oct. 17th, of a number of gentlemen interested in mechanical and civil engineering, the intention being to get an expression of opinion in respect to the entertainment of the members of the American Society of Mechanical Engineers, should that society visit this city next April, as is now being considered.

At that meeting it was decided to name a committee of representative citizens who should meet and decide on ways and means to carry out this object.

The committee selected is as follows: Governor H. H. Markham, John Richards, Geo. W. Dickie, James Spiers, Irving M. Scott,

Robert S. Moore, A. W. Stahl, W. R. Eckart, P. Noble, Ira P. Rankin, Byron Jackson, A. P. Brayton, Oscar Lewis, James G. Fair, S. W. Henshnst, Chas. Marschutz, H. J. Small, Herman Schnsler, Chas. G. Yale, Mayor G. H. Sanderson, Joseph Crockett, Horace B. Gale, J. D. Spreckels, F. C. Hesse, J. W. Moore, Marsden Manson, Chas. Goodall, Wm. H. Henr, A. H. Payson, A. S. Hallidie, Geo. E. Dow, John Hays Hammond, Ang. J. Bowls, E. J. Molera, H. W. Harkness, J. B. Stetson, A. Sutro, Otto Von Geldern.

The American Society of Mechanical Engineers is one of the most distinguished bodies of the kind in this country or abroad. It embraces not only nearly all the eminent mechanical engineers, and a large number of civil engineers of the United States, but also many distinguished members from other countries.

This society, the Associations of Civil and Mining Engineers, make up the three great technical bodies of the kind in this country, and it is expected that a visit here of the Society of Mechanical Engineers will be followed by similar meetings on this coast of the mining and civil associations.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

ENCOURAGING.—*Amador Ledger*, Oct. 21: Mining interests are looking encouraging. At the Hector they are making preparations for taking the water out of the shaft so as to explore the bottom level, which at the last 100 feet of sinking was not drifted a foot. Mr. Valentine feels satisfied, from all the information that he can gain, that they will strike a paying ledge at this level. Sinking at the Wildman is to be deferred a little, on account of some needed repairs to the shaft, also to the pumping machinery, which they are now very busy putting in order. Sinking at the South Eureka is going along rapidly. They are down about 200 feet. The ground has become somewhat harder, which will necessarily retard progress to some extent. Small stringers of quartz appear in the shaft, which indicate that the ground is not barren. Developments at the North Star are a little more favorable. The ground has become so soft that timbering is necessary. They are in a slate or gouge formation. They will run on to the end of the month, when it is probable unless something of a definite character turns up, the work will be abandoned.

MISCELLANEOUS.—About 60 tons of ore from the White claim, north of Jackson, has been hauled to the Amador gold mine for crushing. Ten stamps of the Amador mill have been put in running order to crush this rock, and the mill was started Monday last. George Thomas, who has bonded the White mine, is having this ore crushed to test its quality. The rock to all appearance is very similar to that of the Zelle. It is of the greenstone character, and is heavily charged with sulphurets. At the Hardenburg mine, sinking was inaugurated a couple of weeks ago. They are keeping the ten-stamp mill running steadily and sinking at the same time, and expect to do so right along. Walter S. Jones of San Francisco has bonded the Gold Mountain quartz mine, at Quartz mountain, Lower Rancheria, from Maurice Dore of San Francisco, for the sum of \$30,000, \$10,000 to be paid Oct. 1, 1891, balance on or before March 1, 1892. At the New York mine, the roller stamp-mill is in place, and the work of laying the pipe to convey water to the mill will be completed in a few days. It is expected to start the mill by the middle of next week.

Calaveras.

SANDY BAR.—*Calaveras Chronicle*, Oct. 21: Supt. Davison reports that the Sandy Bar mine is now extending the tunnel (No. 2) on the lead. The lead is three feet wide, showing a large amount of sulphurets. As soon as the ore body, known to exist about 25 feet farther in the hill, is encountered, more men will be put on and stoping of ore will then be done.

RICH ROCK.—We were shown some very rich rock last Wednesday that was taken from the Lone Star mine, at West Point. The rock was taken from the lead at a depth of 500 feet from the surface. We are informed that there is enough of the ore in sight to repay the owners for all outlays up to the present time.

IT WAS PATENTED.—*Calaveras Prospect*, Oct. 24: G. M. Stage and other parties from near Burson have recently been prospecting on La Chapelle Flat, near El Dorado, but have been obliged to quit. It seems the parties located a mine there on what was supposed to be vacant land. They went to work in good faith, had their claim surveyed and duly recorded. They sunk a shaft about 60 or 70 feet, found the channel and a very good prospect. Then comes Phil Harkins, and from what was done, the parties became suspicious that all was not right, and on a more careful examination of the records, found that the ten acres they were at work upon was a part of Harkins' patented mine, and they were obliged to vacate.

El Dorado.

NOTES.—*Georgetown Gazette*, Oct. 22: Some new machinery arrived for the Van mine this week. We are pleased to hear that the unpleasant conflict which has existed in the Taylor mine affairs has been settled. The Stanton Co. have finally cleared the old 52 tunnel in the Jones Hill mine, and are now taking out pay gravel. Col. Dent and James Davis have begun development work on their seam-pocket mine on Crane's gulch south of town. We hear that the bonders of the Darling mine are so well pleased with the results of their extensive development of the mine that they have purchased it outright. The Blue Rock Co. is cutting a new ditch from Canyon Creek, and making other improvements. The Beattie mine was recently equipped with a new line of sluice-boxes. The Georgia Slide mines hold their own right along. J. H. Anderson started up the old Parsons mine last week, and the work of washing away the deep surface ground of this famous rich pocket mine through the long line of new sluice-boxes begins favorably.

Humboldt.

MAPLE CREEK COAL.—*Blue Lake Advocate*, Oct. 27: The *Advocate* had a call the middle of the week from J. J. Kehoe of Eureka, who was on his way home from the Preston coal mine with some samples of coal. Four men have been at work right along, and the shaft is now down 35 feet. The deeper the shaft is sunk, the better the quality of coal seems to be. The men are following the course of the principal vein, which dips at an angle of 45 degrees, and Mr. Kehoe further declares that careful observation discloses the fact that outcroppings of coal are numerous in the neighborhood of the mine, and that at one place, one mile and a half northeast of the scene of operations, another vein as large as the one being worked has been discovered.

Inyo.

DARWIN.—*Inyo Independent*, Oct. 23: George Lewis went to Darwin on Wednesday to see how matters are progressing in the mine being operated there by himself and P. H. Mack. He took with him supplies of all kinds, including implements needed in mining. H. Hamilton also went down and will work there during the winter. At last reports the mine was looking very well and a considerable quantity of ore was being taken out.

Nevada.

ENCOURAGING.—*Grass Valley Union*, Oct. 22:

The quartz mining prospects in the Grass Valley district are very encouraging at present. The old mines are doing as well as usual, and the new mines are showing remarkably well. This is by far the best quartz-mining district in California.

RETIMBERING SHAFT.—*Grass Valley Telegraph*, Oct. 20: The Omaha Co. has begun work on the Lone Jack shaft. The shaft will be retimbered from the top to the bottom, and all first-class lumber will be put in. The shaft is 300 feet in depth. While the timbering is going on, quartz is being hoisted through the shaft.

CLOSED DOWN.—The Boston mine in Eureka township has shut down because of a failure to find sufficient paying ore. McBean, Mead and Peard, however, own an extension of the Boston, and in that extension, called the Rainbow, there is a large ledge of good ore.

THE TELEGRAPH MINE.—Buildings are now being erected on the Telegraph mine to inclose the machinery which is ready on the ground to be put in place. The Telegraph adjoins the W. Y. O. D. mine, and is certainly favorably situated for a good future. A limited amount of stock is now on the market for sale at 50 cents per share, payable in installments, and is being readily taken. The shaft on the mine is down 100 feet and all the machinery and everything else paid for to date.

THE BOSTON SHUT DOWN.—*Transcript*, Oct. 19: Thomas Peard returned last night from God's Country in Eureka township where he has been superintending operations at the Boston quartz mine. Work has been suspended at the mine because of a failure to find ore that can be profitably worked. Messrs. Fernbach & Co. have expended about \$40,000 there, \$25,000 of the money being invested in a fine mill. Adjoining the Boston is a mine called the Rainbow and owned by McBean, Mead and Peard who have developed a large ledge of good ore. They have about 100 tons out and will work it at the Boston mill.

A BONANZA OF COPPER.—*Nevada Transcript*, Oct. 24: While in town last night on his way to San Francisco, Dr. R. McKillican, the well-known merchant and mining operator of North Bloomfield, exhibited some specimens of copper ore that were viewed with much interest by all who saw them. They came from the Bull Run ledge, which is situated about half a mile above the town of North Bloomfield. Twenty-one years ago, while Mr. McKillican was superintending the construction of a wooden dam then being put in at Bowman's, he discovered the deposit and immediately located it. He prospected it superficially, and became convinced that it possessed great extent and richness. During the seventies, he erected hoisting works and sank a distance of 40 feet, with encouraging results, when he was called by business to San Francisco, where he remained for some time. During his absence, Frank Souchet relocated the claim, and upon his return, Mr. McKillican bought him out for \$1000 and obtained a United States patent. This summer the owner had a drain tunnel of 150 feet driven, and upon reaching the ledge, found it to be 20 feet thick at the point opened upon. The copper carries seven per cent of silver, also about \$5 in gold to the ton. Mr. McKillican, who has had years of experience as a mining engineer and expert, and has been very successful in his own investments in the industry, says that North Bloomfield is in the same belt as Saco and Copperopolis districts. He regards the Bull Run as one of the most important developments ever made in the county, and it is his intention to soon direct his attention to the working of the claim on an extensive scale.

SEVEN-THIRTY MINE.—*Grass Valley Telegraph*, Oct. 21: The parties holding the bond on the Seven-Thirty mine are ready to go to work in further development of the property, but as delays that could not be avoided have occurred, those holding a bond want an extension of time from the owners of the property. This will probably be arranged and the Seven-Thirty will soon be showing up like its neighbor, the California. These two mines are close together and are supposed to be on the same ledge. The Seven-Thirty's history as a gold producer is a brilliant one.

LONE STAR MINE.—The work is being steadily pushed at the Lone Star mine in Sierra county. The principal owners are Grass Valleyans, all of them being mining men of more or less note. The new tunnel is now being run and is in 400 feet. It is supposed that 100 feet farther and the tunnel will tap the large ledge. The ground is very hard and progress at present is both slow and expensive.

VERY RICH INDEED.—*Grass Valley Telegraph*, Oct. 19: Late this afternoon news came to town, and it is reliable, that the California mine, situated on Deadman's Flat, had struck it richer than ever. The north drift has tapped a ledge literally filled with gold, and it is with pardonable pride that the owners speak of what seems to be the greatest thing ever struck in this part of the county.

OMAHA MINE.—On Saturday last there was quite a ripple of excitement about an "immense" strike in the Omaha mine. Our reporter interviewed Superintendent Geo. Mainhart of the mine, and he informs us that there was no cause whatever for undue excitement; that they struck a two-foot ledge in the 13 level, and that its gold-producing properties are magnificent. In fact, Mr. Mainhart assures us that the Omaha looks better now than it has ever looked heretofore.

ASSAY OF WYOMING ROCK.—Fair samples from the Wyoming ledge, located in Grass Valley township, were sent a few days ago to San Francisco for examination and assay. Returns from the assayer have been received, and the following result is given: Ore from the Powning ledge of the Wyoming mine. No gold visible in ore. The assay shows: Gold, \$599.96; silver, \$19.14; total, \$589.37 per ton. This is very healthy.

FEDERAL LOAN.—*Transcript*, Oct. 21: The history of the Federal Loan mine, just east of this city, is strongly illustrative of what well-directed pluck and energy can accomplish in the business of mining. Two years ago a company, of which the Vincent Bros. (John and Louis) and A. Wutke are the principal stockholders, began the development of the property in the face of difficulties that would have appalled weaker-hearted men. The location, though rich in promise because of discoveries made thereabout by former prospectors, who had worked but superficially, however, was isolated and difficult of access. The company to-day have a good wagon-road giving direct communication with the city. Their five-stamp mill, hoisting and pumping works, boarding house, office, etc., constitute one of the

best arranged and most complete plants on any mine in the county, and what is better than all else, the outflow of bullion is liberal and growing. Just at present a station is being cut at the 400-foot level and drifts will soon be started. The ledge in the bottom of the shaft is good 4 feet in thickness and 15 inches of it is so rich in sulphurets that as conservative a mining man as Hon. B. J. Watson, who was out there yesterday, said to the *Transcript* this morning: "I have never before seen anything so beautiful. It is a veritable jewelry shop and sparkles in the candle light like so many rare and radiant gems." Water is coming in very fast—which is a good sign—and a ten-inch pump, in addition to the two already used, is being put in. A cleanup has been made this week, after a 14-day run, and there is to show for it an 82-ounce bar, besides much more gold scraped from the front of the battery, and a large quantity of sulphurets saved by the two Fuses.

Placer.

THE GRAY EAGLE MINE.—*Herald*, Oct. 24: From what we learn of the outlook, the next important mining development in our county can be confidently expected from this property. There is no reason why as rich a mine as the Mayflower has proved itself to be will not soon be making golden returns for the pluck and energy of the men who have pushed it through the long period of development work. At the present time a slope is being driven down from the tunnel to find the bed of the channel. The flow of water is readily handled by the new steam pump, which is the largest ever taken onto the Forest Hill Divide. The steam for it is brought down from the surface, over 400 feet above where the work is being done in the mine. The arrangements for ventilation and drainage are complete, and everything points to the early tapping of the channel. The formations being passed through are similar to those found in the Mayflower, and confirm the opinions of experts that both mines are on the same channel. The striking of gold in this mine will locate and prove the value of some five miles of deep blue gravel channel, half of which, owing to the shape of the country, can only be worked through the Gray Eagle tunnel. The managers of the mine are considering the advisability of putting in an electric pumping and hoisting plant to replace the present steam pump. The water pumped from the mine will be used under 600-foot head to generate the electricity at a point in the North Fork canyon, a short mile from the mine, and ample power will be developed to do all the pumping, hoisting and drilling required in the mine, and even to run a stamp-mill if the gravel be found cemented, as at the Mayflower. The economy over the present steam plant for pumping and hoisting alone will be several hundred dollars a month, or sufficient to pay all the expenses of the change in six months running.

A RICH MINE NEAR ROCKLIN.—*Herald*, Oct. 24: Harlow Brothers & Co., who have been developing a gravel claim two or three miles east of Rocklin, under the superintendency of James Laird Sr., are reported as taking out the richest pay that has ever been found in that part of the country. So much encouraged are they, that they have put on eight-hour shifts and are working day and night; and are preparing to put in a Cox pan with a capacity of 100 tons a day in which to grind the gravel for the purpose of freeing the gold from the cement, a process which is necessary to get the full benefit of their very rich deposit. They have worked the channel already to the width of 100 feet, but have thus far not got to either rim.

THE GREEN MINE.—The Green quartz mine in the Ophir district has again fallen into the hands of F. X. Lavallee, an old miner of that district and one of its former owners. When Mr. Lavallee owned in this mine some years ago, he made money out of it. He calls it his first love in mining matters, and is as tickled as a man can be to get hold of it again. He says he has a company ready to take hold and start it up just as soon as they can get it. In a few weeks at most, the old Green, he declares, will be the scene of business.

Plumas.

ON GOOD ORE.—*Plumas Bulletin*: Good reports come from the Johnny Bull mine. The mill is running steadily on good ore. A. W. Whitney, superintendent of the Crescent mine, informs us that the sinking of the shaft will be completed in about six weeks. Good progress is now being made. The shaft completed, exploration work will begin.

Shasta.

IGO.—*Cor. Shasta Courier*, Oct. 24: There is quite a boom now taking place in our mines. Jno. Wright took another load of ore to Anderson for shipment lately. W. D. Bull is getting out more ore from his mine. All the arrastras on South Fork are running on average ore. W. R. Streeter has struck a good lead on South Fork. The Bell mine, at Sunny Hill, is regularly shipping good ore.

Sierra.

EXTENSION.—*Mt. Messenger*, Oct. 24: The entire force of men at work in the Extension mine, was laid off about the middle of last week, to put in a blower and to permit the putting in of new bents at the dump, and the raising of the track, etc. These repairs were completed by Tuesday of this week, and the full force put to work that evening.

CHANNEL FOUND.—Joseph Nipo was down from Bunker Hill, Friday. He reports Uncle Nick Berets has indeed found the channel for which he has been looking so long. It lies in a north-westerly direction from the old works. Some little time ago a raise was made and blue gravel found that was rich, eight dollars to the carload, but the bedrock pitched away. The main tunnel is being pushed to get into the channel. R. H. Judson, manager, was down from the Ante Up quartz mine Tuesday last. The company has prospects that encourages it, and will continue prospecting during the winter. Jas. McBride was over from St. Louis, last Monday, and reported times improving over there, and that he had never seen water so low in the creeks as at the present time.

Siskiyou.

SALMON RIVER MINES.—*Siskiyou Telegram*, Oct. 24: Jas. Nally of Sawyer's Bar was in the city for a few days this week, and paid a pleasant visit to the *Telegram*. Mr. Nally informs us that the mines in the Salmon river district are turning out better than for a number of years, although the most of the work is not done on a very extensive scale, as the owners are waiting till the wagon-road over the mountain is completed, thus enabling them to con-

vey machinery, etc., to their mines with greater facility and much less cost than at present. Daggett's mill was sent down this week for a short season, while the Gold Ball mine, as usual, is doing exceedingly well, also other mines working on extensions of the Gold Ball lead. Eveleth & Co. are also doing much better than usual. Taking it all in all, the Salmon country has a future much brighter at present than at any other time since its discovery.

QUICKSILVER.—*Yreka Journal*, Oct. 21: The Siskiyou Quicksilver Mining Co. on Siskiyou mountain has been obliged to tear down the furnaces recently built and rebuild them for finer ore, which requires more brick and larger furnaces. When the ledge was first opened, the superintendent supposed all the ore would be coarse, or consist of large chunks, as in most cinnabar chimneys, but finds that it is fine but rich. The new furnaces will be ready for the reduction of ore again in about a week or ten days. It was the intention to build a fine ore furnace afterward, but owing to lateness of season, and the fear of storms preventing the chances of burning brick and building furnaces, deemed it best to put up the coarse ore-furnaces first. With the construction of the new fine ore-furnaces, and probably retaining some of the coarse ore-furnaces, the company will be prepared to work both kinds of the ore successfully.

QUARTZ.—Allen Davis is still driving a tunnel to strike the quartz ledge on Willow Creek in the mountains west of Gazelle. He has reached a distance of about 54 feet in blasting through the slate rock, and expects to tap the ledge within ten feet more. The assays from the croppings, made by Bell Bros. at Redding and others, show that most of the quartz pays \$32.32 per ton, the smallest assay being \$10. This ledge is believed to be at least 30 feet wide, judging from its extent between walls at the croppings, and is likely to prove an extensive mine, with an unlimited amount of gold-bearing quartz to last for ages. The ledge runs from northeast to southwest, dipping toward the Humburg range in the vicinity of Greenhorn and Yreka. If this mine develops into rich mining property, the range of mountains between Scott and Shasta Valleys will prove as good a mining field as the ranges along the west side of Scott Valley, Yreka basin and the Klamath river region, where valuable quartz mines are now being worked with great success. Wm. A. Chamberlain has found croppings of a quartz ledge on the upper end of Greenhorn creek, at right side of the wagon-road, which prospects very rich, and may prove a valuable lode of good size on being tested by sinking down. Wherever quartz is found on Greenhorn, it generally prospects very rich, but seems to be in pockets, although there certainly must be extensive veins somewhere, either deep down or in the heart of the Humburg range extending along the west side of Yreka from Klamath river to Greenhorn and McAdams creeks.

BAR CLAIM.—The Bentz Bar claim, at Klamath river, near Honolulu, worked by Chinese, still continues to pay exceedingly rich, but the 16 Chinese interested refuse to divulge anything except to admit that the claim is paying dividends. A white miner at work across the river, watching them one day last week with an opera-glass, saw the sluices cleaned up three times on that day, thus showing that the gold must have been quite thick. He also saw the pans filled with an immense amount of the glittering dust, but could not form any idea of the value of that day's cleanup. The Phil Mott claim, below Honolulu, is also yielding rich returns for the work performed, and other companies in the vicinity are taking out great quantities of gold dust from bottoming up the bedrock of the ancient channel of the Klamath wherever found, the stream at present date being away from the ancient course in many localities. The Allen Bros. have the new hoisting machinery in operation at their quartz ledge in Quartz Valley, and will now be able to get out quartz in great abundance for crushing. These boys have one of the richest and most extensive quartz mines in Northern California, and are working it in the best manner by securing all the latest and most improved machinery for success.

Trinity.

EAST FORK MINES.—*Trinity Journal*, Oct. 24: R. N. Skinner, superintendent of the Enterprise mine, East Fork, was in town Thursday and informed us that they had struck on to rich rock on the Lone Jack, and that the strike recently made in the Enterprise is still showing up well, and the ledge getting larger as they run off on it. This has been the best paying property on East Fork, and the prospect is now that it will continue for many years to pay a handsome dividend. The lessees of the Yellowstone are getting out good ore and making a good profit on their crushings. The vein is not large, but large enough to admit of taking out the pay rock without handling much waste.

THE NEW MILL.—Wm. Berry, superintendent of the Globe mine, left Monday for the city. While there he will have a Huntington mill shipped, and an effort will be made to get it on the ground and put in running order this fall. J. N. McDonald has been employed to hew the timbers and erect the building for the mill, and the work was begun this week. McDonald has had experience in building mills, and we look for a good job, quickly done.

OPERATIONS COMMENCED.—We learn that operations are now fully under way at Horseshoe Bend, on the Lower Trinity, by a company composed mostly of residents of Humboldt county. It is proposed to run a tunnel through a high point, and divert the waters of the Trinity through it, and thus mine the river-bed for some distance.

YELLOW JACKET.—W. F. Junkans and Pietro Zulla were in town this week from Yellow Jacket. The arrastra on their property is completed, and as soon as water comes, they will be fully prepared to grind the rock and take out some hullion.

Tuolumne.

RAWHIDE RANCH.—*Union-Democrat*, Oct. 24: The work of development on the Rawhide Ranch mine, belonging to Messrs. Neville of Sonora and Ballard of San Francisco, speaks well for early and large profits. The mine is "en bonanza." It is another illustration of the fact that all the old mines of California—some of them long abandoned—are being reworked with successful results. The mine is under the able and energetic management of Mr. Neville.

PAY ORE.—The mill on the New Albany mine, the property of Dr. John Walker, is steadily at work on pay ore. The work recently done on the north end of the mine shows a large body of fine ore—some exceedingly rich. This is an important de-

velopment, and, taken in connection with the workings and pay ore at the central portion of the mine, the shaft being 832 feet deep from the surface and five levels driven from the shaft, proves the property to be of great value. The property consists of three locations—total length 400 feet. The water power is unsurpassed by any in the State. The Hubbard mine, on the Tuolumne river, now being developed under bond by Messrs. Hamilton & Corbin, of Sonora, promises to be a most valuable property. Its ores are of high quality and the vein is strong and well defined. The work of development of the Mary Ellen mine and the results of the mill now in operation are very satisfactory. The permanent and valuable character of the mine has been established. It is the property of A. B. Cruickshank. The mine is situated on the Tuolumne river. The sale of the Hunter mine, situated near the Buchanan mine, has been lately made to New York parties. The Bonita mine, located below the New Albany mine, is now the property of San Francisco parties, who propose to start work on it at an early day. Work will be resumed on the Seminole mine, near Summerville, very soon, orders having come to that effect from Mr. Bunnell, the owner, in San Francisco. Parties who know the mine well speak highly of its future. The Connelly mine, situated on the west bank of the canyon of the North Fork of the Tuolumne river, is showing well as the work of development proceeds. The results of the milling operations on the Stanley mine, near Jacksonville, have more than met the expectations of the owner and those holding bond from him. The ore bodies are of vast extent, the ore easily mined, being of a soft friable nature, and the cost of mining and milling by water power on a large scale will not exceed \$1 per ton, or less. The results in the ten-stamp mill as a working test showed a yield of \$4.50 per ton. These figures show large profits in the future. The McCormick Bros. have a good-looking piece of mining property situated on Wood creek, west of the San Geronimo mine, near this city. It is being worked by Geo. Richards and Blake Smith. The tunnel has been run for a distance of 100 feet, at which point the vein is seven feet wide. The sulphurets go \$75 per ton, and the ore yields 10 per cent sulphurets.

Yuba.

QUARTZ MINING.—Marsyville Democrat, Oct. 21: The Democrat is pleased to note the fact that there is a revival of interest in quartz mining in Yuba county. That there is to be rich and profitable ledges worked in the near future there is little doubt, judging by the latest developments in claims in the vicinity of Brownsville. There is also said to be very satisfactory prospects developing in the Brown's Valley district, where in early days a large amount of gold was taken out. From present prospects, it is safe to say that a large sum of money will be put into machinery to work Yuba county quartz mines in the next 12 months.

NEVADA.

Washoe District.

SAVAGE.—Virginia Chronicle, Oct. 22: During the week we have hoisted 522 cars of ore from the 500, 750, 950 and 1400 levels, and shipped to the Nevada mill 525 tons and milled 510 tons, average assay value as per battery samples of \$18.15 a ton. We have bullion on hand on October account amounting to \$15,706.75. The west drift from the new station, Potosi tunnel level, was advanced 29 feet, making its total length 559 feet. On the 950 level we are stopping on ore from the upraise. On the Suto tunnel level we are still working in the ledge from the main tunnel, preparatory to upraising and prospecting.

CROWN POINT.—The south lateral drift from the main west crosscut on the 300 level is now out a total distance of 184 feet. The face is in porphyry and bunches of low-grade quartz. Have stopped the drift temporarily and started No. 2 east crosscut from it, 80 feet south of No. 1. It is in 20 feet and the face is in a mixture of porphyry, quartz and clay, with considerable water running through it. Have stopped the west crosscut on the 600 level to permit the water encountered there last week to drain off.

KENTUCK.—Are now up 36 feet on the ore streak above the south drift from the north raise, 1000 level. There is no change to report over last week in its width or quality. The north drift from the Crown Point west crosscut, 500 level, has been advanced 12 feet, making its total length 57 feet.

HALE AND NORCROSS.—On the 1500 level, winze No. 2 was sunk 20 feet, making its total depth 140 feet below this level. The main incline was re-timbered 10 feet, making its total depth 248 feet. This level has now reached the Suto tunnel level, where we are now opening a large working station.

JUSTICE.—The south drift, 200 feet south of the shaft on the 490 level was cleaned out and re-timbered a distance of 62 feet during the past week; total distance 108 feet.

BELCHER.—The east crosscut No. 2 on the 300 level, in west ledge, has a total length of 127 feet; face in porphyry and low-grade quartz. Are opening out on the quartz encountered in the east crosscut on the 200 level and saving what we can for pay. The pay lies in spots through it, and the grade is therefore variable. Assays from it average from \$7 to \$30 per ton.

SCORPION.—The joint north drift, 900 level, has been advanced 17 feet, making its total length 561 feet; face in porphyry and clay. The water from the face has increased considerably and somewhat retards the progress of the drift.

SEG. BELCHER.—Have started a south drift in the quartz encountered in the west crosscut from the south lateral drift from the 500 level. It is out 22 feet and the face is in a mixture of porphyry and quartz giving low assays.

Galena District.

WOODBURY CONCENTRATOR.—Battle Mountain Central Nevada, Oct. 21: Five sacks of galena ore were tested lately in San Francisco on a new concentrator. The test was made by H. C. Reno, and the concentrator is the invention of a mining man named Woodbury. The results were so surprisingly successful that an order was immediately given to have a machine placed in position in the Bunker Hill mill, Galena. The concentrator has now been in operation about ten days, and has made a remarkable record. Mr. Woodbury was in Galena several days last week viewing his machine at work on Galena ore. It promises to revolutionize the

mining and milling industries of the camp, and already its benefit has been felt.

Pioche District.

FURNACE NOTES.—Pioche Record, Oct. 21: John Elvine has been appointed night foreman at the new smelters. The new assay office is rapidly nearing completion, and will be ready for occupancy in a few days. The new works at the smelters were lit up Saturday night by the electric light, which made everything as light as day. The new reservoir at the smelters is rapidly filling up with water. It has taken considerable time to get the ground saturated sufficiently to hold water.

COLORADO.

THE NEW LAMP.—Denver Republican, Oct. 21: Creede, the new mining camp in the San Juan country, seems to be in a very prosperous condition. Several excellent mines have been opened there, and the Denver & Rio Grande is now constructing a branch road to the town. It is one of the liveliest camps in the State, and the published accounts show that it presents many of the characteristics of a new mining town, like those that were seen during the days when the mountains were filled with prospectors, and much of Colorado was an unknown and unexplored country. The branch of the Rio Grande which is being built will doubtless be a profitable one to that company.

MONTANA.

ANACONDA AT WORK AGAIN.—Butte Inter-Mountain, Oct. 22: Mr. Daly says: The dispute with the railroad company about rates is over. Probably both companies got the worst of the fight, and both are equally glad that the end has come. Things will now go ahead as usual. Quite a number of men were put to work this morning, and more will be put on to-night. As soon as the slopes and tracks can be cleared, we shall have a full force of 1000 or 1200 men at work in the Anaconda and syndicate mines. In 36 hours we shall begin hoisting ore, and in about four days the Montana Union will be taking it to the smelter. Both the smelters will soon be in full blast, the same as they were before, with a full complement of men—probably 1400. "Have you any fuel on hand?" "Not a great deal at present, but to-morrow morning 40 carloads will start from Rock Springs, and that will be the size of the daily shipment from that point hereafter; within 12 days we shall be producing matte." At the Anaconda and Wake-Up-Jim hoists, the stars and stripes were unfurled to the breeze at an early hour, and from 7 to 9 o'clock a swarm of miners marched up the hill. There were over 1000 men in line at the Anaconda office. The mine superintendent gave it out that all the old employees of the company would be taken back first, and the names of others would be taken, and in case the old hands did not apply, preference would be given them. It was a glad scene, nothing like it having ever been presented in Butte. Men were put to work immediately, and a scene of life and activity that had not been known on the hill for many dreary months was presented.

NEW MEXICO.

A PRODUCER.—Silver City Enterprise, Oct. 27: The Mogollon country is making an enviable record as a producer of the precious metals. The country, though old, is comparatively new as a producer of the precious metals. The Enterprise has spoken frequently of this wonderful region, and has always maintained that machinery was all that was required to bring the country into prominence. We have had occasion to refer frequently to the two mines in question, the Maud S. and the Last Chance. Last week we noted the arrival of two bricks, and this week we are called upon to chronicle the receipt of two additional bars; the one from the Maud S. weighed 63½ pounds and is valued at \$1354, and the Last Chance comes to the front with 86 pounds, worth \$1621.

A BIG DEAL.—The Grand Central group of mines in Carpenter district, this county, have changed hands for the neat sum of \$1,000,000. This is the largest sale of mining property which has taken place in the Southwest for a number of years, and speaks volumes for the future of a heretofore comparatively unknown section. The success of this venture will in all probability be the means of booming the entire western slope of the Black Range country, and of opening up properties heretofore neglected. There is every reason to believe that this sale is but the precursor of others equally as large, which will follow in the near future. The property in question comprises the Alta, Washington, Grand Central and Central mines, all monster zinc-lead deposits carrying silver. Carpenter district is an extensive one, and the properties just sold comprise but a small fraction of the mineral wealth which is to be found within its limits. The recent sale will stimulate mine owners to renewed activity, and it would not surprise us to learn that within the next few months eight other large sales had been effected. Prospectors may now strike out for the hills on the western slope, confident in the knowledge that if they strike anything they can dispose of it.

UTAH.

PARK NOTES.—Record, Oct. 17: The new shaft house at the Lucky Bill is going up rapidly and will soon be completed. Sinking is going forward without interruption and the shaft is steadily growing in depth. Stock is still held firmly at good figures. Some remarkably fine ore is now being taken from the old stops in the Northland mine, and work is being vigorously prosecuted in the raise by White & MacDonald, who are driving it on a contract. Three shifts are being worked. The machinery for the Mears arrived this week and consists of 50-horse power boilers and a hoisting engine capable of sinking to a depth of 1000 feet. A new air compressor and much other machinery arrived for the Daly-West this week and was taken to the mine. Great advantage has been taken of the recent pleasant weather and the works are now nearly inclosed and the men have protection from the weather. The boiler room being erected is a permanent building and consequently everything connected with it is first class in every particular. The Daly-West is making a great stir this fall, but will make a bigger one next spring.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING OCT. 20, 1891.

461,729.—RAILWAY RAIL CHAIR-PLATE—P. Baggio, Oakland, Cal.

461,771.—WRENCH—J. O. Cottrell, Riverside, Cal.

461,751.—COUPLING—L. S. Goldman, Redlands, Cal.

461,480.—EXTENSION REVOLVER STOCK—W. L. & E. C. Kellar, Azusa, Cal.

461,615.—WHIFFLETREE CLIP AND HOOK—R. L. Kirby, Pomerooy, Wash.

461,483.—LOCOMOTIVE—J. B. Mahana, Free-water, Or.

461,763.—CAR FOR SINGLE RAILWAYS—J. B. Mahana, Free-water, Or.

461,764.—ELEVATED RAILWAY—J. B. Mahana, Free-water, Or.

461,802.—VAPOUR ENGINE—P. C. Sainsevain, San Jose, Cal.

461,451.—BOX LINING—A. Schilling, Oakland, Cal.

461,547.—PROPELLING WHEEL—J. W. Seivert, Medical Lake, Cal.

461,595.—CULTIVATOR—C. Sims, Los Olivos, Cal.

461,718.—BELL-RINGER—Slater & Barnes, Oakland, Cal.

461,513.—LUBRICANT—A. Sommer, Berkeley, Cal.

461,527.—CAR COUPLING—A. H. Weir, Los Angeles, Cal.

461,461.—STAMP-SELLING MACHINE—S. B. Whiteside, S. F.

461,725.—ENGINEER'S AIR BRAKE VALVE—J. T. Wilson, S. F.

The following brief list by telegraph, for Oct. 27, will appear more complete on receipt of mail advices: California.—Robert A. Hickok, Santa Ana, lamp stove; George W. McNeal, Oakland, electric railway; Anton and J. Michalitschke, San Francisco, handle wrapper for cigars; Robert Magler, San Francisco, truss; Theobald Scheibel, Santa Rosa, gate; Jasper S. Scott, San Jose, derrier fork attachment; John H. Southey, Stockton, rein guard; Washington—Remembrance L. Kirby, Pomerooy, running gear for vehicles; Angus J. McDonald, Blaine, household article; Martin Rosenbaum, Tacoma, combined extension show table and bedstead, Arizona.—Charles W. Blackburn, Tombstone, whiffletree hook.

NOTES.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ENGINEER'S AIR-BRAKE VALVE.—John Tyler Wilson, S. F. No. 461,725. Dated Oct. 20, 1891. A general and brief description of the usual construction and operation of the devices now in use will give a better understanding of the improvements covered by this patent. The engineer's brake and equalizing discharge valve of the ordinary type consists of a valve shell or body connected with the brake pipe and also with the main reservoir. It has within it a rotary valve provided with suitable ports, and said valve is operated by means of a handle. The valve body or shell contains other parts and devices which are unnecessary to describe, as they are the usual ones in these appliances that the invention relates to. There are several positions of the handle which have received distinctive names indicative of the operations to be performed. The first position is termed the "position for releasing the brake." The next is the position while running. The next is the position on lap. The next is the position for the application of the brake to the general train service. The final position is known as the "emergency stop," and is only used, as the name implies, when it is desired to obtain the most forcible applications of the brakes. These positions succeed one another, and are reached successively by the movement of the handle in the same direction.

Brakes are not only applied to the wheels of the cars and tender of the train, but are also applied to the driving-wheels of the locomotive. The former brakes are known as the "train service," while the latter are known as the "drive-wheel brakes." There are two ways in which they are arranged with relation to each other. One is to unite them, and in this form of connecting the brakes, whenever applied to the wheels of the train cars and tender, are also applied to the driving-wheels of the locomotive. This uniting of the brakes is found in practice to possess many disadvantages and is seldom used. One disadvantage is that the brakes must be very delicately handled to avoid a too forcible application of them to the driving-wheels, which would result in a sudden checking of the momentum, producing a shock. Another is the wear and tear on the tires of the driving-wheels, which is very great, especially on long grades, where the brakes have to be constantly applied for long distances. These disadvantages have resulted, therefore, in the adoption of another form of application, namely, the separate application of the train-service brakes and the drive-wheel brakes. This separate application requires a separate lever or handle for the operation of the driving-wheel brakes, and the disadvantage of this method is that the engineer is required to perform two distinct operations, namely, the operation of the handle of the train-service brakes and a separate operation of another handle to apply the brakes to the driving-wheels. This double operation is a severe strain upon the engineer's mind and is not likely to be performed under the very circumstances which are intended to call for its performance, namely, an emergency.

The object of the present improvement is to provide means by which the disadvantages of both the methods heretofore described are avoided, said means insuring the best results by the operation of a single handle having movements and stops precisely the same as are at present employed, applying the brakes for the train service only at the ordinary

brake-service stop and applying the brakes fully for the train-service and also the brakes for the driving-wheels of the locomotive at the emergency stop. Therefore, by the improvements, the brakes do not have to be so carefully manipulated, nor is there any wear and tear on the driving-wheels, as their brakes are only applied in cases of emergency, and finally, there are no separate operations to be performed by the engineer; but, on the contrary, the present and usual operation of a single handle is all that is required.

BELL-RINGING ATTACHMENT.—Wm. W. Slater and Harry C. Barnes, Oakland, No. 461,718. Dated Oct. 20, 1891. This is an electric attachment for ringing bells at railroad crossings or at other points where it is desirable to produce a signal or alarm; and it consists in the combination with the stationary bell, having a movable tongue or clapper, of a peculiarly constructed electro-magnet, with a direct connection between the magnet and the movable tongue. The object of the invention is to combine in an electro-magnet the advantageous points of an attracting pole and a solenoid for the purpose of actuating the movable clapper or tongue of the bell, whereby a pull of sufficient length is produced, with constantly increasing strength to the end of the stroke, and the tongue is made to strike the bell with great force just at the finish of the stroke.

Mining Share Market.

Mining shares the past week were lightly dealt in, notwithstanding the pool's efforts through cross orders to instill more life into the market so as to engineer for still lower prices. Even the chippers are gradually dropping out of the market. They are not doing much business except on orders. The downward movement of the market (10 per cent up and about 15 per cent down) is accepted as confirmatory of a report put out in last May at the time when Con. Virginia sold at \$20 a share, that the different pools had combined so as to help those controlling the middle mines to get the shares of the latter from outside holders. How well it has been done, ask any commission broker, for never within the history of the Comstock has the public held so few shares. It is said that the cry for help raised by the middle pool was due to the suit brought by the Mining Stock Association, through M. W. Fox in September of last year, against the Hale & Norcross Co.'s directors—those who have served at any time since 1886. Mr. Fox in his complaint claims that the shareholders in the mine were wronged, and asks for an accounting and the recovery of \$2,250,000 which he claims was misappropriated. In outside mining shares the Tuscaroras show more strength. The bodies were weaker through cross orders and an assessment on Bulwer. A pool is said to be concentrating these stocks. The Quijotas are lifeless.

The suit of Mr. W. Fox against the Hale and Norcross Co. (a corporation) and any individual director who has served at any time since 1886, begins to attract attention, and has considerable bearing on the mining share market. When the suit was first brought it was stigmatized as a blackmailing scheme, but as time passed and the defendants saw the systematic manner in which the plaintiff and his associates went to work to secure proofs to back their case, it became evident that it was no child's play. A stubborn fight was made against the plaintiffs having access to the books and records of the Carson Mint, but without avail. It is claimed that in examining these books and records very important information was secured of an official character, and that it is not confined to any one company. It is said also that in another way evidence was secured corroborating many of the reports of mismanagement, etc. Every step has been stubbornly fought, but the links, it is claimed, are so closely joined that it is not at all unlikely but the defendants in the suit will have to pay over a large sum of money to the shareholders in the mine. The strong bear moves, through assessments and other means, are accepted as confirmatory that the Middle pool after the stock, so that if judgment is rendered against the directors, very few outsiders will get any of the money owing to their having sold their stock.

Notwithstanding the stoppage of leaks at the mines, good news does get out, but then as the pool or pools break, through cross orders, the market outsiders think it is "all hosh," forgetting that this is the way insiders have of throwing discredit on favorable news when buying stock. The situation at the mines warrants much higher prices for the Comstock shares. The mines from one end of the lode to the other have been opened up on the various levels from the grass roots down to the Suto-tunnel level, and therefore they are in better shape than ever before for the extracting of the good to high grade ore to the west. Official and semi-official reports state that ore ranging from six to eight feet wide assays quite high—high enough to make the entire west lode workable at a good profit. In Con. Virginia fair progress is being made to develop for extracting the downward continuation of the ore from the levels above, out of which so many dividends were paid. Those in position to know claim that dividends will be resumed as soon as the company begins to extract the ore from the 1800 up to the 1600 foot level. From Hale and Norcross and also from Savage, the work under way is of a very encouraging character, and it will result in getting those two and also adjoining mines into better working condition for extracting at lessened cost the high-grade ore to the west. Important work is under way (but kept secret) in several of the Gold Hill mines. Before the favorable results are made public, another line of assessments will probably be levied to frighten outside shareholders into parting with their stock. The work in Ophir, Mexican, Union and Sierra Nevada bears close watching—the shares are being concentrated, and when better held by the pool, it is in order to spring good news on the public.

From all the outside mines more favorable news is being received, yet outside of the Tuscaroras the shares do not show it.

Mining shares opened this (Thursday) morning at lower prices, under a strong bear raid; after Call prices went still lower under outside selling, but toward the close they began to strengthen. The market is undoubtedly a buy at to-day's prices, and any one who buys and pays cash will make considerable money before the close of the year. The points out are for slightly lower prices before the big deal sets in.

MECHANICAL PROGRESS.

Influence of Zinc on Steel.

In connection with the bursting of a gun on board an English vessel, attention is being directed to the characteristics of certain qualities of steel. A correspondent of *Ironmonger* holds that steel is liable to be changed by the action of time, unaltered by any external, mechanical, or chemical influence. In support of his view that time alone appears to be sufficient to produce these changes he cites several examples of failures which have occurred within his own experience. At one of the engineering establishments in London a number of flat steel plates cracked spontaneously, with loud reports, several months after they had been received, and without any work having been subsequently done to them.

Some solid steel armor plates, supplied to a Continental navy, are said to have failed in the same way, and others from the same batch cracked on being tested by dropping. Numerous boiler plates have cracked after the boilers had been at work for years, and weeks after the steam pressure had been reduced and the water run out, and this, too, in spite of the fact that every boiler is tested to double its working pressure when new. Another instance is the cracking of hardened armor plating steel shells several months after they have been delivered to the authorities. This is attributed to the alter effects of the hardening process, but if these were independent of time the shells ought to crack during the operation or not at all.

At the May meeting of the British Iron and Steel Institute, Dr. Anderson, of Woolwich in a paper on the "Tests for steel used in the manufacture of artillery," dealt with the question in a very interesting manner, and the paper showed that the peculiarities mentioned are caused chiefly by the unequal tension of the metal, whether caused by the process of oil-hardening or in some other manner.

The metal may remain for a long time in this strained condition, and then a slight change of temperature, or some other relatively slight cause brings about a rupture. To obviate the risks thus incurred is a task not beyond the skill of metallurgists; but even after science has had its full play and chemistry its fullest functions it may be that the influence of time will deserve consideration. It is well known, for instance, that some cutlery firms prefer to keep their cast steel ingots two or three years before working them up, because experience has demonstrated that the steel is improved thereby.

MAKING TOOLS FROM SOFT STEEL.—It is asserted by the new, or Dalziel, process of treating steel, any of the ordinary steels of the usual lengths and shapes for making tools, punches and dies will, when treated, become soft as to effect a most material saving in the cost of making the desired tool; after having been softened and cut to the required form, the steel is handled in precisely the same way as any of the well-known sorts, and it is claimed that the process in no way affects the chemical composition of the metal, but so alters its physical structure as to impart the qualities mentioned. In proof of this, a piece of Jessup steel, which had been softened by this method, was made into a punch to cut a five-pointed star, seven-eighths of an inch in diameter and unusually sharp at the points, the result showing that in the making of this punch a saving of about 20 per cent, was effected in the cost, owing solely to the softness of the metal. After being cut it was tempered in the usual way in water, then forced through German silver 3/32 inches thick, also through wrought iron 3/16 inches thick, and as a final test was forced through metal which cut only a part of the star, thus giving an unbalanced pressure tending to heat the punch. It was given a series of tests in this way, not only unusual, but which would not be resorted to except under instructions to pass from one test to another more severe; in this case the tool came out at last as perfect as when it originally left the maker's hands.—*Carriage and Wagon Maker*.

NICKELIZED STEEL FOR SHIPS.—Writing from Halifax, Nova Scotia, to the *London Economist*, Mr. Peter Imrie predicts that Canada will eventually control the ship-building industry. It is now practically proved, he argues, that steel mixed with from three to five per cent of nickel is double the strength of ordinary steel, and that it does not corrode or take on barnacles, so that ships constructed of it will never require scraping. Moreover, as ships of nickelated steel may safely be built much lighter than ordinary steel ships, their engine power and consumption of coal may be safely reduced without diminution of speed. In short, nickelated steel seems bound to supersede ordinary steel, and probably also all other materials in present use in ship construction. Nickel has thus become a necessity, and the nation which is in a position to produce this material must necessarily control the ship-building trade. And, for the present at least, there is no known supply of nickel worth mentioning outside that of Canada. Canada possesses nickeliferous pyrites without limit. The entire lake region extending from Lake Superior to Labrador is rich in it. Experts declare that the Dominion can supply a million

tons of pure metal annually, if necessary, for an indefinite period. All the other sources of supply known in the world just now would not suffice to keep even a single first-class ship-building concern on the Clyde in full work.

FIRST USE OF IRON FOR STRUCTURAL PURPOSES.—Accustomed as we of to-day are to look upon iron as one of the most common as well as essential elements in the construction of almost everything, from the tiniest needle to the ponderous railroad bridge or magnificent building, there was a time when its use for structural purposes was looked upon with suspicion and distrust. There is standing to-day in England the first bridge ever built of this material, and it is in constant use notwithstanding the fact that it has stood the strain of travel for over 100 years. This old bridge spans a little river between Worcester and Shrewsbury, and was built in 1778. It is about 96 feet long and weighs 378 tons. Stephenson, the great engineer of his time, says of this bridge: "When we bear in mind that the manipulation of cast iron was at the time of its erection in its infancy, we cannot help but feel convinced that unblushing audacity alone could conceive of such an enterprise, and the intelligence with which the details are outlined and executed is equal to the boldness of the conception."

THE WAY TO SOFTEN STEEL.—A correspondent of the *Blacksmith* furnishes the following method for softening steel: Make two iron moulds a little larger than the piece of steel to be softened. Fill them with clay, imbed the steel in the clay and close the mould by winding a piece of wire around it to exclude the air. After heating the whole to a red heat, thrust the moulds among the coals, or in the ashes to cool. The steel will then be soft enough to be cut with a knife, as your correspondent desired. Another correspondent tells how to make a neat weld by heating the rim twice. That does very well, brother smith, but I begin my welding with the iron at a good welding heat, strike fast and hard and manage to turn out a fair job with only one heat.

METAL RAILWAY SLEEPERS IN RUSSIA.—An attempt is being made to introduce metal sleepers upon all the railways in Russia, says the *Ironmonger*. An experiment was made some time ago with sleepers of native make, when it was found that the only drawback was their cost. These experiments are now to be resumed upon an extensive scale, and contracts have accordingly been placed by the government with native makers for a large supply. If the trials should result in a general adoption of metal sleepers it is evident that an enormous impetus will be given to the Russian metallurgical industry, since it is estimated that there is in use 60,000,000 sleepers of wood that have to be renewed at the rate of about 13,000,000 yearly.

TO PREVENT SCREWS FROM BECOMING FIXED.—To prevent screws employed to join machinery from becoming fixed and difficult to remove from oxidation, the *Monitor Industrielle* recommends a mixture of oil and graphite, and says it will effectually prevent screws from becoming fixed, and protect them for years from rust. The mixture facilitates tightening up, and is an excellent lubricant, and reduces the friction of the screw in its socket. Carbon, of which graphite is largely composed, is the best known lubricant.

CASE HARDENING.—Prof. Elihu Thomson has recently devised a method of case-hardening iron or steel by means of the heat produced by the passage of an electric current. His process consists essentially in heating the object electrically, and then applying to the metal so heated a surrounding envelope—either gaseous, fluid or solid—for the purpose of changing or preventing change in the quality of the material, according to the special end to be attained.

WELDING.—To weld two rods of iron together so neatly that an expert cannot discover the weld, is done in the following manner. First chamfer the ends, then weld them together and then stave them up until they are considerably larger than the other part of the rods. After that take another weld and draw to a uniform size, and the job is neat and complete.

AN IMPROVED STAIR TREAD.—A new English pattern of stair tread is made of alternate strips of lead and steel, the lead furnishing foot-hold and the steel preventing wear. The lead is cast in grooves in a plate of steel, and it is claimed that this form of step has unusual durability, and will not wear smooth under heavy travel.

THE LATEST DEVICE in the way of a wood pulley for a shaft has only one arm to support the hub from the rim. This must give all the room that is wanted to remove a split wheel, and makes quite a contrast from the one that must have been built at a bicycle factory, for the spokes, as well as the rim, were composed of wire.

A NEW PROCESS for desulphurizing pig iron has been perfected by an inventor at Horde, Germany. Its practical operation is said to be fast winning it a reputation, and already a number of extensive works have applied for a right to use it. We are not informed as to the precise nature of the process.

SCIENTIFIC PROGRESS.

Electricity and Life.

Experiments that have a Suggestion Bearing Upon their Relation.

It seems to be a pretty well established fact, writes Edward P. Jackson in the *North American Review*, that electricity may be made at least a powerful stimulant to the growth of plants. May it not be more than a mere stimulant? May it not be an actual creator of life? Beans, rye, corn, oats, barley, peas, potatoes, sunflowers, clover and flax have all been experimented upon, in some cases with astonishing results. In one series of experiments the seeds were electrified before they were sown; in another, currents were maintained through the soil in which they were planted; and in still another, through the atmosphere immediately above the plants. In several instances the yield of fruit was enormously above the average, and in all, the growth was unusually luxuriant. Further experiments are in progress, and it is not unlikely that science is about to add another to her long series of beneficent triumphs, another refutation to the creaking philosophy of Malthus and his disciples.

The results of the experiments have, furthermore, a suggestive bearing upon the relation between electricity and that inscrutable something which we call life. If they do not prove them the same, they at least bring them nearer together than any phenomena which have preceded them. When, in the healing art, enfeebled vitality is restored, either wholly or in part, by the skillful application of electricity, nothing is positively demonstrated beyond mere healthful stimulation, the mere awakening of life which already lay dormant in the system, such as might possibly have followed the use of other remedial agents. But here it is not morbid life restored to normal conditions, not dormant life reawakened to action. It is apparently the actual development of vitality not pre-existent in the perfectly healthy and normal organisms under treatment. Electricity itself appears to be converted to vitality, as elsewhere it is converted to light, heat, and mechanical motion.

Whether life can thus not only be renewed but actually transfused into the veins, or rather the nerves of man, remains for physiological science to determine. It has already been shown that a living body is a species of thermoelectric battery, of which the ectoderm and the endoderm are the opposite poles; that the exhilarating effects of a cold plunge, for example, are due simply to the increase of potential from the reduced temperature of the "cold" electrode. But merely setting a battery into operation, or merely increasing its action, is not increasing its inherent voltage, which is what the recent experiments seem to have done for plants.

But do not heat and the active principle of light artificially intensified produce similar effects? The forcing of vegetable growth in hothouses is an old process, not unlike the one in question both in method and effect. According to the reports given, however, there is a very great difference in the results attained. If this be true, it would seem to indicate more strongly than ever that of all forms of natural force, electricity bears the closest relation to that mysterious form of it which we call life.

Latent Electricity.

A correspondent of the *Practical Mechanic* remarks as follows upon the question as to whether electricity in the atmosphere can be readily carried off by means of conductors and subsequently grounded.

"Judging from past experience and recent experiments it is evident that electrical currents sometimes are so powerful that the wires hardly seem to be able to carry the load, and that consequently more or less electricity 'escapes' and remains suspended in the atmosphere, which then has the same effect on the observer as exists previous to the occurrence of a heavy thunder storm."

That this condition of affairs can seriously effect low-tension currents has been satisfactorily proven, and efforts have been made to counteract these effects or rather prevent them by different means. In Paris, France, the subways in which the electric wires for lights, power, telephone, etc. are laid, it was found advisable to establish more ventilators than were at first proposed, in order to secure perfect ventilation and this fact alone serves to verify the theory that electricity in suspension existed to an extent which was damaging to the low tension currents carried by the unenclosed and unprotected wires.

Pyrotechnical displays have and are often witnessed between high and low-tension wires, when the atmosphere is heavily charged with electricity, and it has also been found that in the vicinity of water the air is purer than in other places. The conclusion therefore seems justified that water absorbs latent electricity quite readily.

In electric subways, of course it is not expedient to have water-pools since by virtue of evaporation the air would always be in a more or less moist condition, and this would counteract the gains as to purity. At any rate it is proven that electricity in its latent form can be collected or rather absorbed by proper substances, and if we take into consideration

that probably in the near future all electric wires, both high and low-tension, will have to go under ground, the field for inventors is open to design and construct a sub-way in which good ventilation, freedom from danger by induction of electric currents and readiness of access are the features."

RED STAINS ON COPPER AND BRASS.—Red stains often appear on copper and brass ware which sometimes cause considerable loss in the depreciation of such articles in store. Prof. Turner of Birmingham, England, has recently been studying into the cause of this phenomenon, with the view of devising some means to prevent its occurrence. The workmen usually ascribe these stains and spots to burning, sulphur, furnace dust and dirt, and are sure that the stains pass through the whole mass. Mr. Turner found none of these views correct and the stains confined to the surface; nodules were never observed. Finally, he evaporated water, salt water, pickle and dilute acids on the surface or wrote with such ingredients on the brass; then he did obtain stains, especially when chlorides had been used, but not with zinc chloride. The conclusion is that chlorides attack the zinc and liberate the copper; zinc chloride cannot do this. The stains are therefore caused by the water being allowed to dry on the material after washing upon completion of pickling. The brasses themselves Mr. Turner found very uniform. This trouble seems to be unusually annoying in the city of Birmingham, and the Professor says that as the water of that city is notoriously impregnated with chlorides, that fact accounts for the excess of the trouble in that locality.

STORM PREVENTION.—While some of the scientists in this country are busily engaged in devising ways and means to produce rain, their fellows on the other side of the Atlantic are equally busy in devising some means for preventing such phenomena. It appears that around Tarbes, a district in France, there have been for many years a number of destructive hail and rain storms which have caused a serious damage to the crops and vineyards. The storms are very sudden, and as they are always of a violent character, the peasants work under discouraging circumstances. Recently, the director of the observatory on the Pic du Midi thought of a means of averting these frequent disasters, and so he arranged a series of high poles on the hills about the unfortunate district, and these poles were surmounted with metallic caps and connected with wires. The director hopes in this way to cause a lessening of the electrical tension of the clouds, which he thinks is the cause of the storms. Both classes of experiments are being watched with interest by scientific men.

CLOUD PHOTOGRAPHY.—Many remarkable data of immense value in the preparation of weather forecasts have lately been secured by cloud photographs. The range of observations extended from clouds floating less than one and one-half miles high in air moving at seven miles an hour, to nine miles above the ground in gales blowing 65 miles an hour, while the surface wind was only a gentle breeze of five miles an hour.

THE PLANET MARS.—M. Flammarion, the French astronomer, has suggested that in Mars they are much more advanced, intelligently speaking, than we are ourselves, and that they may possibly have optical instruments which excel ours as much as the Lick telescope surpasses a piece of colored glass. Mars is an old planet, very cold now, but one which has passed through all its hot periods.

COMMON TURPENTINE AND LARCH TURPENTINE.—If a few drops of common turpentine in a test tube are covered with five parts ammonia of specific gravity 0.96, the turpentine forms a milky emulsion and soon gelatinizes. Larch, otherwise known as Venice turpentine, remains apparently unaffected, but if constantly stirred up it becomes a solid, colorless mass.

AN INDUSTRIOUS COLLECTOR.—G. W. Dunn, the California naturalist, has collected over 70,000 insects belonging to the horn-winged family, 5000 of the oricket tribe, about 4000 butterflies and numberless rare plants and animals. On his last trip through Lower California, he caught 200 insects of the Ciendela Sonimer in two hours, for which he received 25 cents each.

ELECTRIC PUSH BUTTONS FOR STREET CARS. The cars on the new cable railway in San Diego, Cal., have electric push-buttons instead of the troublesome dangling straps, with which to notify the gripman when to stop the car. Dry batteries are used for the electric bell service, and they are said to be less troublesome than replacing broken straps.

A NEW MOTOR, utilizing ordinary gas as well as petroleum, is announced compact in form, requiring little space and no expensive foundations or attendance. In a half-minute's time starting can be accomplished.

INSTANTANEOUS PHOTOGRAPHY has been used to record the movements of the lips in speaking, and by putting the photographs in a zoetrope a deaf mute can easily read the words.

LATE DEVELOPMENTS in electro-photography indicate that it may be possible to take photographs of views located many miles from the camera.

ELECTRICITY.

Transmission of Electrical Power.

What May Be Expected from Electricity in the Early Future.

The most interesting and important feature in recent electrical progress is the improved system of conveying electrical power from Lanfen on the river Neckar, in Germany, to the city of Frankfurt, a distance of 110 miles. This power is used at the great exhibition now in progress at Frankfurt, both for driving machinery and for lighting up the exhibition buildings. We have already, in our issue of last week, made reference to this matter; but as the interest in the enterprise grows deeper, with its continued success, and the vast possibilities which it opens up to the cheap production and ready and economical transmission of electrical power, we shall probably have frequent occasion to refer to it in the future.

As is well known, there is not, as yet, any known way for economically producing electrical power except through the intervention of some other agency, as steam or water power. Steam has heretofore been generally employed to generate the electricity, the latter being simply, used as a distributor or "belt," to carry the power from point to point where it may be needed. But this mode of transmission has heretofore been attended with a large percentage of loss, especially if the distance over which it has to be transmitted is very great. In some localities it has been convenient to employ water power instead of steam as a generator. Ordinarily water has a great advantage over steam in point of economy, but the percentage of loss has been so great that until very recently no attempt has been made to transmit the power generated more than four or five miles. Even that has been attended with a loss of 40 per cent or more. Moreover wires carrying such a strong current through a country have been exceedingly dangerous—a break in a wire by which the broken live end might come in contact with the ground would be sure death to any person or animal coming in contact with it.

The New Mode of Transmission Is Perfectly Free from Danger.

By the improved mode of transmission adopted between Lanfen and Frankfurt the element of danger from a broken wire is absolutely removed. Except by a carefully prepared diagram and quite a technical description, the manner in which this is done cannot be made intelligible to the reader. But it is done, and the operation of the whole apparatus of 300-horse power is made as safe as that of an ordinary telegraph battery and line. Moreover, the percentage of loss of power, which has heretofore reached 40 per cent or more in five miles, is reduced by this new method to only 25 per cent in 110 miles.

This powerful current is sent across the country, traversing one of the most populous regions of Europe, on those small copper wires, each about four millimeters in thickness, and strung along poles about 25 feet high. These wires are not covered with any insulating material, but are entirely bare. A portion of the current goes to the electric lighting apparatus, furnishing a current for 1200 incandescent lamps. The rest of the current goes to three motors when it takes the form of mechanical energy and drives machinery. This result, at last accounts, had not only been attained, but it had also been constantly maintained fully two weeks, and no doubt is entertained, but that it will be as permanent as any other power which can be introduced for similar work.

The Greatest Engineering Feat of the Age.

This may be considered one of the most important engineering enterprises ever successfully devised and carried out by man in any age of the world—and one promising greater benefits to human industry than has ever before been accomplished by any one step of progress.

We can conceive of only one greater possible step in the future—that of obtaining electricity direct from the combustion of coal. And even this has been promised us by that most successful and untiring inventor which the world has ever produced—Thomas A. Edison, who has never yet put his hand to anything without eventual success. When Edison says a thing is possible—especially in his own chosen field of research—it may set down as something to be implicitly depended upon.

Its Effect on California.

The announcement of the complete success of this undertaking is exerting a most beneficial effect upon capitalists in this State, many of whom have been for a long time waiting with intense interest the outcome of this German enterprise. It indicates what may be expected in the near future from the unlimited amount of water power now running to waste all along the foothills of the Sierra Nevada and the Sierra Madre which extend for a distance of some 500 miles along the Eastern border of our State. The experiment at Lanfen has proven that the power of those streams can be carried all through our great valleys and made far more economical than steam, not only for driving machinery, but for operating railroads as well. The people of Sacramento and vicinity; of Stockton and all the growing towns of the San Joaquin, and the upper Sacramento val-

leys, as well as those of the San Gabriel and San Bernardino valleys, and those still farther south are already agitating the value of their neighboring water falls, and laying plans for their early conversion into useful purposes connected with their various industrial needs and possibilities.

The achievement which has been reached by German engineers is equally possible in all the localities referred to. Turbines set in any of our mountain streams may generate an immense power at a trifling cost which may be economically carried to the towns and cities of the neighboring valley, distributed indefinitely, and made to do all the work of costly steam engines, which have to be fed by coal at a cost two and three times that demanded in the Eastern States. We are fully persuaded that the successful result reached in the experiment at Lanfen will mark a new era in mechanical science.

Electric Roads for Farmers.

One of the possible chief benefits to be derived from electric roads in the early future will probably inure direct to the farmers throughout the country. With the cheap production of electricity actually achieved in the Lanfen experiment alluded to in another column, to say nothing of the still greater reduction foreshadowed by Mr. Edison's repeated assertions that we shall soon be able to produce electricity direct from coal, the time will soon come—nay, is already at hand—when railroad propulsion by electricity will be so much cheaper than by the present use of steam that all our chief rural wagon-roads will be converted into electric railroads. Of course the farmer, more than any other class of producers, is benefited by railroads as they now exist in getting his products to market; but an equal advantage may also be gained by the use of minor roads in getting his produce from the farm to the various stations along the line of the great roads.

In regard to this matter, we would call attention to the following paragraph from a late number of the *Electrical Engineer*: "The use of electric roads for farms is destined to be enormous. At the present time, the state of the vast majority of our rural highways is such as to render transportation a frightful tax upon production. But nothing is easier than to track and wire these roads, furnish them with motor trucks upon which the farm wagons can be run fully loaded, and then turn on the current at stated intervals from the power-houses in the nearest town or at the nearest water-power. These electric roads will continue running through winter and spring months when the ordinary dirt roads are utterly impassable and when the multitude of draught horses kept by the farmers are simply eating their heads off in idleness. In 1880 there were 2,000,000 such horses on American farms. The bare possibility of getting promptly to market will stimulate the farmer to cultivate crops that now he dare not dream of. Moreover, the speed made will effect a most tremendous economy in the farmer's time.

Edison's Latest Invention.

Pertinent to the above, we would call attention to Edison's latest announced invention of a street-car motor, which is in direct line with the construction and operation of "Railroads for Farmers." Mr. Edison, in speaking of this invention to a newspaper reporter, said that he would move his cars with motors, but not by means of a storage battery. The current was to flow along the rails, and be picked up by the car as it moved. It could be picked up through two inches of mud. The current was absolutely safe from harm to any person coming in contact with the rails. His experiments were already completed, the invention was "a go," and a large company, after full investigation, had determined to introduce it on their road. In alluding to the control and picking up of the current, he remarked that it was a very difficult thing to work out; but he had finally perfected it and that it was "a very peculiar thing." In regard to economy, Mr. Edison assured his interviewer that the cost of running a car by his new system would not be more than one-third the cost of running a cable car. We give the report as we find it. It purports to come directly from Mr. Edison to a New York *World* interviewer. The claims set up by Mr. Edison appear to be almost too much to believe; but, with the strides which we actually know are being made in utilizing this new power, it would be quite as rash to say we do not believe as to say we do believe.

THE CROUCH SAFETY DYNAMO.—A large share of electrical inventions seems to be just now devoted to rendering electricity, in all its uses, safe from danger. We have already, in this issue of the PRESS, spoken of the safety devices being introduced by Mr. Edison, in regard to running electric cars, and now we learn that a safety electric-lighting system, invented by an Oregonian, is being introduced into Salem, Oregon. We copy from a contemporary as follows: "The Crouch-Houston Electrical and Manufacturing Co. of Eugene to-day filed articles of incorporation with the Secretary of State. The capital stock is \$1,000,000. The object of the corporation is to manufacture and sell the Crouch safety dynamo. This is the invention of a Eugene man—F. J. Crouch—and promises to revolutionize electric-lighting. Live wires are rendered harmless by this system.

GOOD HEALTH.

The Use of Pillows.

A pillow is a necessity; but care and judgment should be exercised in its use. No mere matter of habit is the use of a pillow. It has a physiological basis. We sleep, for the most part, on the side, and without a pillow the head would be uncomfortably and harmfully lower than the body. It will be remembered that Jacob, when fleeing from Esau, took a stone for a pillow. He needed something for the purpose, and nothing better than a stone presented itself. Such practices are common in Africa at the present day.

Some people rest the neck instead of the head on hard pillows. In Africa extraordinary headgears make this practice necessary, and many a civilized woman has been compelled by a somewhat similar culture to forego both the pillow and the recumbent posture. The consideration of the physiological reasons for pillows will suggest their proper thickness. They should merely bring the head to the normal level. Some pillows are much too thick. By bending the neck unduly they interfere with the outflow of the venous blood from the head. The pillow that just fills up the space above the shoulder best suits its end.

Again, pillows of feathers are objectionable. While they furnish the needed support for the head, they are too heating, as they have a remarkable capacity for holding and accumulating heat.

It should be remembered that more blood, and hence more heat, goes to the head than to any other part of the body. Head-heating pillows are against the wholesome maxim, "Keep the feet warm, but the head cool." There is nothing better than the hair pillows.

Further, the pillow is for the head, not for the shoulders. To rest the shoulders on the pillow defeats the very end for which it is used.

Finally, special care should be taken of infants in this matter. We have seen their heads sunk deep into the softest and thickest of pillows, and their faces, as a natural consequence, covered with great beads of perspiration. It is no wonder that children so treated die.—*Youth's Companion*.

TEA-EATING AND LEPROSY.—It was stated some time since in the *Examiner* of this city that the daughter of a well-known tea-broker of San Francisco was for some time a sufferer from that dread disease, the leprosy. She was in the habit of eating the tea without cooking, and it is thought she may have taken the disease into her system in that way. It is said that she has lately recovered, through immersion in oxygen gas diluted with air. She was also made to breathe the gas through a tube. These oxygen baths were kept up for about a month, when her skin became white like snow. This case goes on the record as the first one of leprosy that has been cured, and her attending doctor has been asked to explain his treatment to the County Medical Society. The permanency of the cure has yet to be established. It is thought that the oxygen burned to death the microbes of the leprosy. The doctor had endeavored to cure the leprosy by injecting the bacilli of cancer, which he claimed to be a deadly enemy to the bacilli of leprosy, but it did not prove successful. Possibly the oxygen cure may revolutionize the treatment of this terrible disease.

DO CATS CAUSE RINGWORM?—One of San Francisco's dailies recently published an article saying that ringworms were largely caused by cats. This troublesome skin disease usually attacks children, and the paper aforesaid claimed that it was largely caused by the fact that children were very fond of kittens, and that the little pets were very often covered with certain fungi or parasites which, when brought in contact with a human being's skin, act similar to poison oak, although the eruptions are of a different character. It was asserted by a certain physician that in every case when ringworm had made its appearance in his practice, there was always a cat or a kitten in the household. Very likely; and how many households can be found containing children where there are no cats or kittens? The fact adduced is hardly sufficient to condemn the feline pet, and we hardly think, until a better reason for their banishment can be adduced, the children will still continue to pet and fondle the dear little Maltese or Persian kitten.

PHOTOGRAPHY AND TUMORS.—It is said that the location of tumors on the brain can now be detected by instantaneous photography. A tumor on the brain causes violent spasms by pressing on a nerve center, and while the patient is in the midst of a spasmodic attack, he is photographed, the nerves affected determined by the contortions shown on the picture and the tumor located.

PETROLEUM AND SKIN DISEASE.—It has been noticed in France that those persons engaged in cleaning out the apparatus used in refining petroleum are subject to a skin disease resembling the cancer of chimney-sweepers.

The use of the electric light has been found to materially reduce the amount of illness in factories which had previously used gas or oil for lighting.

USEFUL INFORMATION.

TAKING A PLASTER CAST FROM LIFE is very unpleasant for the person operated upon, and especially when the face is molded, the pain is considerable. The face is first greased well with vaseline, the eyelashes and eyebrows being well buried in pomade or clay, and the small hairs well smoothed down. Whiskers, etc., should be well coated with clay. Quills are inserted in the nostrils for respiration. Then when the patient is lying in a recumbent position, the plaster is laid on. The patient must not move until the plaster is set. The plaster is mixed with warm water, as the plaster sets better than with cold water. When the cast is sufficiently set, it is removed. This is the painful part of the operation. A hand can be done by thrusting it in a basin of plaster, then placing it on a towel in a desired position. As the plaster sets, lay a strong thread on the wet plaster along the hand down the middle finger. A second thread may be laid from the wrist to the thumb. The object of these threads is to make divisions in the mold, and thus enable the hand to be withdrawn. Now lay on the plaster over the whole to a sufficient thickness. When it is nearly set (still soft and wet), take the ends of the threads, and by jerking them sharply through the plaster, sections are made in the mold. In a few minutes the plaster is hard, and the mold may be burst asunder at the divisions cut by the thread and the hand released. Fractures which will probably occur must be cemented carefully in their places, after they are dry, by a solution of shellac in alcohol.

IS QUARRYING MINING?—Mr. J. B. Atkinson, president of the Mining Institute of Scotland, in discussing in his presidential address the operations of mining, makes a distinction between quarrying and mining that is not generally observed, if, indeed, it is accepted. Mining he defines to be the extraction of mineral from the earth by underground operations and the placing of it on the surface; quarrying, the extraction of mineral from the earth by surface operation. We hardly think that this distinction can be maintained. There is open cut and underground working in mining, but both are mining. It is as much mining to mine iron ore in open cuts as in underground workings. There is not the least difference in the operations in one case from those in the other. The production of the ore in the quarry or in the underground workings is in either case mining.

THE FILAMENTS IN AN INCANDESCENT LAMP. It may not be generally known that the fine filaments over which the electric current runs in an incandescent lamp are, in many cases, made of split bamboo. The preparation of these filaments is quite an art in itself. Each operative is given a small bundle of bamboo splits of less than 1-16 inch cross-section, and these are drawn through a series of fine holes until shaven down to the required size. The bamboo is then quite pliable and easily bent into the peculiar twisted form as seen in the lamp. In this condition it is carbonized and is then ready for the lamp and electric current. Different companies use different methods. The Thomson-Houston use the bamboo filament; the Westinghouse, a prepared substance covered with lampblack.

WHAT IS A "LIMITED" TRAIN.—The following is given as the definition of a "limited" train: First, it is limited as to its time. Second, it is limited as to the number of cars and weight of train. Third, it is limited as to the class of cars. Fourth, it is limited as to the number and class of passengers permitted transportation thereon, this last limit being adopted so that every passenger may have ample accommodation and not be crowded or interfered with by other passengers. The fact that an additional fare is charged on a limited train, and further, that nothing but first-class tickets are accepted for passage, tends to limit the class of travel which is carried.

THE COMMERCE OF ENGLAND AND THE UNITED STATES COMPARED.—Since 1860 the commerce of England has increased less than six times, while that of the United States has increased more than six times. England's export trade has increased four times; that of the United States eight times. From the third producing power of the world we have risen to the first. Previous to 1860, our exports amounted to \$9,000,000,000; from 1860 to the present time they have amounted to \$14,000,000,000.

ALUMINUM BUTTONS.—A decided novelty in buttons are the aluminum. This metal is highly polished and made to resemble silver, and has the great advantage of holding its color. These buttons are great sellers but are now only made in small sizes and used mainly for children's clothing. They job at from \$1.50 to \$2 per gross. They look exceedingly nobby on navy blues, and, in fact, on all dark shades of boy's clothing.

WHERE THE SUN NEVER SETS.—It has long been the boast of Great Britain that here is the only realm on which the sun never sets. The boast is a false one, or has been such since the purchase by the United States of Alaska. When it is 6 o'clock P. M. at the westernmost of the Alaskan islands, it is 9:30 A. M. the next day on the eastern boundary of Maine.

Passing Events.

The starting up of the Anaconda copper mine, Montana, is an important event for the section around the mine, as so many men are given employment. The differences with the railroad, which caused the close-down, have been arranged temporarily at least.

The sale of an important mine in New Mexico, for a large price, is an encouraging feature for that Territory. There are numbers of good properties in New Mexico that only need capital to make them productive. The presence of a few large companies will attract others.

The Trans-Mississippi Congress at Omaha has brought prominently to notice the difficulties miners have to contend with in working mines on railroad grants. It is a subject the Government should at once give attention to, otherwise much mineral land will go into the hands of railroad corporations.

R. P. KEATING, superintendent of the Hale and Norcross mine, was served with a subpoena to testify in the Hale and Norcross suit, but he left the State for Nevada, and the court has issued a bench warrant for his arrest.

River Dredging.

For some reason, we have not been successful in dredging the river beds for gold in California. Several dredges have been built and tried with no success. Several forms have been tested, suction pumps seeming to have been the favorite. This plan was even tried on the coast, near Gold Bluffs, on ocean bottom, but failed to bring up any gold. A great deal of money has been expended at different times in the northern rivers of this State, with no results. The dredges brought up dirt, gravel, etc., but little gold. One reason given, is the presence of boulders and rocks, and another, the presence of too much fine sand. At all events, the principal reason of failure has been too little gold. Over in the Carson river, Nev., for some years experimental dredging operations have been going on for net tailings and quicksilver, but as appears further on, no success of moment has been met with and the plans have had to be radically changed.

One strange feature of these failures is that the same kind of work has been successfully carried on elsewhere. In Australia numerous dredges are at work on river-beds and making money. One of the latest put at work in Victoria, Australia, is a dredge made in California. But other firms have done passably well there, while none have been successful here.

As to the Carson river, Nev., scheme, the Virginia Enterprise says: Some new plans have been formulated for the working of the tailings in the bed of the Carson river by the Rae Dredging Company. Mr. Rae was on the Comstock yesterday, and concluded a contract with A. J. McCone of the Fulton foundry for machinery for a mill to be erected at Dayton for the reduction of tailings. The first Rae dredge was provided with suction pipes for the purpose of raising the tailings from the bed of the river. The pipes became clogged, however, and the process proved impracticable. On the dredge now in use, scoops do this work. Another improvement is to be made also. The boat containing the dredging machinery is to be done away with. A railroad is to be built on the river, and the machinery placed upon a car which will run upon it. The tailings are first to be concentrated and then milled. The preparations now being made insure at least a fair test of the dredging proposition, and if results are satisfactory, a new industry of considerable proportions will have been established on the Carson river.

California and the World's Fair.

The California World's Fair Commission has, in the past few days been receiving communications from the various departments asking that California make application for space in the department buildings. As the secretary of the Commission cannot make any demand for space until the Californians who intend to exhibit have made known their intentions, it is essential that intending individual exhibitors make application to the local Commission immediately for the space which they require. Blank applications have been printed for this purpose and they will be sent to any one who asks for them. Applications from the various States for space in the department buildings have been coming in very rapidly, and for this reason the Commission urges exhibitors to lose no time. Some applications have already been received by the local Commission which have been attended to, but they are not very numerous.

As to a mining or mineral display, as far as we have learned, no concerted action has yet been taken by mining men. The State Mining Bureau will doubtless contribute typical specimens, etc, but no one is making a special collection, as has been done at previous World's Fairs.

More important, however, than a display of minerals would be a complete display of the various gold-saving appliances invented and manufactured in this State. In both quartz and gravel mining appliances, California has introduced a greater number than the other States combined. The question is, Who is to start in on such a collection? Individual inventors would be only interested in their own inventions. Some one should be suitably paid to arrange for such an exhibition, which would attract much more attention than any mere collection of ores and minerals.

Electric Drills for Mining.

The rapid increase during the past few years in the number and magnitude of applications of electric power transmission to commercial uses in this country has been due principally to three causes: First, the ability and enterprise of those who have been identified with the progress of electrical industries since electric illumination became an economic fact instead of a laboratory experiment; secondly, the readiness of the American people to adopt new and advanced methods as soon as their superiority had been fairly demonstrated; and, thirdly, the economy and flexibility of the apparatus employed, when properly designed and constructed and installed under suitable conditions.

There have been, however, some financial and engineering failures inseparable from such rapid development, the natural result of too implicit faith in electrical omnipotence. Still the pioneers of electrical inventions have received prompt and plentiful financial support, which has enabled them to inaugurate undertakings of exceptional magnitude.

Mr. H. C. Spaulding of Boston, Mass., read recently before the American Institute of Mining Engineers a paper on "Electric Power Transmission in Mining Operations," and we are indebted to him for the use of the engravings accompanying his paper. It is his object to present briefly some of the work already done toward the application of electrical apparatus to mining processes as well as to embody some practical suggestions and statements from those who have had personal experience in the operation of such apparatus.

Following the natural order of operations, let us consider drilling and cutting machinery in the first place. Fig. 1 of the engravings (See page 277.) shows the drill manufactured by the Diamond Prospecting Company of Chicago. This is designated by them as a Type "R" machine, nominal capacity 300 feet, and equipped with a motor of 3-horse power, rated capacity. The total weight of the machine, set up and running, is 1000 pounds, and the heaviest piece, when taken apart for shipment, weighs about 170 pounds. The machine is mounted on trucks fitting the gauge of the mine-track for easy handling, and can be taken apart in 15 minutes, and put up in a half-hour without difficulty.

The drill swivels so that bores can be put in at an angle, and can be operated in a space giving five feet in the line of the drill-rods.

The general arrangement of electrical and mechanical parts is sufficiently evident from the illustration, though the pump is hidden by the pedestal on the right. This is operated by the horizontal shaft driven by the bevel-gearing shown, and supplies a constant stream of water to the diamonds through hose connected with the top of the drill-tube. In a recent test on a granite boulder, hole 1½ inches in diameter, with slow speed, this drill cut 22 inches in 40 minutes. When set up in the mine and working on hard, compact limestone, it cut the rock at the rate of one inch per minute, not including stoppages for changing the rods.

For general prospecting purposes, this drill seems to meet satisfactorily the requirements of its special line of work.

The general principle of construction of most electro-dynamo machinery provides us with a rotary motion, which it is necessary to transform to a reciprocating in order to obtain drills of the Rand or Ingersoll type. Any such transformation, however, entails a considerable loss of power, and we are happily relieved of this necessity by recent inventions which are based on the general character of the solenoid.

Fig. 2 shows such a drill constructed under the patents of H. N. Marvin of Syracuse. Mr. C. J. Van Depoele of Lynn, Mass., was one of the first to appreciate the demand for this class of apparatus, as well as the possibilities of the principle involved, and a large factory has been built by the Thomson-Houston Co. especially devoted to drilling and pumping machinery of the reciprocating type.

A description of the general features of these drills, by Mr. Van Depoele, will be published later on in this series.

Many machines have been placed upon the market in recent years for making the undercut in soft-coal mining. Several of them have met with a certain degree of success in clean

and easily worked veins, steam or compressed air (generally the latter) being the operating force. Perhaps the most successful of these machines has been that manufactured by the Jeffreys Mining Machine Co., of Columbus, Ohio.

A machine embodying the boring principle is shown in fig. 3. A Thomson-Houston motor of a special type is used in this machine, current being supplied from the main-entry wires (which may also be used for lighting, haulage and pumping) by flexible wire-covered cables. The series of cutters (nine in number, each four inches wide) is so arranged as to cut close to the mill beside which the machine is placed, and within one-eighth of an inch of the level of the floor.

Although the weight of the apparatus complete is less than 1400 pounds, no clamping is needed, as the drills will "pull themselves into the coal," with only the friction of the machine behind them as it rests on the floor. The device for clearing the drills of coal dust is as simple as it is effective. It consists of a series of hinged scrapers hung from the under side of reciprocating bars, one of which is placed between every pair of drills, and which also operates an ingenious device for cutting out the triangular space left by the drills at top and bottom of the cut. The present type of machine makes a cut three feet wide, five feet deep and four inches thick in two minutes and a half, including withdrawal of the drills. With these figures in mind, the claim of 180 tons' capacity per day for these machines does not seem excessive. As the extreme height of the apparatus is only 23½ inches, it can be used in a vein of any thickness, and two small drums are so placed in the rear of each machine as to enable it to draw itself on to a truck which accompanies each machine, ready for moving into another chamber.

Mines and Railroad Grants.

One of the most important subjects of immediate interest to the mining community is that connected with the title to mining claims on railroad grants. It is perfectly plain that the Government never intended that the railroad companies should have any mining ground whatever within their grants, but they have manipulated matters so well that thousands of acres of mineral land have come into their possession, and what is worse, they are after more. The miners are put on the defensive and are having a hard fight against the powerful corporation influences.

The evils of the system are plainly recognized and have been referred to time and again in the PRESS. Montana has been the greatest sufferer of late and has made the hardest and most united fight in the contest; but the trouble has been felt in all the Western States and Territories where land grants have been made to railroads.

The Trans-Mississippi Congress, now in session at Omaha, has been considering various questions of importance to the people of the West, and has formulated resolutions calling the attention of the National Congress to certain points. The resolutions adopted with regard to mining and the railroads are as follows:

WHEREAS, The interest of mining creates and adds to the wealth of this country nearly \$100,000,000 annually of gold and silver alone, a product the scarcity of which means the depreciation of the values of the farms, the homes and all the real property of the country, as well as the wheat, the cotton and the corn produced by our toiling millions, and the abundance of which means increased comfort and prosperity to the great mass of our people; and

WHEREAS, There are millions of acres of the best gold and silver bearing mineral lands of the West on which there are thousands of mining properties, both patented and unpatented, within the limits of the grants to the Pacific railroads, and which are in imminent danger of becoming the property of these railroad companies; now, therefore be it

Resolved, That this body earnestly ask of Congress such legislation as will protect and foster our mining interests and forever prevent our mines and mineral lands bearing gold, silver, copper or lead from becoming the property of these corporations under their grants; and that this body or delegation in this convention from the Territories of Arizona, Utah, New Mexico and the States of California, Nevada, Colorado, Wyoming, Oregon, Idaho, South Dakota and Montana, which have a common interest in this subject, ask Congress to authorize the President to select a committee of seven members, who shall form a committee for the purpose of securing such united and efficient action as will save these mines and mineral lands to the people.

Ship-Building Plants.

San Diego is discussing a proposition to establish a steel ship-building yard at that port, and a \$600,000 subsidy is asked for to remove the present entire plant from Newcastle, Pa., to San Diego bay. A general committee referred the matter to a sub committee, who formulated and submitted, from the citizens, the following proposition:

We are satisfied that \$600,000 subsidy can be raised on the following conditions:

That the principal capitalists interested will visit this city and give satisfactory assurances of their financial ability to, and that they will, carry out the full proposition.

That the citizens will then undertake to raise the subsidy. Within 30 days after the completion of the subsidy, work shall begin and be carried on until the present entire plant and works at Newcastle, Pa., shall be removed to San Diego bay and erected and in operation, employing 250 hands, within seven months from date of contract or completion of subsidy. Said works when here and erected shall be of the appraised value of \$800,000, one appraiser each to be appointed by the parties and they to select a third; then 25 per cent shall be paid.

That within one year thereafter they will erect and put in operation on the bay a pipe and tube factory employing 250 men, a steel plant employing at least 350 men, a tin plate factory employing 300 men. And when each of these industries are established and the men employed, then 10 per cent of the subsidy shall be paid on each.

That within six months thereafter a rolling-mill and steel-rail works shall be established and 1000 men employed. Then 15 per cent of the subsidy shall be paid. And whenever ship-yards are established and from and steel ships being built and 8000 men are employed in the whole system of works, then the remaining 30 per cent shall be paid, provided it be done within one year after the last payment.

We also believe that a site or sites for the location of the plants can be obtained accessible to rail and ship.

This proposition, Mr. C. L. Habbie has telegraphed to his principals East.

This is a pretty large subsidy for San Diego to give to a single institution, but it is on the "installment plan," according to the proposition.

We already have, in San Francisco, a fine ship-building plant, established without any subsidy, but solely by the enterprise of the proprietors of the Union Iron Works. A number of prominent gentlemen visited these works a few days since and on the ways saw the hulls of four iron and steel vessels with the coast defense vessel, Monterey, afloat near by. Among those in course of construction is the big battle ship Oregon, and cruiser No. 6. The largest steam tug in the world is also being built at this yard. When the visitors saw five steel vessels being built at once, side by side; saw the Arago, the first vessel built by the Union Iron Works, undergoing repairs in the magnificent hydraulic dry dock, and went through the great shops and foundries, where ponderous machinery and huge boilers, weighing 80 tons, were being rapidly constructed, they were impressed with the fact that the Pacific Coast is already equal to any demand in the way of naval construction that may be made upon it.

It is to be hoped that San Diego will also establish a big ship yard, for there is plenty of room for more enterprises of this character on the shores of the Pacific.

Price of Quicksilver.

About three months ago mention was made in the commercial column of this paper that quotations for New Almaden quicksilver, had been withdrawn. The withdrawal of quotations was, at the time, stated to be due to a lessened output of quicksilver, a good demand and the certainty that better prices would soon obtain. At that time the range of prices was given at \$40 to \$41 a flask, hut to-day the market is quotable firm at \$47 to \$47.50 per flask for jobbing lots and \$50 a flask for carload lots, with the New Almaden Co. in the market as sellers. The advance is due to higher prices abroad brought about by a lessened output and a freer demand.

About all the quicksilver produced by the United States comes from California; Oregon, however, contributing a few flasks. There are no other producing mines in this country. There are not as many mines being worked here now as ten years ago, and the production of those that continue has not been as large as formerly. The richer bodies of ore in our productive mines have been worked out and the ore now being beneficiated has a low percentage of metal. The

demand for quicksilver does not decrease since mining operations are constantly widening, though the loss of quicksilver in milling operations is much less than formerly. These are some of the reasons for the recent advance in the price of this most useful substance.

ELECTRIC ROAD.—If no unforeseen delay intervene, the running of cars on the line of the San Francisco & San Mateo Railroad will begin on January 1st next. Track-laying over the entire route from the foot of Market street to Biden, in San Mateo county, is finished, and all switches and crossings are in place, except that

WIRES ON HOUSETOPS.—Judge Hebbard has rendered an important decision in the suit of David Henzel vs. Chief Sennell of the Fire Department. The action was to enjoin the department from removing electric wires from various buildings on which they had been erected by the plaintiff in violation of order 2301 of the Board of Supervisors. This order prohibits the suspension of electric wires over or upon the roofs and tops of buildings, and under it, it is the duty of the Chief Engineer of the Fire Department to remove all wires maintained contrary to these provisions. Henzel based his suit on a claim that the order was illegal and

BUTTER'S GRINDING AND AMALGAMATING PAN.

at Ocean View, which will be completed next week. The overhead wire, which will extend over the length of each track, is now being placed in position. The company has two sizes of cars, one style being 24 feet in length over all and the other 30 feet. The middle portion of each style is the same, the additional length being in the outside seat extensions. In appearance the cars resemble the new double-end cars on the California street cable line. At present the company has 30 cars, 15 of each size. Next spring as many more cars will be ordered.

DOUGHERTY'S MILL, located about five miles above Boulder Creek, on a branch of the South Pacific Coast railroad, was burned to the ground Saturday night. The loss of the mill, machinery and manufactured lumber is estimated at \$50,000.

FIVE new locomotives have been received by the Southern Pacific Company from the East. They are very heavy and are of the compound type. They weigh from 65 to 70 tons each.

invalid, because constituting an unreasonable exercise of the police power vested in the Board of Supervisors. Judge Hebbard held, however, that this point was not well taken. He therefore denied the injunction asked for, and gave judgment for the defendant, with costs.

KEYES PROPERTY SOLD.—A dispatch from Virginia, Nev., dated October 24th, says: The Keyes mine, in Seven-Mile canyon, was sold at sheriff's sale to day to satisfy a judgment of \$3055 obtained in the District Court for wages due miners and material furnished. The property was bid in by O. Loukey, the principal creditor, for the amount of the judgment. Several adjoining mining locations were included in the sale, among them the Mountain Brow, Silver Eagle, Virginia, Standard, Rosebud, Bonker Hill, Golden Eagle and Sugar Loaf, all situated in Six and Seven Mile canyons, this county, and claimed by Patrick J. Keyes, the locator.

THE Aldermen of Butte, Montana, have passed an ordinance prohibiting heap-roasting of ore in that city.

Double-Discharge Leffel Water Wheel.

(Continued from page 277)

Of its many meritorious features, the principal one is its double discharge, the water being divided equally at the outer and passing parallel with the shaft in opposite directions, discharging downward on each side of the wheel through curved pipes, without end thrust. The casing is made as narrow through the central portion as possible, in order to obtain the shortest distance between the journals, bringing them as near to the wheel as the discharge space will permit, securing a solid and substantial arrangement in the most condensed form.

The wheel is suitable for all purposes, especially where power is transmitted from a main horizontal line of shafting, which can be driven direct by one or more pulleys on the horizontal water-wheel shaft.

During the past year a number of applications of these wheels have been made to electric lighting, electric power, and other uses, directly from pulleys on the water-wheel shaft, to the pulleys on the dynamo, the saw arbor, or pumping machinery. In some instances pulleys are used on each side of the wheel, making a double pulley arrangement, and in some cases two or more pulleys have been applied on the same side.

The James Leffel & Co. will be pleased to furnish plans and estimates of the cost of entire water-power plants for all purposes, upon application to Springfield, Ohio, or 110 Liberty street, New York.

Butters' Patent Grinding and Amalgamating Pan.

This machine stands on an ordinary wooden bed-plate *A*, to which are bolted the cast-iron columns *B* that support the top framing, one column being required for each grinding roller employed, the most suitable arrangement being from three to five rollers, according to size of pan. The cast-iron beams *C*, for carrying roller spludges *D* and the vertical driving shaft *E*, are bolted to a flange on the columns *B*, shown at *x*. The compressing springs *F*, for giving the required pressure on the grinding rollers, are held in position by a crosshead and columns, as shown at *y*, and are so arranged as to be adjustable by means of the hand-wheel and screw *G*, a jam nut being provided to hold the screw in position when the desired pressure has been obtained. On the spludges *D* the grinding rollers *H* are placed, and revolve upon them, the spludges being stationary, held by a feather in the cast-iron beam *C*. To minimize wear, and to prevent dust getting into the bearing, a specially designed bush and footstep *I* are provided. The grinding face of the rollers is fitted with a specially hard facing piece *K*, so arranged as to be easily and expeditiously replaced in the event of wear through time. The cast-iron false bottom *L* is made specially hard, and is simply laid in position in the recess provided for it in the bottom of the pan on a bed of cement; the space *M* between the outside periphery of the false bottom and the side of pan acts as a quicksilver well. The pan *N* is keyed on to the vertical driving shaft and revolves with it, and thus driving by friction the grinding rollers at a high speed relative to the difference in the diameters of the pan and rollers.

The machine is also fitted with a tailings pan not shown, so arranged that the reduced materials flow through gratings in the side of the grinding pan *N* into it.

The special advantages claimed are speed of reduction and amalgamation, a five-foot pan with three rollers being capable of reducing half a ton of hard two-inch quartz per hour; no special foundation is required; it is easily driven and readily adapts itself to an arrangement of automatic feeding either by elevator or other feeders.

THE eleven lumber companies operating in the vicinity of Truckee cut 42,000,000 feet this summer. This is within 2,000,000 feet of the best cut on record. Trade has been quiet. The box trade, on the contrary, has been good.

A MINERS' HOSPITAL is to be established at Shasta and a building has been rented. It is proposed to run the business on the plan of the Railroad Hospital at Sacramento, by levying assessments among miners of the county.

EDWARDS' WORKS ON THE STEAM ENGINE.

The American Marine Engineer. Theoretical and Practical. With Examples of the Latest and Most Approved Marine Practice. For the Use of Marine Engineers and Students. By Emory Edwards, Marine Engineer. Illustrated by 55 engravings. 12mo. 435 pages. Price, \$2.50

Edwards' 600 Examination Questions and Answers. For Engineers and Firemen (Stationary and Marine) who desire to obtain a U. S. Government License. By Emory Edwards. Full bound in pocket book form, leather. 130 pages. Price.....\$1.50

The American Steam Engineer. Theoretical and Practical; with Examples of the Latest and Most Approved American Practice in the Design and Construction of Steam Engines and Boilers of Every Description. For the use of Engineers, Machinists, Boiler Makers, and Students. By Emory Edwards, M. E. Illustrated by 77 engravings. 12mo, 419 pages.....\$2.50

PROPOSALS FOR TUNNELS

OFFICE OF THE CHIEF ENGINEER OF THE Arrowhead Reservoir Company, San Bernardino, California, October 10, 1931.

SEALED PROPOSALS

Will be received by the undersigned until noon of **TUESDAY, the 15th of December, 1931**, for the construction of three tunnels—one of about 2000 feet in length, the second about 4000 feet in length, and the third about 5000 feet in length, through rock, in accordance with plans and specifications on file in this office. Proposals must be accompanied by a certified check in the sum of \$2000, to be returned to the unsuccessful bidders. The Company reserves the right to reject any or all proposals.
A. H. KOEIG,
Chief Engineer The Arrowhead Reservoir Co.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Oct. 29, 1891.

General trade continues fairly active, with all branches participating. The money market is easy, with more funds offering for investment. Papers in the agricultural counties report more money offering than known for years past, causing a lower range of interest. Tax-collectors in the interior counties say that very few persons take advantage of the half-payment of taxes, for, as a rule, they have paid the total amount in one payment.

MEXICAN DOLLARS—The market is weak at around 77 cts.

QUICKSILVER—Receipts the past week aggregate 177 flasks, and the exports by sea 40 flasks of domestic and 100 flasks in transit to Mexican ports. The market is very strong at another advance. The movement is due to higher prices abroad and stronger holding here. In the local market, small orders are filled at \$47 to \$47.50, while for carload parcels \$50 is asked.

SILVER—Prices at home and also abroad continue to drop, and this, too, in the face of the statistical position of the metal favoring higher prices. The weak and easing market is accepted as proof positive of a strong speculative influence. The mines in Nevada and Arizona are turning out less than they did in 1890. The results of the State elections to be held in next week will probably have much to do with values in the immediate future. The fight in Ohio is being waged on the tariff and silver issues. The electors favoring silver are said to be working among legislators who favor the return of Senator Sherman to the U. S. Senate.

BORAX—No receipts are reported the past week, but a shipment of 274 cts was made by steamer to New York. The market is essentially unchanged.

LIME—Receipts the past week aggregate 3467 bbls. Free shipments are being made to the Hawaiian Islands. The home demand is fair. The low prices ruling for cement are against lime.

ANTIMONY—The market is fairly steady at the recent advance.

COPPER—The market is in a demoralized condition, consequent upon still lower prices abroad. English cables to *Iron Age* report as follows: "Consumers are still holding off, being influenced by the fact that large quantities of three months' futures bought last July are being liquidated. More or less pressure has also been brought to bear upon the market by certain dealers who appear to be bent upon keeping prices down until the sale of the Society des Metaux copper holdings, which is on the boards for Dec. 2d. Transactions in furnace material have been on a large scale, including 2500 tons Anaconda Matte for delivery up to April, 1892, terms not made public. European spot stocks are reported to have increased 1283 tons last month and the visible supply 597 tons. Chili charters for the fortnight were about 1000 tons."

TIN—Receipts the past week aggregate 500 boxes overland. The market is dull with concessions reported obtainable for both pig and plate. English advices report continued shipments of plate for this city. At New York pig has receded, closing heavy. Mail advices report the New York market as follows: London has furnished more or less variable reports from day to day, the net result of which would appear to be in buyers' favor, and the primary sources of supply have furnished a "bear" card in the shape of heavy shipments from the Straits, the latter amounting to no less than 1525 tons for the first half of the month. Pending developments upon the arrival of overland shipments, speculation is practically at a standstill, and large consumers, who evidently begin to gain some idea of the manipulation that is being indulged in, are buying with more than ordinary caution.

LEAD—The market, while weaker at the East, shows but little if any change with us. The Eastern market appears to be in a muddle condition so far as requirements are concerned. As yet, they do not appear to have been up to expectation.

IRON—The market is quoted higher for Oregon and Puget Sound, which is used for special purposes. Foreign iron is unchanged. The consumption continues free. *Iron Age*, Oct. 22d, reports that the demand for steel rails is increasing, which naturally inspires the belief that pig iron will soon begin to do better.

COAL—Receipts the past week aggregate as follows: Newcastle, N. S. W., 6786 tons; Greenock, 2250; Departure Bay, 5900; Tacoma, 4744; Nanaimo, 6843; Grimsby, 750; Glasgow, 2130; total, 26,403 tons. For spot and cargoes on passage the market continues weak, but for shipment, higher freights are against buyers. It is reported that in view of lessened shipments of foreign after next month, coast mines will have their output regulated so as to bring about better prices in the spring months.

Eastern Metal Markets.

By Telegraph.

New York, October 29.—The following are the closing prices the past week:

	Silver in London.	New York.	Copper.	Tin.
Thursday	44 9 15	96 1/2	11 90	4 25
Friday	44 1 15	95 1/2	11 60	4 25
Saturday	44 1 15	95 1/2	11 60	4 25
Sunday	44 1 15	95 1/2	11 60	4 25
Monday	44 1 15	95 1/2	11 60	4 25
Tuesday	44 1 15	95 1/2	11 60	4 25
Wednesday	44 1 15	95 1/2	11 60	4 25

Quicksilver is higher and very strong. Tin is weak and lower, as is copper. Lead is steadier at the decline. Pig iron is going into treacherous consumption.

A RICH TAKE—The Buzzard mine, owned by G. T. Salisbury and S. W. Handerson, situated near Inskip, this county, is making its owners rich. It gets better as they get into the ledge. Mr. Salisbury was down to-day and says that a few days ago they took \$700 from two feet of decomposed quartz and got it by means of mortars and pans. The quartz is thoroughly decomposed and is very rich.—Oroville *Mercury*.

FRUE ORE CONCENTRATOR

OVER 3000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

Manufactured under Patents of April 27, 1880;

September 18, 1883; July 24, 1888;

and March 31, 1891.

Price of Plain Belt Frue Vanner, \$575, f. o. b.

Price of Improved Belt Frue Vanner, \$825, f. o. b.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs"; for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - \$650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,

39 to 51 Fremont Street, San Francisco, Cal.

Original Empire Mill and Mining Company,
Principal Office, 461 California St., cor. Sansone, S. F.
Location of Works, Grass Valley, Nevada Co., Cal.
GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices.

Signed] Sup't North Star and Original Empire Mining Co.
N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 1300 IN USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

THE PELTON WATER WHEEL CO.

121-123 MAIN STREET, SAN FRANCISCO, CAL., U. S. A.

PELTON WATER MOTORS. Varying from the fraction of 1 up to 15 and 20-horse power, unequalled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. Address as above.

THE GATES ORE AND ROCK BREAKER.

UNLIMITED IN CAPACITY. UNEQUALLED IN EFFICIENCY. UPWARD OF 3,000 NOW IN USE. Will do more than twice the work of any other with the same cost in wear. Gives a fineness of product that increases the capacity of any mill from 25 to 40 per cent without any additional expense. THE BEST AND ONLY CRUSHER ADAPTED TO MACADAM ROAD WORK. Send for Circular.

It having come to the notice of the undersigned that their patent rights are being infringed upon, intending purchasers are hereby warned that all such infringements will be duly prosecuted. (Signed) THE PELTON WATER WHEEL CO.

THE PELTON WATER WHEEL CO., 121-123 Main Street, San Francisco, General Western Agents.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Concentrating Belt manufactured in San Francisco; we can therefore fill all orders on short notice. The length and width of these belts are the same as is used on the Frue or Triumph Concentrating Machines, but can be made of any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen. First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth.

Electric Mining Machinery.

In continuing this subject from last week's PRESS, other ones are presented from Mr. Spaulding's paper before the American Institute of Mining Engineers. In the opinion of many practical coal miners, the principle of the rotary drill has many points of superiority in undercutting machines, and the accompanying cut shows the result of considerable experimenting and outlay in this direction by the Hercules Mining Co. of Pittsburg, Pa. A series of drills is operated by a Tesla alternating motor, the power being transmitted by a belt, as shown, and the current being supplied to the motor by three armored cables. When in operation the cutter is clamped on the rails parallel with the face of the coal, being shifted along this track after each cut, ready for another. Compressible springs are wound upon each drill-rod, and serve as conveyors for the coal dust cut out by the drills.

After boring or drilling in ore or coal, it must be hauled out of the mine, or from one point to another under the surface. To W. M. Schlesinger is due the honor of constructing the first electric locomotive strictly for mining purposes in the United States. This was of 35-horse power rated capacity and was put in by the Lykens Valley Coal Co., Pa. A series of iron rails were joined together to form a conductor for the current, which, after passing through the motor, completed its circuit to the generator by the track rails, which were connected also by copper wires.

A locomotive of 40-horse power capacity has been in operation at the Hillside Coal Co.'s Erie Colliery near Scranton, Pa., a description of which shows fairly the conditions to be ful-

filled by this class of apparatus in the anthracite coal regions of Eastern Pennsylvania.

The locomotive shown in the illustration embraces many new features in motor construction and general design, and under practical test has shown that it is particularly adapted to the work required of it. It is built for a three-foot gauge and is of the following dimensions: Length over all, nine feet seven inches; width, five feet three inches; and height, five feet six inches. This last dimension can be considerably reduced by placing the rheostat at one end instead of on top, as has been done in the present instance. The weight of the locomotive is 10,500 pounds, to which 1800 pounds has been added to increase traction. The motor employed is of the type "G" railway motor of 40-horse power.

A novel trolley-arm is used, which requires no attention when the motor is reversed. Its construction is such that a wide variation in the position of the conductor is permissible, a range of three feet six inches being easily covered, while the meeting of an

ELECTRIC MINE LOCOMOTIVE FOR UNDERGROUND USE.

obstruction simply causes the trolley-arm to fall by the side of the car without resulting in any damage. From the trolley-wheel, the current passes along the arm to the fuse-boxes,

then through the rheostat and motor to the rail.

The locomotive is run by one man, who is assisted by a boy in making up trains and turning the switches. It displaces seven mules and three drivers.

FROM FORTY-MILE CREEK.—This creek is 1600 miles up the Yukon river, in Alaska, and a number of miners have returned from there recently. Twenty-five men came out this trip and 125 remain. In the diggings it is from 4 to 30 feet to bedrock. The season lasts but six months, and all the miners worked steadily in order to make the most of it. As a rule, they did very well. The party here will go back in the spring. Meantime, they say they are going to get thawed out at some of the California hot springs. There is a band of about 200 Indians of the Stick tribe in the Forty-Mile district, and some of the miners have taken wives from the band. They are snowed up a good deal of the time, but those that are ambitious pile wood on the snow, melt it and the frozen ground down, and then sink holes and prospect. In the time they have at their disposal in winter, they can sink enough holes to find good ground somewhere. The largest nugget taken out this year was one of 14 ounces. The biggest single cleanup from sluice boxes made by ten men was \$1460. The dust averages about \$17 to the ounce.

ONYX.—From general reports, onyx is getting to be almost too common for anything. It is being mined in Colorado so cheaply that it could be used for building purposes. Great quarries of it have been opened up in Missouri and Arkansas, while Arizona will soon be supplying the Western market. It is doubtful if any mineral in many years has undergone such radical changes in value in such a short time.

ELECTRIC COAL CUTTER OF THE HERCULES MINING COMPANY.

A Salt Mine.

A correspondent of the *Bulletin* writing from La Paz, Lower Cal., says:

The wheels of progress have not revolved as rapidly in this section of Mexico as in other portions of the civilized world. The main reason for this lagging propensity is to be found in the absence of such lubricating influences as energy and capital, of which, up to the present time, there has been "a long-felt want." Still, we are not hopelessly behind, as evidences of late go to prove.

The pearl fisheries, for instance—one of our main industries—through the recent infusion of fresh capital and some of your "home-made" energy, are yielding a much greater product, although, like the dutiful subjects of Persia's Shah, they are hounded with a heavy civil list. But what I desire to speak of at this time, more especially, is the sale, just effected, of what is known to some of your readers as Las Salinas, one of Nature's most remarkable laboratories, found nestling among the hills on the island of Carmen, near the western shore of the Gulf of Cortez, midway between this port and Gnuaymas. The purchasers are understood to be the Atchison, Topeka and Santa Fe Railroad Co., whose network of railways, extending from Gnuaymas, near by, to the main centers of population throughout the United States, will enable them, if the so-called McKinley tariff should give place to some one of its rivals to drop salt like the "gentle dews of heaven" or the manna of ancient days over the whole of Uncle Sam's dominions. They must have thought the political signs of the times portentous, and that it would be an act of wisdom to take time by the forelock, as it were, and as good Republicans asseuage the bitterness of defeat, should it come, by the addition, from Nature's storehouse, of a few millions of lucre, and with an eye single, at least partially, to business to make the island of Carmen a sort of southwestern terminus.

The transfer is certainly important, in view of future possibilities, and nothing but the barrier of duties can prevent its resulting in one of the most remarkable operations of modern times.

The amount of salt on the island cannot be even approximately calculated until it becomes known just where the bottom is. It is said that efforts have been made to sound the saline mass by shafts sunk near the middle. These, after passing through pure chloride of sodium, in uniform crystal, lying in regular strata, ended in salt. Each stratum is understood to represent nature's annual product, with the lines of division remarkably well defined. At nearly all times there is water on the surface, varying in depth, as the process of disintegration takes place, from one inch to two feet, and even three feet at rare intervals.

Whence comes all this water, which is heavily charged with saline matter, is so far an unsolved problem, although it is naturally supposed to come from the sea, distant at the nearest point nearly three-quarters of a mile. The land on all sides is hard, dry and mountainous, except to the southward, where it is perhaps 20 feet above the level of the gulf. On the side of the lowest land and nearest approach by water there is a well-protected bay, in which good anchorage has been found for vessels of large tonnage. Those seeking cargo are reached by a wharf and tramway leading directly from the "salinas," or lake, as it is sometimes called, because of the water usually seen on the surface. The cost of loading such vessels after the new owners have completed their arrangements will not exceed 25 cents per ton, while the expense of conveying the salt thence to the company's cars at the port of Gnuaymas may be brought under \$1 a ton. The tide, which is of excellent quality and believed to be fully equal to the Liverpool variety, will then be on their own ground and can be transferred to United States soil in almost unlimited quantities at prices likely to defy competition, and, as the supply seems inexhaustible, what may the new owners not be able to do when the barriers are down and they can pass the border unchallenged? How all your small salt producers will be forced to the wall, or into profanity, when they find themselves under their iron hoof of one of the biggest of modern trusts. On the other hand, should Uncle Sam stand by his portcullis, they may have to content themselves with small profits, since the duty on foreign salt is now with them a grave impediment.

The whole western coast of Mexico, for a great many years, has obtained its supplies of salt at Carmen Island, amounting to thousands of tons yearly. Still there has been no depletion, as Nature keeps constant watch and fills all spaces to the brim with just as good an article, while every hour of sun adds to the deposit. All the water that appears so mysteriously on the surface vaporizes and the residuum remains as solid crystals. A fresh supply of water then appears, and under the hand of Nature, passes through a similar process.

The effect of all this is apparent, but the cause or source seems to be one of those things, as Dunderberg would say, that "no fellow can find out."

This so-called lake is nearly circular in form, with a circumference, or more properly, periphery, measuring over four miles, indicating, as will be seen, an immense deposit and making the price now paid—understood to be \$300,000 in gold and bonds at market value—appear almost nominal.

Women in Mining.

The exigencies of frontier life have drawn many women before now into what have always been considered peculiarly masculine pursuits, and not often the new existence has developed talents of which no man need feel ashamed. There was many such cases in California in early days—cases where the man had tried and failed and the woman had picked up the unfinished task and succeeded. In these later days, however, it is somewhat singular to see a woman going out in the wilderness, where many men would fear to venture, and roughing it with the hardest of them. The following tale is taken from the *Tacoma Call*:

To look at her, one would not suppose that Mrs. Emily Knight of Tacoma was the kind of woman who would face and have experienced all the hardships of a miner's life, going far beyond the pale of civilization, away from all refining influences, among mountain fastnesses and previously untraveled regions, where many men would fear to go and it would appear impossible for a woman to venture, and push forward with indomitable courage, until she at last reached the goal and the El Dorado of her hopes; yet such is what this lady has accomplished.

Mrs. Knight has a refined appearance and is well preserved, not having passed the zenith of life. When enjoying the benefits of society and civilization she dresses modestly, yet becomingly; but what is particularly noticeable about her is the resolute lines of her mouth and chin and the determination in the glance of her eyes.

The lady arrived last evening from North Yakima, where the entire population of the town has gone wild over the energy and pluck that she has displayed. North Yakima is the point from which Mrs. Knight starts to her mining properties in the Gold Hill district, about ten miles east of Mount Tacoma, and 62 miles from North Yakima.

For over a year Mrs. Knight has been aware of the existence of extensive mineral deposits in the Gold Hill district, but it was not until recently that she finally decided to bond the 17 claims in the district, comparatively close to each other, for \$50,000. She has now returned from her properties and decided to take up the bond and make the necessary improvements for taking out ore. Even during her absence Mrs. Knight declares she cannot afford to lose any time in the work of development, and has a cook and three shifts of men engaged steadily in improving the Blue Bell, her most promising prospect. Upon her return, which will be in a few days, she will take with her enough provisions for the winter and work her claims without interruption until next spring.

At a recent meeting of the County Commissioners, Mrs. Knight appeared before the Board and explained the necessity and advantages of the construction of a wagon road from that city to the Gold Hill district. The Commissioners then decided to build a road to the district by way of the Naches valley. A telephone is also to be built to the mines mentioned, Mrs. Knight furnishing the poles.

The different prospects owned by Mrs. Knight on the Gold Hill district are situated in a broad deep gulch, and there is a separate vein to nearly every claim, and, in some cases, these veins can be traced 4000 feet. The ore carries both gold and silver, and runs from \$170 to \$281 to the ton. The veins lie south-east and northwest, in a solid formation, and are fissure veins. The Blue Bell, Emma and Union seem to be the most promising prospects. The Blue Bell is the only one being developed at present.

When seen in E. F. Russell & Co.'s office to-day and questioned about her experiences and prospects, Mrs. Knight said:

"Why do I follow this kind of life? Because I like it. There is a certain amount of fascination in mining and dealing in mines that particularly appeals to me. Think, one engaged in such a pursuit may be rich to-morrow, although comparatively poor to-day! But experience and hardship is necessary in most cases to make such a vocation a success. This is not my first venture in mining. I am familiar with the mineral deposits of Nova Scotia as well as those of both New and Old Mexico. I have visited other mineral localities, and been more or less successful."

Mrs. Knight was born in Lancashire, England, but has lived in this country some years, principally during her residence in the East, at Boston, where her daughter now resides. She has traveled all over the United States; was in the San Diego real estate boom, and made considerable money before the crash came, then shrewdly refused to invest there. She has resided until this last mining venture, for two years in Seattle, making more money in real estate and business enterprises. She seems to be in perfect health.

When Mrs. Knight starts out on her next trip, she will wear a fine suit of buckskin clothing of the regulation hunter's style. In going through the gorges and ravines, and fording the swiftly flowing creeks, a woman's clothing would be sadly torn, whereas with a man's buckskin garments she will experience no difficulty in making her way through the wild region through which she will pass.

Mrs. Knight shares the honor with Mrs. James Hensley, known by the miners of Castle, Montana, as "Little Dot," of being the only female miners in the world. "Little Dot"

is about 30 years old, and until her marriage with James Hensley, a year ago, had been a miner or rather a minereess, for the last ten years, doing all the work herself. She was shut off from civilization in all that time, wearing men's clothes and working in her mines with pick and shovel, not seeing the face of a woman for many years and very seldom meeting even a man. She accumulated property rapidly and when she took to herself a husband, this plucky little woman was worth at least \$75,000. In Montana "Little Dot" is as well known and respected as Mrs. Knight of Tacoma and Gold Hill will be before long.

A New Slime-Saver.

The Shasta County *Democrat* says:

Soon after Messrs. Yount & Reed, assayers, set up their assaying outfit in Redding, and after becoming familiar with the character of the gold-bearing quartz of the county, they discovered that the bulk of the value of the ores was carried off in the slimes. Judge Reed, who has had years of experience in mining in California, put his inventive mind to work to devise an apparatus for saving those slimes, at the same time freeing the slimes of the valueless gangue. He and Mr. Yount made a model, with which they experimented with various ores at their assay office, and found that the idea carried out in the model worked satisfactorily. About this time, W. D. Biegle and P. J. Bughee started up development work on the Sky Blue mine on the east side of the river opposite Middle creek. Messrs. Yount & Reed suggested to Mr. Biegle that he try their device on the Sky Blue ore, as it would cost only a nominal sum to put it up. Mr. Biegle did so, and having carried out their idea, has practically demonstrated that the slimer is a most gratifying success. In fact, it is a simple apparatus that will revolutionize mining in this county and State. With the slimer—that is the proper name for it—ten tons are concentrated into one, and the most the tailings will assay is one dollar a ton. The machine concentrates and saves practically everything of value there is in the ore. Fortunately for the machine, the ore in the Sky Blue is exceedingly refractory, as it carries copper glance, arsenical iron and copper sulphurets, free gold that will not amalgamate and every fine particle of quicksilver that has flourished. The machine even saves the copper glance which crumbles into an impalpable powder. Messrs. Yount & Reed inform us (and we can say to the miners of Shasta county that they are reliable in whatever statement they make on such matters) that their slimer, in this practical test, has proven a wonderful success and greatly exceeded their most sanguine expectations.

In company with Barney Conroy, W. H. Fowler, the mining expert, and Phil Bughee, we went out to the Sky Blue to see this new concentrating device work. Mr. Biegle was there, and took delight in showing and explaining how the thing worked. To our astonishment it is a most simple device, and does absolutely save slimes, for there they were running from the battery, over the plates, down a sluice-box and into the slimer, where they settled. To speak candidly, we are not prepared to say, at this time, that this slimer actually does the work claimed for it. That is to say, whether this one single slimer concentrates the values in the ore to the per cent claimed in this test. But it does save slimes as well as sulphurets and minerals which go off in suspension. There is one thing we are perfectly satisfied with, and that is this: The idea is unquestionably a good one, and applies itself directly to the natural peculiarities of the mass which flows from the battery. If one slimer does good work, but fails to save all that is necessary, one or more will; and in case, for instance, any heavy mineral substance which will not float nor amalgamate, but goes off with the gangue, that could be saved by placing the well-known vanner at the end of the slimer. Finally, after seeing this device work and seeing the proof before our eyes that it does save slimes, and rapidly, too, the thought forcibly strikes us that it is only a question of the number of slimers in any given plant to successfully and profitably work on the ground any of the gold ores in Shasta county.

COMBINATION OF MANUFACTURERS.—When the Employers' Association was formed for the protection of its members against the encroachments of unions, an article was inserted in its constitution which provided that each industry represented should be thoroughly organized, and when so organized should deal with all matters of interest to its members, and failing in any case to settle matters to its satisfaction should appeal to the general organization for assistance. Since the Employers' Association was formed several industries have been organized according to its requirement. The latest is the furniture manufacturers. It is said that 15 manufacturers are members of this branch of the association. William Kreling is President and Geo. Fuller Secretary.

CEMENT DEPOSIT NEAR GILROY.—A fine deposit of cement was discovered a few days since on the Lion & Backley ranch six miles north of Gilroy. Experts say it will equal the best Portland cement.

THERE are 60 miles of snow sheds on the Central Pacific Railroad.

Nevada County Iron.

A correspondent writes the following letter in a recent number of the *Grass Valley Tidings*: There is a general impression that San Francisco cannot manufacture iron and steel successfully; industries which if established would add wonderfully to the prosperity of the whole coast.

Nevada County Iron.

On this subject, Nevada county should be heard. In the southwest corner of this county, bordering on the plains, is a very large deposit of hematite and magnetic iron ores which will yield from 55 to 60 per cent of metallic iron. Of this iron ore, there is sufficient in sight to run a 50-ton furnace for half a century.

To show that this ore can be worked advantageously and to a profit in the city of San Francisco is the object of the writer. Capital is all that is required to develop a profitable investment.

It Will Pay.

First, it would be necessary to establish a line of communication from the deposit to San Francisco. This would consist of a railroad running seven miles through the foothills and 12 miles on the plains to the Sacramento river, from which point cheap water facilities would be had.

With such a transportation line, we will proceed to show the cost of making a ton of iron or steel in San Francisco:

Royalty on ore and loading cars.....	\$ 2.00
Freight.....	2.50
Coke, 1700 lbs. at 45c.....	7.65
Labor at furnace.....	1.80
Lime rock.....	1.00
Total.....	\$14.95

These figures are for one ton of molten iron, which would be of quality serviceable for castings, gas and water pipe and innumerable other articles of the trade.

A Big Shop.

By having a large shop so constructed that a locomotive carrying a crane ladle should traverse its center, molding space could be rented to all who desired it and the molten iron sold on the spot. This would save to individual firms the cost of expensive works, and such firms would be willing to pay from \$5 to \$6 over and above the market price of pig iron.

Furthermore, by keeping the iron in a molten state, it can be refined and used for all kinds of machine castings.

Steel.

And from the molten iron, by having the requisite Bessemer plant, steel can be produced at a cost of from \$3 to \$5 per ton, according to the quality. With rollers, the steel can be turned into any shape required.

It Means Much.

All this means that capitalists who are erecting six, eight and ten story buildings would no longer find it necessary to send their money East to purchase steel frames, and instead of San Francisco building up at one end, the new industry would build up both ends of the city by the employment of thousands of men, enriching the city by keeping the money at home.

At what other point on the Pacific Coast can the iron ore advantages I have outlined be duplicated? And in San Francisco, the market is at our door. San Francisco has obtained a start in the business of building steel ships and ironclads, but to hold its prestige and increase its business in that line something more than has been done must be undertaken and successfully carried out.

Nevada County's Offer.

Nevada county can show the capitalists by the Golden Gate how a ton of molten iron can be produced right at home for \$15.

The best quality of Bessemer steel for \$20.

Plates for ship-building for \$25.

Railroad iron and iron for building purposes for \$25.

These figures are maximum. Should the transportation line develop sufficient other traffic—and it certainly would, as the country to be traversed is very fertile—the cost of freight would be minimized. Such a line in time would pay interest on the investment from traffic other than the transportation of the iron ore.

Profits.

This molten iron, costing in San Francisco \$15 per ton, can be readily disposed of at \$28 per ton, a net profit of \$13 per ton. Estimating a product of 50 tons per day and 30 days a month, a monthly profit of \$19,500 is to be seen.

Should the company manufacture steel plates or castings, the profits would be still larger.

However, in the figures presented, is margin enough to yield six per cent on an investment of over \$3,000,000.

ONE HUNDRED ASSESSMENTS.—The *Virginia Chronicle* says: The assessment pending on Sierra Nevada stock is the one hundredth assessment levied by that company, and the number is the largest ever levied by a corporation, of which there is any record. The total sum of the assessments levied by the Sierra Nevada Co. to date is \$6,446,910, and \$102,500 has been paid in dividends, the last of which was disbursed Jan. 16, 1871. The amount of the assessments levied by the Sierra Nevada (\$6,446,910) is surpassed by only one Constock company—the Savage—whose total is \$6,770,000, but the Savage has paid \$4,460,000 in dividends, the last of which was paid June 11, 1869.

Averaged according to seasons, showing the amount in inches of each month, during forty-one years, and for each rising season, to Dec. 31, 1880; also the quantity for every month, and the annual amount of rain.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

El Dorado.

VAN.—Georgetown *Gazette*, Oct. 27: The new hoisting works on the Van mine is now in operation, and the mill is expected to start up this week. The building for the new ten-stamp mill on the Darling mine is already framed and will soon be equipped with a first-class plant.

Nevada.

THE FOUNTAIN HEAD.—*Transcript*, Oct. 28: Work has been temporarily suspended at the Fountain Head drift claim. The company have some money on hand, but not sufficient to continue operations to the desired extent. Everything at the mine is in good shape. The hoisting and pumping machinery is in readiness to be started on short notice. There is no doubt the Fountain Head will pay good dividends when it is once opened. It has the best of management in every way, and when the necessary funds for its proper development are insured—which will not be a very long time hence—it will be running again and will suffer no more interruptions.

TO START UP.—*Grass Valley Telegraph*, Nov. 3: On Monday next, work will be commenced on the Merrimac mine, situated just back of Glenbrook Park. Chas. E. Clinch and Cornelius Wilhelm have secured the mine and they will lose no time nor spare means in developing the property. This week articles of incorporation of the mine will be filed. The property will be in 100,000 shares, of which 40,000 will be set aside for a working capital. Mr. Chas. Stocks will have charge of the Merrimac in the capacity of superintendent, and is now making arrangements for the purchase of hoisting and pumping machinery. Years ago the Merrimac was worked by Geo. D. Roberts, Geo. Hearst and other well-known mining men, and at the time of active operation was very rich. The ore yielded about \$16 per ton on an average. Capt. Henry Scadden, who was the latest superintendent of the mine, and who knows all about the depths, is so confident about the mine that he is very enthusiastic over what is possible for its future.

Shasta.

MULETOWN MOUNTAIN MINES.—*Courier*, Oct. 31: John Doebelin of Muletown has discovered and is working a ledge, the Midoight, on Muletown mountain, in Centerville mining district, that gives flattering promise of developing into a big thio, the first assay going up to \$306 per ton in gold. On rock taken from the ledge at the depth of 40 feet, the working test assay was \$75.60 per ton in gold. The ledge is four feet wide and holds the same width at the depth of 40 feet. He has also located another ledge lately, the Crown Point, which is near the other location. Quartz from his last location, assays \$113 per ton in gold. We understand that several rich prospects have been discovered lately on or around Muletown mountain, which is four or five miles southwest of Shasta. Work on the Black Bear, owned by Jos. Bell, of this place, is being vigorously pushed forward, and if capital could only be induced to take hold of other ledges on that hill, the bullion output of the county would be largely increased.

Sierra.

CLEAN-UP.—*Mt. Messenger*, Oct. 31: Ninety-three ounces were cleaned up from 870 carloads of gravel, result of five days' work of near 40 drifters last week at the Bald Mt. Extension drift mine. Sixty men are employed. The channel is narrowing some and being followed northeast up the ridge. As soon as water is more abundant, the force of drifters will be increased.

QUARTZ.—We learn that some good quartz has recently been found in the old Dreadnaught mine beyond Alleghany.

BEDROCK REACHED.—The parties who are running a tunnel under the slide below Shady Flat had about reached bedrock last Saturday. The tramway at the Phoenix mine is in running order, and it is expected that the mill will be run steadily after next Monday. H. P. Parker, P. M. of Sierra City, was down this week. We learn that Mr. Morris has got the quartz mill at Logaville running. The report is that Dick Marshall has found favorable prospects in the tunnel which he has been so many years running in Jim Crow canyon. It is reported to us that the shaft in the Empire mine, at Gold Valley, is in very rich quartz and sulphurets. Some of the rock shows free gold. The sulphurets, recently tested at Grass Valley, yielded \$176 to the ton.

Siskiyou.

DISCOVERIES.—*Siskiyou Telegram*, Oct. 30: Myron Carrick has made some new quartz discoveries on the Humboldt mountains, which give promise to be exceedingly rich. Some specimens in which gold could not be seen with the naked eye were pounded out, in our presence, some days ago, and on being panned out, were found to be filled with gold. The quartz, it is said, will assay away up in the hundreds of dollars to the ton.

NEW HOIST.—*Yreka Journal*, Oct. 28: The Allen Bros. started up their new steam hoisting machinery last week, which works fine. It was manufactured by Firth & Co. of San Francisco, who sent a man here to put it in working order. In testing the machinery some 18 skips or about 9 tons of quartz were taken out, which pays from \$80 to \$100 a ton in crushing. The owners of the mine will keep their hands at work for the next six weeks in sinking down on the ledge, and then commence stopping to get out a large quantity of quartz to keep their mill running all winter.

RICH.—At the Little Wonder quartz ledge on Cherry creek, worked by Jas. Ironsides and F. J. King, very rich prospects have been found. The vein is rather thin, but may widen out at greater depth. Mr. Ironsides has another rich ledge in the same vicinity from which he will soon have a lot of quartz crushed. Chamberlain & Cooley, who have been prospecting a ledge on the upper end of Greenhorn creek, continue to find rich quartz from a narrow vein, which they feel hopeful will develop into a good-sized ledge when followed into the mountain. David Starr has a small ledge of quartz at the head of Hull gulch, near Mugginsville, in Scott valley, which prospects exceedingly rich and may develop into a wide ledge yet. He pounds out money enough in a hand mortar to pay running expenses

of his claim and support a large family, and has been doing so for two years past.

DEEP PLACERS.—Mr. Lincoln of McAdams creek is now drifting deep placer mining ground in Quartz valley and realizes \$16 a cap of four feet wide, with 20 bands employed. The bedrock is 106 feet deep, and the pay gravel is raised by water-power hoisting works. Dave McCook has received a fine turbine wheel from Ohio, which arrived here last week, and is to be hauled over to Forks of Humboldt for running his quartz mill in place of steam. By using water-power for running day and night, a great saving can be made, as firewood and salary of engineer amount to considerable.

QUICKSILVER.—The Siskiyou Quicksilver Mining Co., operating on West Fork of Beaver creek, Siskiyou mountain, in this county, expects to fire up at the new furnaces to-day since being rebuilt. The company has a large quantity of very rich cinnabar ore on hand, to be put through the usual process of retorting. Some very good prospects have been discovered on the head of Beaver creek, in the placer diggings, and by next spring when the winter snow goes off, there will no doubt be a large number of miners in that section and in the vicinity of Hungry creek.

San Diego.

JULIAN DISTRICT.—*Sentinel*, Oct. 29: A conservative estimate of the present gold output of the Julian mines, including the Stonewall, places it at \$17,000 per month. Of this amount \$10,000 is expended at the mines for wages of miners, purchase of material and repairs, which sum eventually finds its way to the coast through the medium of stores and remittances for supplies. Prominent among those mines that are giving good returns is the Helvetia, whose fame right royally deserved has been spread afar by the press of our country. In this mine the pay shoot has been followed 100 feet, the vein varying somewhat in richness, but to-day there stands in the face of the drift a three foot vein of as rich ore as one could wish to see. The upraise that has been carried along with a height of 27 feet has not found an end to the rich rock. Eighteen men are kept at work here, day and night shifts being run.

The first clean-up of the mill on this bonanza ore was made Thursday, the result being a gold brick of big dimensions. The lessees of the Warlock are busily breaking down gold rock. The last crushing of ore from this mine averaged \$38 per ton. The Cincinnati Belle is kept steadily at work upon ore that would prove an eye opener to the man who believes there are no San Diego county mines. There is a curious freak of mother nature to be seen at the Ruby. The lower level of the mine follows a continuous ledge of very rich ore, while 30 feet above this in the upper level the vein consists of a succession of kidneys, with a narrow strip of waste between them, each kidney differing from the others in character of rock and richness. The greatest body of ore in the camp is to be seen at the Ready Relief, the property of the Bailey Bros. There is a labyrinth of tunnels, shafts, upraises, etc., and on every hand wide veins of ore of surpassing value. The elegantly equipped Gold King mine is employing a small force, with good ore in view. At the Waterman tunnel in the Blue hill mine work is progressing slowly. A large body of feldspar was recently met and cut through, then a streak of iron ore and the pick is now striking in feldspar again. Some experienced miners claim the indications in this prospect tunnel to be prophetic of a large body of auriferous quartz close by. Much has been said and written about the Stonewall in the past year, and the most conflicting reports have been circulated, some to the effect that the ledge had capped over, other reports were to say that the mine was working richer ores than ever before known in the history of the mine. There is no denying the facts that this magnificent property has been running smoothly for many months, employing a large force of men night and day, that an immense ore body is in sight and that the gold output is exceedingly gratifying to the heirs of Governor Waterman's estate. Not alone in gold does the miner necessarily have to wrap his attention, but the copper mine near Shaw's mill, not far from Julian, is being put in shape for extensive development. The excellent wioze and plant that was formerly at the Antelope has been put over the copper mine, and work can now be prosecuted to a greater advantage.

NEVADA.

Washos District.

SIERRA NEVADA.—*Virginia Enterprise*, Oct. 30: West crosscut No. 1, from the northwest drift, 630 level, 571 feet from the shaft, has been advanced 33 feet; total distance, 1221 feet; face in quartzite. The north drift from the Kenosha tunnel was advanced 44 feet; total distance, 241 feet; face in porphyry.

OCCIDENTAL.—Milled during the week 120 tons of ore of the average value \$19.10 per ton. Have stopped the mill for the present and resumed prospecting on the several levels. A crosscut from a south drift on the 350 level is entering the ledge and is showing some good ore. East crosscut on 750 level is in 18 feet; face in quartz and porphyry, giving low assays.

UNION SHAFT.—West drift from shaft, 900 level, has been advanced during the week 33 feet, making a total distance west of shaft 1296 feet; face in clay and porphyry.

ANDES.—On the 420 level enlarging shaft station. Completed repairs to main north drift. North drift from east crosscut No. 4 advanced 14 feet; continuing in quartz.

BULLION.—The east crosscut on the north line, 1300 level, is out 147 feet; face in clay and porphyry. Have been timbering during the week the south drift from winze station, 1400 level of Potosi.

SILVER HILL.—Northwest drift, 50 level, is out from shaft 425 feet; face in quartz and porphyry. South crosscut 160 level, is out from winze 790 feet; face in hard porphyry.

WARD COMBINATION SHAFT.—The southwest drift, 1800 level, is out from the shaft 560 feet; face in porphyry.

CHOLLAR.—The east crosscut on the south line, 1200 level, is out 135 feet; face in porphyry. The south drift from the incline station, 1500 level, is out 272 feet; face in porphyry.

UTAH.—East crosscut No. 1, 725 level, started from the southeast drift at a point 500 feet in, has been advanced 50 feet; face in clay and porphyry.

POTOSI.—East crosscut on south line, 1300 level, is out 147 feet; face in clay and porphyry. The

north and south drifts from the winze station, 1400 level has not been advanced during the week, owing to timbering the drifts. The south drift from winze station, 1500 level, is out 74 feet; face in soft porphyry.

ALPHA.—Have completed timbering shaft, and will resume work in the mine to-day.

EXCHEQUER.—Have completed shaft, and will resume work on the 600 level to-day. The joint southwest drift from Ward shaft, 1800 level, is out 550 feet; face in porphyry.

CON. NEW YORK.—The east crosscut No. 3 140 feet north of shaft, 650 level, is out 15 feet; face in clay and porphyry. The east crosscut, 700 feet north of shaft, 1100 level, is out 21 feet, the whole distance in quartz, some of which yields fair assays.

Hawthorne District.

LAPANTA.—Walker Lake *Bulletin*, Oct. 28: The body of ore below the Bradley incline still continues to show well. The north drift from the north upraise above the main tunnel still continues to show well, 660 ore.

PAMILCO.—Work is being pushed with the same force. All points showing well. Producing good ore.

CENTRAL.—Stopping still continues above the north drift. Stopes yielding very well.

FAIRMOUNT.—Still sinking the wioze below the tunnel and stoping above the south drift in the winze.

RIP VAN WINKLE (Marietta).—Main tunnel being pushed with two shifts. Formation changes—much softer; ore vein increasing in size and improving in quality.

Montgomery District.

THE BREVYFOGLE.—Walker Lake *Bulletin*, Oct. 28: J. G. Kaufman, who left Mason Valley some months ago for the Death Valley country, returned last Tuesday. He says there are some rich gold mines in that section, and reports that a Huntington crusher of ten-stamp capacity is being put in to work ore from one of the mines. It is not a poor man's country.

Jefferson District.

SALVATOR.—Belmont *Courier*, Oct. 30: We learn from Supt. T. A. Oliver that the work of laying the air-pipe in the Salvator mine at Jefferson is completed, and that the work of development will be prosecuted with energy.

Paradise District.

COPPER.—Belmont *Courier*, Oct. 30: From James Graham, of Grantsville, we learn that M. San Pedro expects to begin operations in the copper mines in Paradise district, Nye county, in the near future. These are undoubtedly valuable properties.

Jett District.

TO RESUME WORK.—Belmont *Courier*, Oct. 30: Messrs. Oliver and Warburton inform us that the mines in Jett and Pablo canyons, in this county, are looking well, and that work will be resumed on these properties on a large scale in the near future.

Cherry Orisk District.

PROMISING.—White Pine *News*, Oct. 31: Parties in from Cherry Creek inform us that the mining and business outlook over there is more promising than for some time past. The Egan and Ti-cup mills are being run on tailings, and the lessees at the former have already got out two nice bars of bullion. R. H. Frank has also started up his mill in Granite district. We would like to see all the boys make a stake before the hard winter sets in.

Whites Pine District.

HAMILTON.—White Pine *News*, Oct. 31: From Recorder Cupid, who spent a week or more looking around the great mining field adjacent to Hamilton, we get the information upon which the following items are based: The reported sale of the Cornell mine is off for the present, though its increasing output and fine showing of ore leaves little doubt but it will find a purchaser shortly. Cornell took out of his mine on the 20th instant, sacked and sewed, 150 sacks of ore of 130 pounds each, which averaged 27 ounces in silver and 65 per cent lead. This ore, after paying all expenses, will give a net return of \$32 per ton. Last week six carloads of ore were shipped from the district to Elko. Roco Kragnaize's mine, out on the Sherman town road, is a big thing, and the ore is of high grade, going 72 ounces in silver and 70 per cent lead. Ed Daily, Alex. Muir, J. B. Mathewson and "Brick" Pomeroy have struck a very promising prospect out on the Sherman town road. They are working it and taking out some very rich ore.

ARIZONA.

BULLION.—Prescott *Courier*, Oct. 30: Another shipment of bullion from the Tiger mining properties will soon be made. Machinery for the new five-stamp mill to be erected on the Segregated Paroelli mine is at the depot and will be loaded on wagons to-day for transportation to the mine. Lew Alters is in from the Antelope country; says nugget-hunting is still in progress on Rich Hill; that Wm. Parridge has a fine property in his extension of the Johnston mine, which he is working steadily. The Arizona Ore Co.'s works are kept pretty busy at present on custom ore, the main supply coming from the Crowned King and Catocin mines. Geo. Weckler was in town on Saturday last from the White Spar mine. This mine is the property of Messrs. Wickler & Snapp, is located about 14 miles south of Prescott in the neighborhood of the celebrated Catocin mine. It has been developed by a shaft 100 feet deep and a tunnel 140 feet in length; has a well-defined vein of silver ore two feet in width which yields \$250 to the ton.

MOHAVE COUNTY.—*Miner*, Oct. 31: Tom Burch was in town a few days this week in search of a pack-train to pack out a number of tons of ore from the Hope mine in Cedar. The C. O. D. concentrator is running along smoothly and turning out large quantities of concentrates. Experiments are being made with the machine to test its capacity for saving slummy ores. Henry Brown is in from Weaver and reports everything in a flourishing condition in that bonanza mining camp. The new road is now close to the river and will shortly be in condition for teams to pass over it. The Nighthawk tunnels are being driven in as fast as workmen can do it, and in each good ore is encountered. Supt. Bowers has returned and will prosecute work on the bonanza mine of Mohave county with a will. The ore recently shipped to San Francisco netted a handsome dividend to the owners. A number of arrastras are being run on the soft gold ore of Gold

Basin and are paying well. Several more it is expected will be built in Lost Basin and run on the rich ores of that region this winter. The barges on which the floating-wheel will be placed are being slowly worked up the river. The low water in the river makes the work of running the boats up stream rather slow. The mill will be located on shore at Green bay and will be of 25 tons capacity. It is expected that work will be started up on the Arnold mine, Cedar district, in a short time. Two lessees are at work on the mine, and are taking out rich ore. James Mulligan has for some time past been running a tunnel on the Big Bethel mine, one of the largest and best ledges in Mohave county, and has taken out an immense amount of good grade ore.

COLORADO.

SUB-LEASES.—Elk Mt. *Pilot*, 29: A number of sub-leases have been let on the Sylvanite mine, we believe, on the old workings, and W. J. H. Miller will turn his attention toward driving the crosscut tunnel. Supplies are going up from town for the winter. The crosscut tunnel, in the Snow Drift group, out near Pearl Pass, is about 700 feet, which is about far enough to cut the vein, which will be at a depth of about 700 feet. This property belongs to the Casson Bros. of Aspen, who deserve much credit for their perseverance. The machinery on the Cumberland mine is in place, and the air-compressor drill has started on its long journey of 1600 feet into the mountain. Many improvements have been made lately in the concentrating mill at Irwin. Steam power and steam heat are now being put in, preparatory to running the mill all winter. Hereafter the mill will be operated by the Irwin Milling and Power Co. This company is composed of P. F. Roppel, F. W. Fuller and Eastern parties. They contemplate further improvements next year, including the introduction of an electric power plant in connection with their water power, to furnish power for the operation of mines and mills at Irwin.

IDAHO.

POCATELLO NEWS.—Cor. Idaho *Statesman*, Oct. 30: The interest manifested here in the mines has not abated in the least, but on the other hand increases as each day brings more and more encouraging reports from the claims on which development work is being done. The mines in the townsites are the only ones on which actual and permanent work is being done. Those having claims on the reservation do not care to do more work than make locations until the reservation is thrown open. The mines in the townsites have never been properly described, and a brief outline of their formation may not be out of place. The galena veins are in a formation of blue limestone lying alongside of iron veins, which invariably run together as depth is reached. They are well-defined fissure veins and usually narrow at the surface, widening as they are worked down. The footwalls are of granite formation, the hanging-walls of blue limestone. The ores taken from the different veins are of different formations, some as foreign to the others as are the ore bodies of the Butte mining district. The Chief produces galena rich in silver, with average assays at \$65 per ton in lead and silver, while directly south is the Hungry mining claim, ore from which runs about \$75 in copper and silver. Again, the Bannock, north of the Chief, runs from \$25 to \$200 per ton in copper and silver. All the veins show gold. The Scarecrow lies immediately to the west of the Chief, and ore from it which is being taken out every day shows free gold. The strange formation has puzzled all the experts who have examined the ground.

ROCKY BAR.—Idaho *Avalanche*, Oct. 31: From a miner just arrived from Rocky Bar we learn that the Alturas mine, now going under the name of the Elmore, has just made a very rich and important strike that will bring this once-famous mine to the front again. The new strike is said to be in new ground, below the lower levels, found while sinking a winze. The ore is said to be exceedingly rich and the full width of the winze.

POORMAN.—From outside talk we learn there has been some very rich and important developments in this mine during the past few days.

RUTH.—The lower tunnel on this mine is being pushed ahead at the rate of 4 to 5 feet per day. At this rate it will not take long to reach the big shoot of ore opened in the tunnel above.

FLINT.—The mill at this camp is now running day and night on rich ore, plenty of water having been secured. A large force is at work putting in the new machinery.

MONTANA.

STRUCK IT RICH AGAIN.—*Inter-Mountain*, Oct. 29: Mr. Carter, the Gallatin Valley farmer who turned his attention to mining about a year ago, and whose every step in that direction has proven profitable to him, is again fortunate. It will be remembered that it was under Mr. Carter's lease of the Ground Squirrel that that property developed into one of the richest in Butte, and from which Mr. Carter realized a small fortune by selling out to the Butte & Boston Company. After giving up this lease, Mr. Carter did not abandon mining but looked around for something new, and about two months ago he secured a lease on the Manhattan lode, a property in a lot on Montana street, just below Porphyry. Within the past few days it has transpired that Mr. Carter has struck it rich again, his possession this time being a large body of ore that will go from 140 to 160 ounces to the ton. There is very little room for dumping ground in the vicinity, the neighborhood being thickly settled with dwelling houses. Mr. Carter is so elated with the discovery that he has concluded to explore the property to a greater depth and has placed an order with the Utah & Montana Machinery Co. for a new hoisting plant of 500 feet capacity.

NEW MEXICO.

LAST CHANCE.—Silver City *Enterprise*, Oct. 30: The Last Chance is coming to the front and is making a shipment of bullion weekly. The owners of this property are to be congratulated. Georgetown is not making much of a stir just now, yet development work is progressing steadily. When Gen'l Supt. Peby returns, sampling works will be put up on the Mimbres Co.'s properties. The Iron Head

mine of Hanover, was this week sold by Perry B. Lady, administrator of the Coomer estate. Price not stated. There seems to be a great deal of activity in iron mines at Hanover at the present time. Quite a number of mines in that district are under bond and several other sales are pending. Knott & Noel have let a 100-foot contract for sinking a well to Caesar Brock. They have \$10,000 worth of ore in the dump, and as soon as they get water, will have a five-stamp mill pounding in high-grade ore. The mill will be moved from its present location nearer to the mine. Malone will soon take on a regular boom.

OREGON.

QUARTZ.—Developments of a very promising nature continue to be made at the Steamboat quartz ledge, and Mr. Smith is sanguine that the vein of ore he has been looking for so long has at last been discovered. Work will be continued energetically. J. T. Wilson now has a shaft down 125 feet on the Patton ledge in Talent precinct for the company by whom he was employed to do the work. It prospects first-class at present, and all parties interested are hopefully awaiting developments. Henry E. Ankeny, superintendent of the Sterling mine, informs us that the water supply is increasing steadily, and he expects to have enough water to run one pipe in a very short time. The ditch is now being put in repair, and some bedrock that was not cleaned up will probably be attended to first.

PLATINUM.—A platinum mine has been discovered about six miles from Grant's Pass, in the Louse Creek country. Wm. Platt, who brought in specimens of ore last Saturday, declined to tell the exact location, but that he has a good lead seems evident. Platinum is more precious than gold, as it is used largely in electric lighting.

The Woodbury Concentrator.

It is little more than a year since these machines were placed on the market. That they are finding much favor among millmen is evident from the following list of concentrators sold and in daily use, furnished by Geo. E. Woodbury, the inventor and manufacturer:

Keystone Mining Co., Amador City, Cal.; 5; Francis, Valentine & Co., Hathaway mine, 4; A. Halsey, Mother Lode mine, 2; B. F. Hartley, Anburn, Cal.; 2; Gover Mining Co., Amador City, Cal.; 5; W. S. & S. W. Chapman, Georgetown, Taylor mine, 4; Mary Murphy Mining Co., Romley, Colorado, 12; Bell Maxwell, Balfview mine, Sonora, 2; Pat Murphy Mining Co., St. Elmo, Colorado, 5; John Porshaoker, Mexico, 2; Jewel M. Co., Grant's Pass, Oregon, 1; Yankee Boy mine, Colorado, 1; S. S. Badger, Orray, Colorado, 5; So. Spring Hill M. Co., Amador City, Cal.; 2; San Joaquin Estate tin mine, Temescal, Cal.; 1; W. H. Flanagan, Grant's Pass, 1; W. H. Howland, Casco mine, Jackson, Cal.; 2; Wineford Mining Co., Arizona, 2; Sailor Jack mine, Shingle Springs, Cal.; 1; Centennial Chief M. Co., Leadville, Colo.; 2; Golden State Miners' Foundry, San Francisco, 1; Rand Drill & Rocaock Co., Sydney, Australia, 1; J. J. Chapman, Jackson, Cal.; 1; Edward Price, Breckenridge, Colorado, 4; Quartz Mining Co., Amador City, Cal.; 5; G. G. Hoher, Silverton, Colorado, 2; C. H. Reno, Galena, Nevada, 2; American River Syndicate, 4; Hendric & Boltz, Denver, Colorado, 2.

Eighty-three machines in about 15 months is a pretty good showing. The kind of satisfaction that they are giving is shown by the accompanying letter from the manager of the Temescal tin mine:

THE SAN JACINTO ESTATE,
OFFICE OF GENERAL MANAGER,
CAJALEO, Oct. 30, 1891.

Geo. E. Woodbury, Esq.—DEAR SIR: In reply to yours of the 27th inst., respecting the working and efficiency of the "Woodbury" concentrator placed in our works by you, I am pleased to inform you it is giving entire satisfaction; it has a much greater capacity than any other machine, and is doing fully one-third more work, with the concentrator equally clean, as from either of the machines at work here. I am yours faithfully,

[COPY.] S. HARRIS, Mine Manager.
P. S.—The machines referred to above are the Frues and Triumphs.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Nov. 5, 1891.

General trade continues fairly active. The feeling of confidence in the future is more strongly riveted in commercial circles than has been known for years. Money is becoming plentiful, with interior merchants paying up better than at any time for almost five years past. Iron importers report a large demand for pig, causing a firmer market. The collapse of the molders' strike is accepted as favorable to future business here. The last Australian steamer brought in about \$1,200,000 in sovereigns. The imports of gold from that colony has, so far this season, been quite large. The Eastern money market is very easy. The following from a New York exchange reflects the situation there: "The financial outlook, from the bankers' and mercantile standpoint, improves from week to week. The predictions of optimists have been more than verified up to this date. Bankers are gratified in observing the free return of gold from Europe, which was believed to have been necessary to avert a crisis of some severity. It comes in season to meet a demand of at least \$3,000,000 a week from the interior to move the crops. The calculation is made in a general way that a favorable balance in the foreign trade, equal to something like \$200,000,000, must be liquidated by sending either gold or its equivalent in merchandise or securities. Exports of grain alone will call for \$150,000,000, and as a great deal of imported merchandise remains unsold on account of overstocking previous to the new tariff, it is reasoned that imports for some time will be on a reduced scale. Cotton, too, will continue to go abroad in large quantities, both raw and manufactured, but at a valuation which, for the present, cannot be determined. Altogether the prospect is good for a return of gold equal to or even in excess of the temporary loss. Americans, therefore, reasonably look for easy money."

QUICKSILVER.—Receipts the past week were 466 flasks Californian and 400 flasks Spanish, via China, en route for Mexico. The market is very strong at full figures. Oregon advices report a favorable outlook for opening the mines in Southern Oregon.

MEXICAN DOLLARS.—The market is essentially unchanged at about 74 1/2 cts. The weak markets ruling for silver are against Mexican.

SILVER.—The markets abroad and at the East have been gradually sinking, with slight fluctuations. It is difficult to get to the true inwardness of the depression further than a prevailing opinion that it is the work of a strong manipulating monied syndicate for future operations on the bull side. It is semi-officially announced that our Government is making overtures to European Governments looking to an international agreement on silver. It is also stated that the outlook is quite favorable for its accomplishment. The success of the Democratic party in New York and Massachusetts and its defeat in Ohio is accepted by Wall street and financiers generally as committing that party against buying and storing silver in bars.

LIME.—Receipts the past week aggregate 3614 hhls. The demand is only fair. The output appears to be regulated by demand.

BORAX.—Receipts the past week aggregate 455 cts. The market is strong under reports of a new pool being formed to more fully control the output of this coast.

LEAD.—The market is heavy, with quotations barely steady. At the East, an unsettled feeling is reported.

TIN.—The market is weak and irregular. Higher outward charters from England offset any decline in prices of plate there. A large English works—the Abercane—has closed for the want of remunerative business, this has caused a drop in pig abroad.

COPPER.—There appears to be a growing feeling that for the time at least the lowest prices have been touched, or, in other words, the starting up of the Anaconda mines was discounted. A London cable to the *Iron Age*, Oct. 29th, says: Copper has been unsettled and depressed, with many holders alarmed at the aggressive action of the "bear" party and reported reopening of the Anaconda mines, with promised large production. Some good buying took place at the lowest prices, and reduced offering has restored confidence in some degree. A great deal of copper has passed into strong hands, and it is suggested that the market has been smashed by powerful operators interested in Rio Tinto and other mining shares. The consumption is good and an increased demand for sulphate is noted.

IRON.—The local market, after sinking to lower figures than ever before, appears to be gaining in strength. It is said that heavy buying has caused a better concentration of supplies both on spot and to arrive. Higher outward English charters are against shipments from that quarter except at higher prices. Imports at this port the past week aggregate 280 tons from Swansea.

COAL.—Imports the past week aggregate 21,923 tons as follows: From Tacoma, 6400 tons; Coos Bay, 490; Comox, 4450; Seattle, 4410; Newcastle, N. S. W., 1350; Departure Bay, 1200; Liverpool, 2100; Swansea, 1508. The spot market and nearby cargoes continue in buyers' favor. Yard room is scarce, which causes lower prices for cargoes that require immediate discharging. Absence of cold weather is against a strong demand for household coals, but the consumption of steam continues large. It is conceded that present low prices will continue until well into 1892. Higher outward charters at Australian and English ports are against shippers.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Mining Share Market.

Mining shares the past week were decidedly mixed, mixing up chippers and outside operators in their opinions regarding which way the "cats" will go in a most beautiful chaotic condition. The pool is unable to longer disguise their hands, for it is too plainly evident they are determined to milk the street of every share possible before starting the bull campaign that is certain to come. In several mines they are uncovering good milling to high-grade ore, which will pay handsome returns for milling. Before the MINING AND SCIENTIFIC PRESS commenced, over three years ago, an active crusade against the manner in which several of the Comstock mines were being looted, the rings feared no one and cared very little whether they owned stocks or not, so long as they controlled the mines through the pernicious proxy system and got all they wanted (the hullion), while outside shareholders got the assessments. This paper's course was largely instrumental in calling into life the Mining Stock Association, which for all of three long years has made a strong fight against the rings, and which at this writing promises to prove a glorious victory for the right. The stock pools, mill rings and kindred organizations, seeing defeat certain, for months past have been making every effort to compel outsiders to sell their stocks. Driven to their last ditch, they appear to be making their last desperate move and are throwing bombs (assessments) right and left, and by every other means possible, trying to create complete demoralization, so as to make more successful bear raids. They know that in several mines a more encouraging outlook was never before had, and stocks they want so as to get the dividends which must come sooner or later now that they are in a fair way to be prevented from looting the mines. The writer still maintains the opinion expressed last week, that although quotations for shares may be manipulated lower, yet the person who buys stocks and pays cash, and pays one assessment, if it comes before a rise in prices, will have no occasion to regret the venture. The trouble with the public is, they have no time to make money; if they buy they want immediate results, forgetting that the large and successful operator often waits several years after buying so as to net a handsome profit, which, when it comes, he gets by selling at the time gudgeons are buying. Outsiders often buy more than they can pay for, and in consequence stand between two fires, one in being sold out if stocks go down and the other in the broker failing if stocks go up.

The pool is using Con. Virginia as a lever to milk the street of the stocks, they are particularly desirous of buying. They also appear to be assessing those they want, and are putting out points that no stock, except Confidence, in the Middle or Gold Hill groups will sell at much, if any, over \$1 a share before the bull campaign starts in. While the writer does not know if these points be correct or wrong, he does say that the situation in the mines warrants much better prices.

News from the Comstock mines continues to be suppressed so as to more successfully manipulate stocks to get them better in hand at lower prices. In Sierra Nevada, Union, Mexican and Ophir the good news that is now kept back can be looked for at almost any day after this month. In Con. Virginia they ought to report within the next three or four weeks a strike on the 1700-foot level. The 1800-foot level is being developed for extracting ore that should cause the mine to resume dividends. In Best and Belcher, and also in Gould and Curry, favorable news is kept back.

In both Hale and Norcross and Savage they are uncovering rich and large ore deposits. In the latter mine on the Suto tunnel level, there were several thousand tons of ore dumped years ago, which should be taken out and milled as it is extracted; the cost would only be for hoisting, transporting and milling, and as the ore assays quite high, dividends should be paid from it. When the Suto tunnel stopped work in Savage, the face of the tunnel was in high-grade ore. The ore is still there. From the Ward Shaft a drift was run into Exchequer and a strike was made, but which the officials failed to report. In Con. Imperial, Challenge and Confidence, and extending into Alpha, very important work is being done, but particulars are kept back. They ought soon to have the water pumped out below the 1700-foot level in Yellow Jacket, Kentucky, Crown Point and Belcher mines, which, when done, will enable them to extract for milling the high-grade ore on that level that the late Senator Sharon was unable to take out, owing to the mines not being able to handle the water. When work was stopped the face of the crosscut on that level was in high-grade ore. Is it not about time for Overman to show up higher grade ore? It looks as if all outsiders are about frozen out of their stock. In Potosi and Bullion active development is still under way on several levels; particulars are held back so as to buy cheap stock. When the present freeze-out in the Alta group is over, good news is in order from that quarter.

From the outside mines, favorable news continues to come to hand, yet the market is made sick so as to encourage outside selling and discourage them from buying.

Mining shares opened this (Thursday) morning dull and heavy, with outsiders selling. Quite a number of large outside accounts were closed out the past week. The Middle and Gold Hill stocks are about as low as they generally get; at any rate, a buyer does not, in the writer's opinion, run much if any risk at present prices, provided he pays cash.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department 10, San Francisco:

ATMOSPHERIC PAINT COMPOUND CO. Oct. 23. Capital stock, \$100,000. Directors—John Sorenson, E. Jungerman, W. B. Frederick, Henry Behneman and James E. Watson.

IOWA DITCH CO. Oct. 30. Object, to dig a ditch in Fresno county, starting at Fowler Switch canal. Capital stock, \$24,000. Directors—E. H. Miller, F. S. Donly, L. J. Holton, S. Gewer and B. W. Hartie.

HARKNESS G. M. CO. Nov. 1. Capital stock, \$1,000,000. Directors—Alfred Dixon, J. E. Chapman, W. S. Chapman, A. P. Moore and E. F. Stine.

461,940.—RUNNING GEAR FOR VEHICLES—R. L. Kirby, Pomroy, Wash.
461,842.—HOUSEHOLD ARTICLE—A. J. McDonald, Blaine, Wash.
462,014.—ELECTRIC RAILWAY—G. W. McNear, Oakland, Cal.
462,099.—BUNDLE WRAPPER FOR CIGARS—A. & J. Michaltschke, S. F.
462,015.—TRUSS—Robt. Nagler, S. F.
461,984.—FOLDING LADDER—Wm. M. Penry, Jackson, Cal.
462,165.—SHOW TABLE AND BEDSTEAD—M. Rosenbaum, Tacoma, Wash.
461,986.—GATE—T. Scheibel, Santa Rosa, Cal.
461,987.—DERRICK FORK ATTACHMENT—J. S. Scott, San Jose, Cal.
462,173.—REIN GUARD—J. N. Southrey, Stockton, Cal.

The following brief list by telegraph, for Nov. 3, will appear more complete on receipt of mail advices:

California—George Bryant, San Francisco, shoe; Frederick W. Dohbel, Purleima, eight for firearms; Wesley Gibbs, Los Angeles, piano action regulator; Peter H. Gibson, San Francisco, construction of floors or walls; John Kerwin, Beckwith, lever-power mechanism; Emma Martel, San Francisco, curtain-pole supporter; Edward North, Newhall, check-book; Almarin E. Paul, San Francisco, apparatus for treating gold and silver ores; Henry Richmond, Santa Cruz, rotary air compressor and pump; Michael C. Taylor, Grass Valley, bedstead; Charles S. Weber, San Jose, stringed instrument; George F. Wells, San Francisco, automatic organ.

Notes.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ELECTRIC RAILWAY.—Geo. W. McNear, Oakland, No. 462,014. Dated Oct. 27, 1891. Although this invention is applicable to all kinds of electric conductors whether arranged overhead or in subways, it is shown in its most applicable form in a subway or conduit. The object of the invention is to thoroughly insulate the electric conductor. Dependent from the under side of the conduit are brackets arranged at suitable intervals and insulated. The brackets carry an insulating sack, which is in the form of a closed tube made of some suitable insulating material—preferably rubber—which is sufficiently flexible in its nature as to admit of being collapsed. Within and confined wholly by the insulating sack, is the metallic electric conductor, which, together with the insulating sack, extends the whole length of the conduit. The under surface of the electric conductor within the sack is exposed to the contact of pieces carried by the sack, and which are adapted to be pressed against the conductor by the passing trolley of the car on the tracks overhead. At the same time the electric conductor is so enclosed that there is no wastage such as is common in electric conductors.

DERRICK FORK ATTACHMENT.—Jasper S. Scott, San Jose, No. 461,987. Dated Oct. 27, 1891. This is an attachment for that class of implements known as "derrick forks," and its object is to provide a convenient means for transporting straw from the stack to a point where it is to be delivered to the thrashing machine or other place of deposit. By the construction adopted a connection is formed with the derrick fork after the load has been discharged so as to hold it up until it shall have traveled down the inclined rope to a point above the stack, after which it is released from a ring and allowed to drop directly upon the stack. If it were not for some device of this sort, as soon as the hoisting rope was relieved of the tension the fork would simply be lowered at the point above which it was at that time suspended, while by means of this device it is prevented from being lowered until it reaches the point where it is desired to lower it upon the stack. By the arrangement described in the patent, the loaded fork is moved up the incline, the load discharged at the desired point and the fork retained in its suspension from the traveler until it is again moved down the incline to a point where it is to be dropped upon the stack.

GATE.—Theobald Scheibel, Santa Rosa, No. 461,985. Dated Oct. 27, 1891. The gate is suspended by rollers traveling upon a horizontal guide or track. A lever is pivoted in the center post and its end passes through a slotted guide upon the gate, which has suitable anti-friction rollers at each end. The levers which extend out in each direction along the roadway have their inner ends connected with the centrally pivoted lever above mentioned, and when either of them is pulled down, the inner end pulls this lever up and this acts upon the gate to cause it to slide along until the lever has moved over and passed the center, when its weight is added to the momentum of the gate and assists to finish the movement. Suitable locking catches hold the gate at either end of its travel, these being disengaged by the first upward movement of the lever.

TRUSS.—Robert Nagler, S. F., assignor of two-fifths to Frederick Wegman, No. 462,015. Dated Oct. 27, 1891. This invention relates to certain improvements in trusses which are applicable to persons afflicted with rupture. By the adjustments described in the patent the pad can be moved into various positions, the belt may be reversed, and by taking the slide out and introducing it into the other end of the guide-plate the same belt may be worn upon either side. The guide-plate may also be shifted or turned upon the end of the spring so as to apply the pad to a navel rupture or any part where it may be needed.

MECHANICAL PROGRESS.

New Manufacturing Processes.

At one of the Pittsburgh, Pa., machine shops a new process has recently been introduced in the manufacture of compound metallic tubes, that is, tubes of one metal covered or lined, or both, with another metal. In the lining of a tube, a hard mandrel is taken, the diameter of which is the same as desired for the inside of the lining of the tube when finished, and the metal lining is placed around the mandrel and rolled through or between hard surfaced rolls until the lining is reduced to the desired thickness; the tube that is to be lined is now slipped over the lining, and the rolling process continued until the tube is rolled tightly on to the lining and reduced to the outside diameter desired, after which the mandrel is removed and the tube cleaned. If the tube is to be covered as well as lined, the mandrel is left inside the lining, the metal cover is slipped over the tube, and the rolling process continued in the same manner until the metal cover is rolled down tightly upon the outside of the tube and the degree of thickness of the covering sought for is obtained. After this, the mandrel is removed and the compound tube finished according to the usual method.

A Shell of Tinned Steel Inserted in an Iron Kettle.

In the same direction of improvement with the above, we have the statement that an English inventor has patented a process for lining hollow ware in a superior manner without increasing the cost of manufacture. This invention consists in substituting a steel-tinned lining, either spun or cast, in the iron pan, instead of the ordinary process of tinning or enameling. It is claimed for the new method that it effectually prevents the appearance of any sand, or pin-holes, or roughness, so that the interior of the saucepan will present a smoother and brighter appearance than can be secured under previous methods of manufacture. The costly process of burning and annealing can be dispensed with in operating this process. It is intended to apply the process to lining articles with brass or copper instead of tinned steel, thereby producing what is to all practical purposes a copper or brass pan at the same price as an ordinary tinned one.

A PROMISING RAILWAY INVENTION.—What may possibly become a useful device in railway locomotion is alluded to as follows: An interesting invention is now undergoing thorough investigation which promises much for the improvement of railway traffic, both in increasing the safety of railroading and the pulling capacity of a locomotive. The invention consists of a small dynamo and an auxiliary engine placed upon the locomotive in such a way as to be easily operated, furnishing a current of small force but large quantity, which is made to pass from one pole of the dynamo to one pair of driving wheels, thence along the rail to the other pair of driving wheels, thence to the other pole of dynamo, thus forming a traveling circuit, moving at all times with the locomotive. By means of this circuit an incipient weld is caused between the wheels and rails at the point of contact, preventing the slipping of the wheels. The working model of the device it is said, shows a very large increase in the hauling power of the locomotive. The model, without the application of the current, would not mount a grade of 15 per cent, but when the current was applied it mounted a grade of 35 per cent. A locomotive is now being equipped with the invention to test it on the Baltimore & Ohio railway.

ONE OF THE LARGEST ENGINES IN THE COUNTRY, which is working in a Pennsylvania sink mine, recently came to grief in a very sudden manner. The engine was known as "The President." While the engine was working and connected with an extra pump, one of the two large walking beams which connect the engine with the pumps broke in four pieces and the powerful piece of machinery came to a sudden halt. The broken walking beam weighs 24 tons, and is the largest in the country. When the engine was set in position some years ago, it required a team of 42 mules to haul each of the walking beams from the Union depot over the mountain to Friedensville. The builder of the engine was hastily summoned to the mine to repair the broken beam. Efforts will be made to put it in temporary use while a new one can be obtained. In the meantime the great mine is rapidly filling up with water.

RAWHIDE NOISELESS GEARS.—We have already made reference to the invention of noiseless rawhide gears. It is now reported that a company has been organized to manufacture gears under this patent, and that the company has announced to the mechanical world that they have succeeded in producing that which has been so long and vainly sought, strictly noiseless gears, as strong and durable as iron. The statement at first was not easily credited. Time, however, which tries all things, has, it is said, conclusively verified their claim. Their patent rawhide gears are now in general use on electric roads, and by many prominent builders of machinery throughout the country, and the demand for them is steadily increasing. They are made of solid rawhide from the huts of steer hide exclusively, used by patent process, which removes all

useless matter, condenses the hide, and entirely obviates shrinking. It is claimed that these gears will transmit fully as much power as iron gears of the same size. They can be run together or against metal gears. There are no plates, collars, bushing, bolts nor metal in any form used.

Mushet's Special Steel.

This steel, so deservedly popular among those who perform work on metals that is severe on tools, was introduced into the United States about 20 years ago, and quickly gained favor among machinists. It is particularly noted for hardness, endurance and uniformity, characteristics that have never been successfully imitated, although attempts to that end have been very persistently carried on. With tools made from this steel, machinists are enabled to run their machines at a greatly increased rate of speed, and thereby turn off a very much larger amount of work in a given time than it would be possible to do with any other known steel.

The steel is made by a secret process, which produces the peculiar hard and uniform characteristics of the material. The results obtained appear to be due to manipulation alone, for the most careful chemical analyses fail to indicate wherein the Mushet steel differs from many other brands of good tool steel. The steel certainly holds a very unique position among metals in respect to its constructive properties and its well-known economic advantages. We must confess that the former interests us most, and in this connection we recall to mind the recent words of a scientist to the writer: "We may analyze the forces of nature and to some extent harness them to our use; but could we combine them, we should be gods and not men."

This want of combination is the principle that has prevented any really successful imitation of the "Mushet's" steel; the want of combination in which the elements have especial reference to order, place and adaptability, without which the material becomes, comparatively speaking, a mere agglomeration. This idea is proved and forced upon us by the fact that many honest efforts have been made to make steel like the "Mushet's," the results of which have been that while self-hardening has been attained, the displacement of elements has been such as to greatly impair its effective service, and just at this point all imitators of "Mushet" are at sea!—*Natural Gas and Locomotive Builder.*

THE RELATIVE TEST OF NEW AND OLD METAL.—The fatigue of metals under continuous strain has long been a subject of discussion. *The Electrician* of London, in a recent report on the subject, says: "A square iron link 12 inches wide, 1 inch thick, and about 12 feet long, was taken from a bridge at Kieff, then about 40 years old, and tested against a similar link which had lain unused in store ever since the building of the bridge. The means of comparison was, therefore, excellent, and the result should go a long way to show whether or not iron really does lose any of its strength in prolonged service. The effect of the tests was to determine for the old used link an ultimate tensile strength of 21.8 tons per square inch, an elastic limit of 11.1 tons per square inch, an elongation of 14.05 per cent, and a contraction of 17.35 per cent at the point of fracture. For the unused link the tensile strength was found to be 22.2 tons per square inch, with an elastic limit of 11.9 tons, and elongation and contraction at fracture of 18.42 per cent and 18.75 per cent respectively. The two pieces of iron were, therefore, of practically identical strength; for the small difference actually observed is well within the ordinary range of variability of similar pieces of the same metal."

CHAIN IRON.—The first requisites of a high-class chain iron are well understood to be elasticity, combined with excellent welding qualities and a reasonably high tensile strength, so that the chain made from it may be in the best possible condition to resist the sudden shocks and strains to which cranes and other chains doing similar duty are continually subjected. A brittle iron possessing merely the quality of resisting a high tensile strain, steadily applied, as in a testing machine, is utterly unfitted for use in a high-class chain, since being defective in the quality of yielding by its elasticity to shocks, and readily recovering itself without fracture, it fails, by breakage, with a suddenly applied strain, which an elastic iron will support without detriment. The principle of submitting all chains to the additional test of sudden shock or jerk from a falling weight, or similar method, would be an excellent means of ensuring a proper quality of iron being used in its manufacture.

THE LARGEST GUN EVER MADE BY KRUPP is the property of the Russian Government. It is made of cast steel, and has a barrel 40 feet long, with a bore of 13½ inches. It costs \$1500 to fire a single shot from the gun.

It is stated that the wear and rusting of the steel rails amount in weight in a given time to just about opposite proportion to the tensile strength of the metal.

The portion of a locomotive the most subject to wear is the crank pin, its life being 60,000 miles; 66,733 will constitute the life of a 33 inch wheel.

SCIENTIFIC PROGRESS.

Study and Utilization of the New Metals.

Prof. W. C. Roberts-Austin, in his address at the recent meeting of the British Association for the Advancement of Science, mentioned the great importance of extending the use of the less-known metals. Attention is now concentrated on the production of aluminum, which is being turned out in considerable quantities by methods that will doubtless soon lead to a rapid increase in the number of metallurgical processes. Sodium is growing in importance, not only in cheapening the production of aluminum, but as a powerful weapon of research. Forty years ago, magnesium was a curiosity; now its production is a considerable industry. We may expect to see barium and calcium produced on a large scale as soon as their utility has been demonstrated. Minerals containing molybdenum are not rare, and the metal could probably be obtained as cheaply as tin if a use were found for it. The quantities of vanadium and thallium, which are available, are far from inconsiderable; but we know little of the action of any of these metals when alloyed with others which are in daily use. The field for investigation is vast indeed, for it must be remembered that valuable qualities may be conferred on a mass of metal by a very small quantity of another element. The useful qualities imparted to platinum by iridium are well known. A small quantity of tellurium obliterates the crystalline structure of bismuth; but we have lost an ancient art which enabled brittle antimony to be cast into useful vessels. Two-tenths per cent of zirconium increases the strength of gold enormously, while the same amount of bismuth reduces the tenacity to a very low point. Chromium, cobalt, tungsten, titanium, cadmium, zirconium and lithium are already well known in the arts, and the valuable properties which metallic chromium and tungsten confer upon steel are being generally recognized; but as isolated metals we know little of them. A reward awaits the chemists who shall raise alloys from the obscurity in which they are at present left.

The Origin of Tornadoes.

Nothing is more justly dreaded, nor more mysterious in its origin, than the tornado. Its excessive violence, the narrow limits within which the winds whirl around, and their sudden coming and short stay, deepen the mystery attached to the tornado; and while much has been written of these visitations, it has been rather a description of their appearance and of the havoc wrought by them than an explanation of their character and movement. The theory by which the tornado has been generally explained ascribes to it the whirling ascent of a mass of inflowing air from all sides, the effects being complicated by the combination of the whirling with the progressive advance of the vortex.

William M. Davis points out that tornadoes do not only whirl, but they nearly all whirl from right to left or "against the sun." This movement, he argues, cannot, therefore, be accidental; it must be regulated by some controlling antecedent—an inheritance from some preceding condition. It has been made clear that tornadoes are generated within the area of the large cyclonic storms to which we owe our spells of cloudy, rainy weather. These cyclonic storms are areas of low barometric pressure, with their winds moving in great inward spiral currents, and always, in our hemisphere, turning from right to left. When a subordinate whirl is set up in a larger whirl, the little one will begin to turn in the same way that the larger one is turning. Our tornadoes, therefore, whirl because the parent cyclones in which they are bred also whirl, the turning in the same direction being a clear case of inheritance—the offspring taking after the parent.

But if the tornado have inherited the habit of whirling from the cyclone, from what ancestor did the cyclone receive it? The fact has been discovered, through data gathered in all parts of the world, that our cyclonic storms march in an irregular procession around the north pole, along with the great north polar whirl of the terrestrial winds. If the great polar whirl should stop, the cyclonic storms also would almost disappear; but this it would be well nigh hopeless to expect.
